The princes of Europe should really consider whether as a matter of fact they can dispense with our services--with us, the immoralists. We are to-day the only power which can win a victory without allies: and we are therefore far and away the strongest of the strong. We can even do without lying, and let me ask what other power can dispense with this weapon? A strong temptation fights for us; the strongest, perhaps, that exists--the temptation of truth.... Truth? How do I come by this word? I must withdraw it: I must repudiate this proud word. But no. We do not even want it--we shall be quite able to achieve our victory of power without its help. The real charm which fights for us, the eye of Venus which our opponents themselves deaden and blind--this charm is the magic of the extreme. The fascination which everything extreme exercises: we immoralists--we are in every way the extremists.

750.

The corrupted ruling classes have brought ruling into evil odour. The State administration of justice is a piece of cowardice, because the great man who can serve as a standard is lacking. At last the feeling of insecurity becomes so great that men fall in the dust before any sort of will-power that commands.

751.

"The will to power" is so loathed in democratic ages that the whole of the psychology of these ages seems directed towards its belittlement and slander. The types of men who sought the highest honours are said to have been Napoleon! Cæsar! and Alexander!--as if these had not been precisely the greatest _scorners_ of honour.

And Helvetius would fain show us that we strive after power in order to have those pleasures which are at the disposal of the mighty--that is to say, according to him, this striving after power is the will to pleasure--hedonism!

752.

According as to whether a people feels: "the rights, the keenness of vision, and the gifts of leading, etc., are with the few" or "with the many"--it constitutes En oligarchic or a democratic community.

Monarchy represents the belief in a man who is completely superior a leader, a saviour, a demigod.

Aristocracy represents the belief in a chosen few--in a higher caste.

Democracy represents the disbelief in all great men and in all elite societies: everybody is everybody else's equal, "At bottom we are all herd and mob."

753.

I am opposed to Socialism because it dreams ingenuously of goodness, truth, beauty, and equal rights (anarchy pursues the same ideal, but in a more brutal fashion).

I am opposed to parliamentary government and the power of the press, because they are the means whereby cattle become masters.

754.

The arming of the people means in the end the arming of the mob.

755.

Socialists are particularly ridiculous in my eyes, because of their absurd optimism concerning the "good man" who is supposed to be waiting in their cupboard, and who will come into being when the present order of society has been overturned and has made way for natural instincts. But the opposing party is quite as ludicrous, because it will not see the act of violence which lies beneath every law, the severity and egoism inherent in every kind of authority. "I and my kind will rule and prevail. Whoever degenerates will be either expelled or annihilated."--This was the fundamental feeling of all ancient legislation. The idea of a higher order of man is hated much more profoundly than monarchs themselves. Hatred of aristocracy always uses hatred of monarchy as a mask.

756.

How treacherous are all parties! They bring to light something concerning their leaders which the latter, perhaps, have hitherto kept hidden beneath a bushel with consummate art.

757.

Modern Socialism would fain create a profane counterpart to jesuitism: everybody a perfect instrument. But as to the object of it all, the purpose of it--this has not yet been ascertained.

758.

The slavery of to-day: a piece of barbarism. Where are the masters for whom these slaves work? One must not always expect the simultaneous appearance of the two complementary castes of society.

Utility and pleasure are slave theories of life.

"The blessing of work" is an ennobling phrase for slaves. Incapacity for leisure.

759.

There is no such thing as a right to live, a right to work, or a right to be happy: in this respect man is not different from the meanest worm.

760.

We must undoubtedly think of these things as uncompromisingly as Nature does: they preserve the species.

761.

We should look upon the needs of the masses with ironic compassion: they want something which we have got--Ah!

762.

European democracy is only in a very slight degree the manifestation of unfettered powers. It represents, above all, the unfettering of laziness, fatigue, and _weakness_.

753.

Concerning the future of the workman--Workmen men should learn to regard their duties as _soldiers_ do. They receive emoluments, incomes, but they do not get wages!

There is no relationship between _work done_ and money received; the individual should, _according to his kind,_ be so placed as to _perform_ the _highest_ that is compatible with his powers.

764.

Noblemen ought one day to live as the bourgeois do now--but above them, distinguishing themselves by the simplicity of their wants--the superior caste will then live in a poorer and simpler way and yet be in possession of power.

For lower orders of mankind the reverse valuations hold good: it is a matter of implanting "virtues" in them. Absolute commands, terrible compulsory methods, in order that they may rise above mere ease in life. The remainder may obey, but their vanity demands that they may feel themselves dependent, not upon great men, but upon principles.

765.

"_The Atonement of all Sin?_"

People speak of the profound injustice of the social arrangement, as it the fact that one man is born in favourable circumstances and that another is born in unfavourable ones--or that one should possess gifts the other has not, were on the face of it an injustice. Among the more honest of these opponents of society this is what is said: "We, with all the bad, morbid, criminal qualities which we acknowledge we possess, are only the inevitable result of the oppression for ages of the weak by the strong"; thus they insinuate their evil natures into the consciences of the ruling classes. They threaten and storm and curse. They become virtuous from sheer indignation--they don't want to have become bad men and _canaille_ for nothing. The name for this attitude, which is an invention of the last century, is, if I am not mistaken, pessimism; and even that pessimism which is the outcome of indignation. It is in this attitude of mind that history is judged, that it is deprived of its inevitable fatality, and that responsibility and even guilt is discovered in it. For the great desideratum is to find guilty people in it. The botched and the bungled, the decadents of all kinds, are revolted at themselves, and require sacrifices in order that they may not slake their thirst for destruction upon themselves (which might, indeed, be the most reasonable procedure). But for this purpose they at least require a semblance of justification, _i.e._ a theory according to which the fact of their existence, and of their character, may be expiated by a scapegoat. This scapegoat may be God,--in Russia such resentful atheists are not wanting,--or the order of society, or education and upbringing, or the Jews, or the nobles, or, finally, the well-constituted of every kind. "It is a sin for a man to have been born in decent circumstances, for by so doing he disinherits the others, he pushes them aside, he imposes upon them the curse of vice and of work.... How can I be made answerable for my misery; surely some one must be responsible for it, or I could not bear to live."...

In short, resentful pessimism discovers responsible parties in order to create a pleasurable sensation for itself--revenge.... "Sweeter than honey"--thus does even old Homer speak of revenge.

***

The fact that such a theory no longer meets with understanding--or rather, let us say, contempt is accounted for by that particle of Christianity which still circulates in the blood of every one of us; it makes us tolerant towards things simply because we scent a Christian savour about them.... The Socialists appeal to the Christian instincts; this is their really refined piece of cleverness.... Thanks to Christianity, we have now grown accustomed to the superstitious concept of a soul--of an immortal soul, of soul monads, which, as a matter of fact, hails from somewhere else, and which has only become inherent in certain cases--that is to say, become incarnate in them--by accident: but the nature of these cases is not altered, let alone determined by it. The circumstances of society, of relationship, and of history are only accidents for the soul, perhaps misadventures: in any case, the world is not their work. By means of the idea of soul the individual is made transcendental; thanks to it, a ridiculous amount of importance can be attributed to him.

As a matter of fact, it was Christianity which first induced the individual to take up this position of judge of all things. It made megalomania almost his duty: it has made everything temporary and limited subordinate to eternal rights! What is the State, what is society, what are historical laws, what is physiology to me? Thus speaks something from beyond Becoming, an immutable entity throughout history: thus speaks something immortal, something divine--it is the soul!

Another Christian, but no less insane, concept has percolated even deeper into the tissues of modern ideas: the concept of the equality of all souls before God. In this concept the prototype of all theories concerning equal rights is to be found. Man was first taught to stammer this proposition religiously: later, it was converted into a moral; no wonder he has ultimately begun to take it

seriously, to take it _practically_!--that is to say, politically, socialistically, resento-pessimistically.

Wherever responsible circumstances or people have been looked for, it was the _instinct of revenge_ that sought them. This instinct of revenge obtained such an ascendancy over man in the course of centuries that the whole of metaphysics, psychology, ideas of society, and, above all, morality, are tainted with it. Man has nourished this idea of responsibility to such an extent that he has introduced the bacillus of vengeance into everything. By means of it he has made God Himself ill, and killed innocence in the universe, by tracing every condition of things to acts of will, to intentions, to responsible agents. The whole teaching of will, this most fatal fraud that has ever existed in psychology hitherto, was invented essentially for the purpose of punishment. It was the social utility of punishment that lent this concept its dignity, its power, and its truth. The originator of that psychology, that we shall call volitional psychology, must be sought in those classes which had the right of punishment in their hands; above all, therefore, among the priests who stood on the very pinnacle of ancient social systems: these people wanted to create for themselves the right to wreak revenge--they wanted to supply God with the privilege of vengeance. For this purpose; man was declared "free": to this end every action had to be regarded as voluntary, and the origin of every deed had to be considered as lying in consciousness. But by such propositions as these ancient psychology is refuted.

To-day, when Europe seems to have taken the contrary direction; when we halcyonians would fain withdraw, dissipate, and banish the concept of guilt and punishment with all our might from the world; when our most serious endeavours are concentrated upon purifying psychology, morality, history, nature, social institutions and privileges, and even God Himself, from this filth; in whom must we recognise our most mortal enemies? Precisely in those apostles of revenge and resentment, in those who are _par excellence_ pessimists from indignation, who make it their mission to sanctify their filth with the name of "righteous indignation."... We others, whose one desire is to reclaim innocence on behalf of Becoming, would fain be the missionaries of a purer thought, namely, that no one is responsible for man's qualities; neither God, nor society, nor his parents, nor his ancestors, nor himself--in fact, that no one is to blame for him ... The being who might be made responsible for a man's existence, for the fact that he is constituted in a particular way, or for his birth in certain circumstances and in a certain environment, is absolutely lacking.--_And it is a great blessing that such a being is non-existent ..._. We are _not_ the result of an eternal design, of a will, of a desire: there is no attempt being made with us to attain to an "ideal of perfection," to an "ideal of happiness," to an "ideal of virtue,"--and we are just as little the result of a mistake on God's part in the presence of which He ought to feel uneasy (a thought which is known to be at the very root of the Old Testament). There is not a place nor a purpose nor a sense to which we can attribute our existence or our kind of existence. In the first place, no one is in a position to do this: it is quite impossible to judge, to measure, or to compare, or even to deny the whole universe! And why?--For five reasons, all accessible to the man of average intelligence: for instance, _because there is no existence outside the universe ..._ and let us say it again, this is a great blessing, for therein lies the whole innocence of our lives.

2. The Individual.

766.

Fundamental errors: to regard the _herd_ as an aim instead of the individual! The herd is only a means and nothing _more_! But nowadays people are trying to understand _the herd_ as they would an individual, and to confer higher rights upon it than upon isolated personalities. Terrible mistake!! In addition to this, all that makes for gregariousness, _e.g._ sympathy, is regarded as the _more valuable_ side of our natures.

767.

The individual is something quite _new,_ and capable of _creating new things._ He is something absolute, and all his actions are quite his own. The individual in the end has to seek the valuation for his actions in himself: because he has to give an individual meaning even to traditional words and notions. His interpretation of a formula is at least personal, even if he does not create the formula itself: at least as an interpreter he is creative.

768.

The "ego" oppresses and kills. It acts like an organic cell. It is predatory and violent. It would fain regenerate itself--pregnancy. It would fain give birth to its God and see all mankind at its feet.

769.

Every living organism gropes around as far as its power permits, and overcomes all that is weaker than itself: by this means it finds pleasure in its own existence. The _increasing "humanity"_ of this tendency consists in the fact that we are beginning to feel ever more subtly how difficult it is really to _absorb_ others: while we could show our power by injuring him, his will _estranges_ him from us, and thus makes him less susceptible of being overcome.

770.

The degree of resistance which has to be continually overcome in order to remain _at the top,_ is the measure of _freedom,_ whether for individuals or for societies: freedom being understood as positive power, as will to power. The highest form of individual freedom, of sovereignty, would, according to this, in all probability be found not five feet away from its opposite--that is to say, where the danger of slavery hangs over life, like a hundred swords of Damocles. Let any one go through the whole of history from this point of view: the ages when the individual reaches perfect maturity, _i.e._ the free ages, when the classical type, _sovereign man,_ is attained to--these were certainly not humane times!

There should be no choice: either one must be uppermost or nethermost--like a worm, despised, annihilated, trodden upon. One must have tyrants against one in order to become a tyrant, _i.e._ in order to be free. It is no small advantage to have a hundred swords of Damocles suspended over one: it is only thus that one learns to dance, it is only thus that one attains to any freedom in one's movements.

771.

Man more than any other animal was originally _altruistic_--hence his slow growth (child) and lofty development. Hence, too, his extraordinary and latest kind of egoism.--Beasts of prey are much more _individualistic._

772.

A criticism of _selfishness._ The involuntary ingenuousness of La Rochefoucauld, who believed that he was saying something bold, liberal, and paradoxical (in his days, of course, truth in psychological matters was something that astonished people) when he said. "_Les grandes âmes ne sont pas celles qui ont moins de passions et plus de vertus que les âmes communes, mais seulement celles qui ont de plus grands desseins._" Certainly, John Stuart Mill (who calls Chamfort the _noble_ and philosophical La Rochefoucauld of the eighteenth century) recognises in him merely an astute and keen-sighted observer of all that which is the result of habitual selfishness in the human breast, and he adds: "A noble spirit is unable to see the necessity of a constant observation of _baseness_ and _contemptibility_, unless it were to show against what corrupting influences a lofty spirit and a noble character were able to triumph."

773.

The Morphology of the Feelings of Self.

First standpoint--To what extent are _sympathy_ or _communal feelings,_ the lower or preparatory states, at a time when personal self-esteem and initiative in valuation, on the part of individuals, are not yet possible?

Second standpoint.--To what extent is the zenith of collective self-esteem, the pride in the distinction of the clan, the feeling of inequality and a certain abhorrence of mediation, of equal rights and of reconciliation, the school for individual self-esteem? It may be this in so far as it compels the individual to represent the pride of the community --he is obliged to speak and act with tremendous self-respect, because he stands for the community And the same holds good when the individual regards himself as the instrument or speaking-tube of a godhead.

Third standpoint.--To what extent do these forms of impersonality invest the individual with enormous importance? In so far as higher powers are using him as an intermediary: religious shyness towards one's self is the condition of prophets and poets.

Fourth standpoint.--To what extent does responsibility for a whole educate the individual in foresight, and give him a severe and terrible hand, a calculating and cold heart, majesty of bearing and of action--things which he would not allow himself if he stood only for his own rights?

In short, collective self-esteem is the great preparatory school for personal sovereignty. The noble caste is that which creates the heritage of this faculty.

774.

The disguised forms of will to power:--

(1) _The desire for freedom,_ for independence for equilibrium, for peace, for _co-ordination._ Also that of the anchorite, the "Free-Spirit." In its lowest form, the will to live at all costs--the instinct of self-preservation.

(2) Subordination, with the view of satisfying the will to power of a whole community; submissiveness, the making of one's self indispensable and useful to him who has the power; love, a secret path to the heart of the powerful, in order to become his master.

(3) The feeling of duty, conscience, the imaginary comfort of belonging to a higher order than those who actually hold the reins of power; the acknowledgment of an order of rank which allows of judging even the more powerful, self-depreciation; the discovery of new _codes of morality_ (of which the Jews are a classical example).

775.

_Praise and gratitude as forms of will to power.--_Praise and gratitude for harvests, for good weather, victories, marriages, and peace--all festivals need a subject on which feeling can be outpoured. The desire is to make all good things that happen to one appear as though they had been done to one: people will have a donor. The same holds good of the work of art: people are not satisfied with it alone, they must praise the artist.--What, then, is praise? It is a sort of compensation for benefits received, a sort of giving back, a manifestation of _our_ power--for the man who praises assents to, blesses, values, _judges_. he arrogates to himself the right to give his consent to a thing, to be able to confer honours. An increased feeling of happiness or of liveliness is also an increased feeling of power, and it is as a result of this feeling that a man _praises_ (it is as the outcome of this feeling that he invents a donor, a "subject"). Gratitude is thus revenge of a lofty kind: it is most severely exercised and demanded where equality and pride both require to be upheld--that is to say, where revenge is practised to its fullest extent.

776.

Concerning the Machiavellism of Power.

The _will to power_ appears:--

_(a)_ Among the oppressed and slaves of all kinds, in the form of will to "_freedom_": the mere fact of breaking loose from something seems to be an end in itself (in a religio-moral sense: "One is only answerable to one's own conscience"; "evangelical freedom," etc. etc.),

_(b)_ In the case of a stronger species, ascending to power, in the form of the will to overpower. If this fails, then it shrinks to the "will to justice"--that is to say, to the will to the same measure of rights as the ruling caste possesses.

_(c)_ In the case of the strongest, richest, most independent, and most courageous, in the form of "love of humanity," of "love of the people," of the "gospel," of "truth" of "God," of "pity," of self sacrifice," etc. etc.; in the form of overpowering, of deeds of capture, of imposing service on some one, of an instinctive reckoning of one's self as part of a great mass of power to which one attempts to give a direction: the hero, the prophet, the Cæsar, the Saviour, the bell-wether. (The love of the sexes also belongs to this category, it will overpower something, possess it utterly, and it looks like self-abnegation. At bottom it is only the love of one's instrument, of one's "horse"--the conviction that things belong to one because one is in a position to use them.)

"Freedom," "Justice," "Love"!!!

777.

Love.--Behold this love and pity of women--what could be more egoistic? ... And when they do sacrifice themselves and their honour or reputation, to whom do they sacrifice themselves? To the man? Is it not rather to an unbridled desire? These desires are quite as selfish, even though they may be beneficial to others and provoke gratitude. ... To what extent can such a hyperfœtation of one valuation sanctify everything else!!

778.

"Senses," "Passions.".--When the fear of the senses and of the passions and of the desires becomes so great as to warn us against them, it is already a symptom of _weakness:_ extreme measures always characterise abnormal conditions. That which is lacking here, or more precisely that which is decaying, is the power to resist an impulse: when one feels instinctively that one must yield,--that is to say, that one must react,--then it is an excellent thing to avoid opportunities (temptations).

The stimulation of the senses is only a temptation in so far as those creatures are concerned whose systems are easily swayed and influenced: on the other hand, in the case of remarkable constitutional obtuseness and hardness, strong stimuli are necessary in order to set the functions in motion. Dissipation can only be objected to in the case of one who has no right to it; and almost all passions have fallen into disrepute thanks to those who were not strong enough to convert them to their own advantage.

One should understand that passions are open to the same objections as illnesses: yet we should not be justified in doing without illnesses, and still less without passions. We require the abnormal; we give life a tremendous shock by means of these great illnesses.

In detail the following should be distinguished:--

(1) The _dominating passion,_ which may even bring the supremest form of health with it: in this case the co-ordination of the internal system and its functions to perform one task is best attained,--but this is almost a definition of health.

(2) The antagonism of the passions the double, treble, and multiple soul in one breast:[6] this is very unhealthy; it is a sign of inner ruin and of disintegration, betraying and promoting an internal dualism and anarchy--unless, of course, one passion becomes master. _Return to health._

(3) The juxtaposition of passions without their being either opposed or united with one another. Very often transitory, and then, as soon as order is established, this condition may be a healthy one. A most interesting class of men belong to this order, the chameleons; they are not necessarily at loggerheads with themselves, they are both happy and secure, but they cannot develop--their moods lie side by side, even though they may seem to lie far apart. They change, but they become nothing.

[Footnote 6: This refers to Goethe's _Faust._ In Part I., Act I., Scene 11., we find Faust exclaiming in despair: "Two souls, alas! within my bosom throne!" See Theodore Martin's _Faust,_ translated into English verse.--Tr.]

779.

The quantitative estimate of aims and its influence upon the valuing standpoint, the _great_ and the _small_ criminal. The greatness or smallness of the aims will determine whether the doer feels respect for himself with it all, or whether he feels pusillanimous and miserable.

The degree of intellectuality manifested in the means employed may likewise influence our valuation. How differently the philosophical innovator, experimenter, and man of violence stands out against robbers, barbarians, adventurers!--There is a semblance of disinterestedness in the former.

Finally, noble manners, bearing, courage, self-confidence,--how they alter the value of that which is attained by means of them!

***

Concerning the optics of valuation:--

The influence of the greatness or smallness of the aims.

The influence of the intellectuality of the means. The influence of the behaviour in action. The influence of success or failure. The influence of opposing forces and their value. The influence of that which is permitted and that which is forbidden.

780.

The tricks by means of which actions, measures, and passions are legitimised, which from an individual standpoint are no longer good form or even in good taste.--

Art, which allows us to enter such strange worlds, makes them tasteful to us.

Historians prove its justification and reason; travels, exoticism, psychology, penal codes, the lunatic asylum, the criminal, sociology.

Impersonality (so that as media of a collective whole we allow ourselves these passions and action--the Bar, juries, the bourgeois, the soldier, the minister, the prince, society, "critics") makes us feel that we are _sacrificing something._

781.

Preoccupations concerning one's self and one's eternal salvation are not expressive either of a rich or of a self-confident nature, for the latter lets all questions of eternal bliss go to the devil,--it is not interested in such matters of happiness it is all power, deeds, desires; it imposes itself upon things; it even violates things. The Christian is a romantic hypochondriac who does not stand firmly on his legs.

Whenever hedonistic views come to the front, one can always presuppose the existence of pain and a certain ill-constitutedness.

782.

"The growing autonomy of the individual"--Parisian philosophers like M. Fouillée talk of such things: they would do well to study the _race moutonnière_ for a moment; for they belong to it. For Heaven's sake open your eyes, ye sociologists who deal with the future! The individual grew strong under quite opposite conditions: ye describe the extremest weakening and impoverishment of man; ye actually want this weakness and impoverishment, and ye apply the whole lying machinery of the old ideal in order to achieve your end. Ye are so constituted that ye actually regard your gregarious wants as an ideal! Here we are in the presence of an absolute lack of psychological honesty.

783.

The two traits which characterise the modern European are apparently antagonistic _individualism and the demand for equal rights_: this I am at last beginning to understand. The individual is an extremely vulnerable piece of vanity: this vanity, when it is conscious of its high degree of susceptibility to pain, demands that every one should be made equal; that the individual should only stand _inter pares_. But in this way a social race is depicted in which, as a matter of fact, gifts and powers are on the whole equally distributed. The pride which would have loneliness and but few appreciators is quite beyond comprehension: really "great" successes are only attained through the masses--indeed, we scarcely understand yet that a mob success is in reality only a small success; because _pulchrum est paucorum hominum._

No morality will countenance order of rank among men, and the jurists know nothing of a communal conscience. The principle of individualism rejects _really great_ men, and demands the most delicate vision for, and the speediest discovery of, a talent among people who are almost equal; and inasmuch as every one has some modicum of talent in such late and civilised cultures (and can, therefore, expect to receive his share of honour), there is a more general buttering-up of modest merits to-day than there has ever been. This gives the age the appearance of _unlimited justice._ Its want of justice is to be found not in its unbounded hatred of tyrants and demagogues, even in the arts; but in its detestation of noble natures who scorn the praise of the many. The demand for equal rights (that is to say, the privilege of sitting in judgment on everything and everybody) is anti-aristocratic.

This age knows just as little concerning the absorption of the individual, of his mergence into a great type of men who do not want to be personalities. It was this that formerly constituted the distinction and the zeal of many lofty natures (the greatest poets among them); or of the desire to be a _polis,_ as in Greece; or of Jesuitism, or of the Prussian Staff Corps, and bureaucracy; or of apprenticeship and a continuation of the tradition of great masters: to all of which things, non-social conditions and the absence of _petty vanity_ are necessary.

784.

Individualism is a modest and still unconscious form of will to power; with it a single human unit seems to think it sufficient to free himself from the preponderating power of society (or of the State or Church). He does not set himself up in opposition as a _personality,_ but merely as a unit; he represents the rights of all other individuals as against the whole. That is to say, he instinctively places himself on a level with every other unit: what he combats he does not combat as a person, but as a representative of units against a mass.

Socialism is merely an agitatory measure of individualism: it recognises the fact that in order to attain to something, men must organise themselves into a general movement--into a "power." But what the Socialist requires is not society as the object of the individual, _but society as a means of making many individuals possible_: this is the instinct of Socialists, though they frequently deceive themselves on this point (apart from this, however, in order to make their kind prevail, they are compelled to deceive others to an enormous extent). Altruistic moral preaching thus enters into the service of individual egoism,--one of the most common frauds of the nineteenth century.

Anarchy is also merely an agitatory measure of Socialism; with it the Socialist inspires fear, with fear he begins to fascinate and to terrorise: but what he does above all is to draw all courageous and reckless people to his side, even in the most intellectual spheres.

In spite of all this, individualism is the most modest stage of the will to power.

***

When one has reached a certain degree of independence, one always longs for more: separation in proportion to the degree of force; the individual is no longer content to regard himself as equal to everybody, he actually _seeks for his peer_--he makes himself stand out from others. Individualism is followed by a development in groups and organs; correlative tendencies join up together and become powerfully active: now there arise between these centres of power, friction, war, a reconnoitring of the forces on either side, reciprocity, understandings, and the regulation of mutual services. Finally, there appears an order of rank.

Recapitulation--

1. The individuals emancipate themselves.

2. They make war, and ultimately agree concerning equal rights (justice is made an end in itself).

3. Once this is reached, the actual differences in degrees of power begin to make themselves felt, and to a greater extent than before (the reason being that on the whole peace is established, and innumerable small centres of power begin to create differences which formerly were scarcely noticeable). Now the individuals begin to form groups, these strive after privileges and preponderance, and war starts afresh in a milder form.

People demand freedom only when they have no power. Once power is obtained, a preponderance thereof is the next thing to be coveted; if this is not achieved (owing to the fact that one is still too weak for it), then _"justice" i.e. "equality_ of power" become the objects of desire.

785.

The rectification of the concept "egoism."--When one has discovered what an error the "individual" is, and that every single creature represents the whole process of evolution (not alone "inherited," but in "himself"), the individual then acquires _an inordinately great importance._ The voice of instinct is quite right here. When this instinct tends to decline, _i.e._ when the individual begins to seek his worth in his services to others, one may be sure that exhaustion and degeneration have set in. An altruistic attitude of mind, when it is fundamental and free from all hypocrisy, is the instinct of creating a second value for one's self in the service of other egoists. As a rule, however, it is only apparent--a circuitous path to the preservation of one's own feelings of vitality and worth.

786.

The History of Moralisation and Demoralisation.

Proposition one.--There are no such things as moral actions: they are purely imaginary. Not only is it impossible to demonstrate their existence (a fact which Kant and Christianity, for instance, both acknowledged) but they are not even possible. Owing to psychological misunderstanding, a man invented an _opposite_ to the instinctive impulses of life, and believed that a new species of instinct was thereby discovered: a _primum mobile_ was postulated which does not exist at all. According to the valuation which gave rise to the antithesis "moral" and "immoral," one should say: _There is nothing else on earth but immoral intentions and actions._

Proposition two.----The whole differentiation, "moral" and "immoral," arises from the assumption that both moral and immoral actions are the result of a spontaneous will--in short, that such a will exists; or in other words, that moral judgments can only hold good with regard to intuitions and actions _that are free._ But this whole order of actions and intentions is purely imaginary: the only world to which the moral standard could be applied does not exist at all: _there is no such thing as a moral or an immoral action._

The _psychological error_ out of which the antithesis "moral" and "immoral" arose is: "selfless," "unselfish," "self-denying"--all unreal and fantastic.

A false dogmatism also clustered around the concept "ego"; it was regarded as atomic, and falsely opposed to a non-ego; it was also liberated from Becoming, and declared to belong to the sphere of Being. The false materialisation of the ego: this (owing to the belief in individual immortality) was made an article of faith under the pressure of _religio-moral discipline._ According to this artificial liberation of the ego and its transference to the realm of the absolute, people thought that they had arrived at an antithesis in values which seemed quite irrefutable--the single ego and the vast non-ego. It seemed obvious that the value of the individual ego could only exist in conjunction with the vast non-ego, more particularly in the sense of being subject to it and existing only for its sake. Here, of course, the gregarious instinct determined the direction of thought: nothing is more opposed to this instinct than the sovereignty of the individual. Supposing, however, that the ego be absolute, then its value must lie in _self-negation._

Thus: (1) the false emancipation of the "individual" as an atom;

(2) The gregarious self-conceit which abhors the desire to remain an atom, and regards it as hostile.

(3) As a result: the overcoming of the individual by changing his aim.

(4) At this point there appeared to be actions that were self-effacing: around these actions a whole sphere of antitheses was fancied.

(5) It was asked, in what sort of actions does man most strongly assert himself? Around these (sexuality, covetousness, lust for power, cruelty, etc. etc.) hate, contempt, and anathemas were heaped: it was believed that there could be such things as selfless impulses. Everything selfish was condemned, everything unselfish was in demand.

(6) And the result was: what had been done? A ban had been placed on the strongest, the most natural, yea, the only genuine impulses, henceforward, in order that an action might be praiseworthy, there must be no trace in it of any of those genuine impulses--_monstrous fraud in psychology._ Every kind of "self-satisfaction" had to be remodelled and made possible by means of misunderstanding and adjusting one's self _sub specie boni._ Conversely: that species which found its advantage in depriving mankind of its self-satisfaction, the representatives of the gregarious instincts, _e.g._ the priests and the philosophers, were sufficiently crafty and psychologically astute to show how selfishness ruled everywhere. The Christian conclusion from this was: "Everything is sin, even our virtues. Man is utterly undesirable. Selfless actions are impossible." Original sin. In short, once man had opposed his instincts to a purely imaginary world of the good, he concluded by despising himself as incapable of performing "good" actions.

_N.B._ In this way Christianity represents a step forward in the sharpening of psychological insight: La Rochefoucauld and Pascal. It perceived the essential equality of human actions, and the equality of their values as a whole (all immoral).

***

Now the first serious object was to rear men in whom self-seeking impulses were extinguished. _priests, saints._ And if people doubted that perfection was possible, they did not doubt what perfection was.

The psychology of the saint and of the priest and of the "good" man, must naturally have seemed purely phantasmagorical. The real motive of all action had been declared bad: therefore, in order to make action still possible, deeds had to be prescribed which, though not possible, had to be declared possible and sanctified. They now honoured and idealised things with as much falsity as they had previously slandered them.

Inveighing against the instincts of life came to be regarded as holy and estimable. The priestly ideal was: absolute chastity, absolute obedience, absolute poverty! The lay ideal: alms, pity, self-sacrifice, renunciation of the beautiful, of reason, and of sensuality, and a dark frown for all the strong qualities that existed.

***

An advance is made: the slandered instincts attempt to re-establish their rights (_e.g._ Luther's Reformation, the coarsest form of moral falsehood under the cover of "Evangelical freedom"), they are rechristened with holy names.

The calumniated instincts try to demonstrate that they are necessary in order that the virtuous instincts may be possible. _Il faut vivre, afin de vivre pour autrui:_ egoism as a means to an end.[7]

But people go still further: they try to grant both the egoistic and altruistic impulses the right to exist--equal rights for both--from the utilitarian standpoint.

People go further: they see greater utility in placing the egoistic rights before the altruistic--greater utility in the sense of more happiness for the majority, or of the elevation of mankind, etc. etc. Thus the rights of egoism begin to preponderate, but under the cloak of an extremely altruistic standpoint--the collective utility of humanity.

An attempt is made to reconcile the altruistic mode of action with the natural order of things. Altruism is sought in the very roots of life. Altruism and egoism are both based upon the essence of life and nature.

The disappearance of the opposition between them is dreamt of as a future possibility. Continued adaptation, it is hoped, will merge the two into one.

At last it is seen that altruistic actions are merely a species of the egoistic--and that the degree to which one loves and spends one's self is a proof of the extent of one's individual power and personality. In short, that the more evil man can be made, the better he is, and that one cannot be the one without the other. At this point the curtain rises which concealed the monstrous fraud of the psychology that has prevailed hitherto.

***

Results.--There are only immoral intentions and actions; the so-called moral actions must be shown to be immoral. All emotions are traced to a single will, the will to power, and are called essentially equal. The concept of life: in the apparent antithesis good and evil, degrees of power in the instincts alone are expressed. A temporary order of rank is established according to which certain instincts are either controlled or enlisted in our service. Morality is justified: economically, etc.

***

Against proposition two.--Determinism: the attempt to rescue the moral world by transferring it to the unknown.

Determinism is only a manner of allowing ourselves to conjure our valuations away, once they have lost their place in a world interpreted mechanistically. Determinism must therefore be attacked and undermined at all costs: just as our right to distinguish between an absolute and phenomenal world should be disputed.

[Footnote 7: Spencer's conclusion in the _Data of Ethics._--Tr.]

787.

It is absolutely necessary to emancipate ourselves from motives: otherwise we should not be allowed to attempt to sacrifice ourselves or to neglect ourselves! Only the innocence of Becoming gives us the highest courage and the highest freedom.

788.

A clean conscience must be restored to the evil man--has this been my involuntary endeavour all the time? for I take as the evil man him who is strong (Dostoievsky's belief concerning the convicts in prison should be referred to here).

789.

Our new "freedom." What a feeling of relief there is in the thought that we emancipated spirits do not feel ourselves harnessed to any system of teleological aims. Likewise that the concepts reward and punishment have no roots in the essence of existence! Likewise that good and evil actions are not good or evil in themselves, but only from the point of view of the self-preservative tendencies of certain species of humanity! Likewise that our speculations concerning pleasure and pain are not of cosmic, far less then of metaphysical, importance! (That form of pessimism associated with the name of Hartmann, which pledges itself to put even

the pain and pleasure of existence into the balance, with its arbitrary confinement in the prison and within the bounds of pre-Copernican thought, would be something not only retrogressive, but degenerate, unless it be merely a bad joke on the part of a "Berliner."[8])

[Footnote 8: "Berliner"--The citizens of Berlin are renowned in Germany for their poor jokes.--Tr.]

790.

If one is clear as to the "wherefore" of one's life, then the "how" of it can take care of itself.

It is already even a sign of disbelief in the wherefore and in the purpose and sense of life--in fact, it is a sign of a lack of will--when the value of pleasure and pain step into the foreground, and hedonistic and pessimistic teaching becomes prevalent; and self-abnegation, resignation, virtue, "objectivity," _may,_ at the very least, be signs that the most important factor is beginning to make its absence felt.

791.

Hitherto there has been no German culture. It is no refutation of this assertion to say that there have been great anchorites in Germany (Goethe, for instance); for these had their own culture. But it was precisely around them, as though around mighty, defiant, and isolated rocks, that the remaining spirit of Germany, _as their antithesis,_ lay that is to say, as a soft, swampy, slippery soil, upon which every step and every footprint of the rest of Europe made an impression and created forms. German culture was a thing devoid of character and of almost unlimited yielding power.

792.

Germany, though very rich in clever and well-informed scholars, has for some time been so excessively poor in great souls and in mighty minds, that it almost seems to have forgotten what a great soul or a mighty mind is; and to-day mediocre and even ill-constituted men place themselves in the market square without the suggestion of a conscience-prick or a sign of embarrassment, and declare themselves great men, reformers, etc. Take the case of Eugen Dühring, for instance, a really clever and well-informed scholar, but a man who betrays with almost every word he says that he has a miserably small soul, and that he is horribly tormented by narrow envious feelings; moreover, that it is no mighty overflowing, benevolent, and spendthrift spirit that drives him on, but only the spirit of ambition! But to be ambitious in such an age as this is much more unworthy of a philosopher than ever it was: to-day, when it is the mob that rules, when it is the mob that dispenses the honours.

793.

My "future": a severe polytechnic education. Conscription; so that as a rule every man of the higher classes should be an officer, whatever else he may be besides.

IV.

THE WILL TO POWER IN ART.

794.

Our religion, morality, and philosophy are decadent human institutions. The counter-agent. Art.

795.

The _Artist-philosopher._ A higher concept of art. Can man stand at so great a distance from his fellows as to mould them? (Preliminary exercises thereto:--

1. To become a self-former, an anchorite.

2. To do what artists have done hitherto, _i.e._ to reach a small degree of perfection in a certain medium.)

796.

Art as it appears without the artist, _i.e._ as a body, an organisation (the Prussian Officers' Corps, the Order of the Jesuits). To what extent is the artist merely a preliminary stage? The world regarded as a self-generating work of art.

797.

The phenomenon, "artist," is the easiest to see through: from it one can look down upon the fundamental instincts of power, of nature, etc., even of religion and morality.

"Play," uselessness--as the ideal of him who is overflowing with power, as the ideal of the child. The childishness of God, παῖς παίζων.

798.

Apollonian, Dionysian. There are two conditions in which art manifests itself in man even as a force of nature, and disposes of him whether he consent or not: it may be as a constraint to visionary states, or it may be an orgiastic impulse. Both conditions are to be seen in normal life, but they are then somewhat weaker: in dreams and in moments of elation or intoxication.[9]

But the same contrast exists between the dream state and the state of intoxication; both of these states let loose all manner of artistic powers within us, but each unfetters powers of a different kind. Dreamland gives us the power of vision, of association, of poetry: intoxication gives us the power of grand attitudes, of passion, of song, and of dance.

[Footnote 9: German: "Rausch."--There is no word in English for the German expression "Rausch." When Nietzsche uses it, he means a sort of blend of our two words: intoxication and elation.--Tr.]

799.

Sexuality and voluptuousness belong to the Dionysiac intoxication: but neither of them is lacking in the Apollonian state. There is also a difference of tempo between the states.... _The extreme peace of certain feelings of intoxication_ (or, more strictly, the slackening of the feeling of time, and the reduction of the feeling of space) is wont to reflect itself in the vision of the most restful attitudes and states of the soul. The classical style essentially represents repose, simplification, foreshortening, and concentration--the _highest feeling of power_ is concentrated in the classical type. To react with difficulty: great consciousness: no feeling of strife.

800.

The feeling of intoxication is, as a matter of fact, equivalent to a sensation of _surplus power_: it is strongest in seasons of rut: new organs, new accomplishments, new colours, new forms. Embellishment is an outcome of _increased power._ Embellishment is merely an expression of a triumphant will, of an increased state of co-ordination, of a harmony of all the strong desires, of an infallible and perpendicular equilibrium. Logical and geometrical simplification is the result of an increase of power: conversely, the mere aspect of such a simplification increases the sense of power in the beholder.... The zenith of development: the grand style.

Ugliness signifies _the decadence of a type_: contradiction and faulty co-ordination among the inmost desires--this means a decline in the _organising_ power, or, psychologically speaking, in the will. The condition of pleasure which is called intoxication is really an exalted feeling of power. ... Sensations of space and time are altered; inordinate distances are traversed by the eye, and only then become visible; the extension of the vision over greater masses and expanses; the refinement of the organ which apprehends the smallest and most elusive things; divination, the power of understanding at the slightest hint, at the smallest suggestion; intelligent sensitiveness; _strength_ as a feeling of dominion in the muscles, as agility and love of movement, as dance, as levity and quick time; strength as the love of proving strength, as bravado, adventurousness, fearlessness, indifference in regard to life and death.... All these elated moments of life stimulate each other; the world of images and of imagination of the one suffices as a suggestion for the other: in this way states finally merge into each other, which might do better to keep apart, _e.g._ the feeling of religious intoxication and sexual irritability (two very profound feelings, always wonderfully co-ordinated. What is it that pleases almost all pious women, old or young? Answer: a saint with beautiful legs, still young, still innocent). Cruelty in tragedy and pity (likewise normally correlated). Spring-time, dancing, music, --all these things are but the display of one sex before the other,--as also that "infinite yearning of the heart" peculiar to Faust.

Artists when they are worth anything at all are men of strong propensities (even physically), with surplus energy, powerful animals, sensual; without a certain overheating of the sexual system a man like Raphael is unthinkable.... To produce music is also in a sense to produce children; chastity is merely the economy of the artist, and in all creative artists productiveness certainly ceases with sexual potency.... Artists should not see things as they are; they should see them fuller, simpler, stronger: to this end, however, a kind of youthfulness, of vernality, a sort of perpetual elation, must be peculiar to their lives.

801.

The states in which we transfigure things and make them fuller, and rhapsodise about them, until they reflect our own fulness and love of life back upon us: sexuality, intoxication, post-prandial states, spring, triumph over our enemies, scorn, bravado, cruelty, the ecstasy of religious feeling. But three elements above all are active: _sexuality, intoxication, cruelty_; all these belong to the oldest _festal joys_ of mankind, they also preponderate in budding artists.

Conversely: there are things with which we meet which already show us this transfiguration and fulness, and the animal world's response thereto is a state of excitement in the spheres where these states of happiness originate. A blending of these very delicate shades of animal well-being and desires is the _æsthetic state._ The latter only manifests itself in those natures which are capable of that spendthrift and overflowing fulness of bodily vigour; the latter is always the _primum mobile._ The sober-minded man, the tired man, the exhausted and dried-up man (_e.g._ the scholar), can have no feeling for art, because he does not possess the primitive force of art, which is the tyranny of inner riches: he who cannot give anything away cannot feel anything either.

"Perfection"--In these states (more particularly in the case of sexual love) there is an ingenuous betrayal of what the profoundest instinct regards as the highest, the most desirable, the most valuable, the ascending movement of its type; also of the condition towards which it is actually striving. Perfection: the extraordinary expansion of this instinct's feeling of power, its riches, its necessary overflowing of all banks.

802.

Art reminds us of states of physical vigour: it may be the overflow and bursting forth of blooming life in the world of pictures and desires; on the other hand, it may be an excitation of the physical functions by means of pictures and desires of exalted life--an enhancement of the feeling of life, the latter's stimulant.

To what extent can ugliness exercise this power? In so far as it may communicate something of the triumphant energy of the artist who has become master of the ugly and the repulsive; or in so far as it gently excites our lust of cruelty (in some circumstances even the lust of doing harm to ourselves, self-violence, and therewith the feeling of power over ourselves).

803.

"Beauty" therefore is, to the artist, something which is above all order of rank, because in beauty contrasts are overcome, the highest sign of power thus manifesting itself in the conquest of opposites; and achieved without a feeling of tension: violence being no longer necessary, everything submitting and obeying so easily, and doing so with good grace; this is what delights the powerful will of the artist.

804.

The biological value of _beauty_ and _ugliness._ That which we feel instinctively opposed to us æsthetically is, according to the longest experience of mankind, felt to be harmful, dangerous, and worthy of suspicion: the sudden utterance of the æsthetic instinct, _e.g._ in the case of loathing, implies an act of judgment. To this extent beauty lies within the general category of the biological values, useful, beneficent, and life-promoting: thus, a host of stimuli which for ages have been associated with, and remind us of, useful things and conditions, give us the feeling of beauty, _i.e._ the increase of the feeling of power (not only things, therefore, but the sensations which are associated with such things or their symbols). In this way beauty and ugliness are recognised as determined by our most fundamental self-preservative values. Apart from this, it is nonsense to postulate anything as beautiful or ugly. Absolute beauty exists just as little as absolute goodness and truth. In a particular case it is a matter of the self-preservative conditions of a certain type of man: thus the gregarious man will have quite a different feeling for beauty from the exceptional or super-man.

It is the optics of things in the foreground which only consider immediate consequences, from which the value beauty (also goodness and truth) arises.

All instinctive judgments are short-sighted in regard to the concatenation of consequences: they merely advise what must be done forthwith. Reason is essentially an obstructing apparatus preventing the immediate response to instinctive judgments: it halts, it calculates, it traces the chain of consequences further.

Judgments concerning beauty and ugliness are short-sighted (reason is always opposed to them): but they are convincing in the highest degree; they appeal to our instincts in that quarter where the latter decide most quickly and say yes or no with least hesitation, even before reason can interpose.

The most common affirmations of beauty stimulate each other reciprocally; where the æsthetic impulse once begins to work, a whole host of other and foreign perfections crystallise around the "particular form of beauty." It is impossible to remain objective, it is certainly impossible to dispense with the interpreting, bestowing, transfiguring, and poetising power (the latter is a stringing together of affirmations concerning beauty itself). The sight of a beautiful woman....

Thus (1) judgment concerning beauty is short-sighted; it sees only the immediate consequences.

(2) It smothers the object which gives rise to it with a charm that is determined by the association of various judgments concerning beauty, which, however, are quite alien to the _essence of the particular object._ To regard a thing as beautiful is necessarily to regard it falsely (that is why incidentally love marriages are from the social point of view the most unreasonable form of matrimony).

805.

Concerning the genesis of Art. That making perfect and seeing perfect, which is peculiar to the cerebral system overladen with sexual energy (a lover alone with his sweetheart at eventide transfigures the smallest details: life is a chain of sublime things, "the misfortune of an unhappy love affair is more valuable than anything else"); on the other hand, everything perfect and beautiful operates like an unconscious recollection of that amorous condition and of the point of view peculiar to it--all perfection, and the whole of the beauty of things, through contiguity, revives aphrodisiac bliss. (Physiologically it is the creative instinct of the artist and the distribution of his semen in his blood.) The desire for art and beauty is an indirect longing for the ecstasy; of sexual desire, which gets communicated to the brain. The world become perfect through "love."

806.

Sensuality in its various disguises.--(1) As idealism (Plato), common to youth, constructing a kind of concave-mirror in which the image of the beloved is an incrustation, an exaggeration, a transfiguration, an attribution of infinity to everything. (2) In the religion of love, "a fine young man," "a beautiful woman," in some way divine; a bridegroom, a bride of the soul. (3) In art, as a decorating force, _e.g._ just as the man sees the woman and makes her a present of everything that can enhance her personal charm, so the sensuality of the artist adorns an object with everything else that he honours and esteems, and by this means perfects it (or idealises it). Woman, knowing what man feels in regard to her, tries to meet his idealising endeavours half-way by decorating herself, by walking and dancing well, by expressing delicate thoughts: in addition, she may practise modesty, shyness, reserve--prompted by her instinctive feeling that the idealising power of man increases with all this, (In the extraordinary finesse of woman's instincts, modesty must not by any means be considered as conscious hypocrisy: she guesses that it is precisely artlessness and real shame which seduces man most and urges him to an exaggerated esteem of her. On this account, woman is ingenuous, owing to the subtlety of her instincts which reveal to her the utility of a state of innocence. A wilful closing of one's eyes to one's self.... Wherever dissembling has a stronger influence by being unconscious it actually becomes unconscious.)

807.

What a host of things can be accomplished by the state of intoxication which is called by the name of love, and which is something else besides love!--And yet everybody has his own experience of this matter. The muscular strength of a girl suddenly increases as soon as a man comes into her presence: there are instruments with which this can be measured. In the case of a still closer relationship of the sexes, as, for instance, in dancing and in other amusements which society gatherings entail, this power increases to such an extent as to make real feats of strength possible: at last one no longer trusts either one's eyes, or one's watch! Here at all events we must reckon with the fact that dancing itself, like every form of rapid movement, involves a kind of intoxication of the whole nervous, muscular, and visceral system. We must therefore reckon in this case with the collective effects of a double

intoxication.--And how clever it is to be a little off your head at times! There are some realities which we cannot admit even to ourselves: especially when; we are women and have all sorts of feminine, _"pudeurs."..._Those young creatures dancing over there are obviously beyond all reality: they are dancing only with a host of tangible ideals: what is more, they even see ideals sitting around them, their mothers!... An opportunity for quoting _Faust._ They look incomparably fairer, do these pretty creatures, when they have lost their head a little; and how well they know it too, they are even more delightful _because_ they know it! Lastly, it is their finery which inspires them; their finery is their third little intoxication. They believe in their dressmaker as in their God: and who would destroy this faith in them? Blessed is this faith! And self-admiration is healthy! Self-admiration can protect one even from cold! Has a beautiful woman, who knew she was well-dressed, ever caught cold? Never yet on this earth! I even suppose a case in which she has scarcely a rag on her.

808.

If one should require the most astonishing proof of how far the power of transfiguring, which comes of intoxication, goes, this proof is at hand in the phenomenon of love; or what is called love in all the languages and silences of the world. Intoxication works to such a degree upon reality in this passion that in the consciousness of the lover the cause of his love is quite suppressed, and something else seems to take its place,--a vibration and a glitter of all the charm-mirrors of Circe.... In this respect to be man or an animal makes no difference: and still less does spirit, goodness, or honesty. If one is astute, one is befooled astutely; if one is thick-headed, one is befooled in a thick-headed way. But love, even the love of God, saintly love, "the love that saves the soul," are at bottom all one; they are nothing but a fever which has reasons to transfigure itself--a state of intoxication which does well to lie about itself.... And, at any rate, when a man loves, he is a good liar about himself and to himself: he seems to himself transfigured, stronger, richer, more perfect; he _is_ more perfect.... _Art_ here acts as an organic function: we find it present in the most angelic instinct "love"; we find it as the greatest stimulus of life--thus art is sublimely utilitarian, even in the fact that it lies.... But we should be wrong to halt at its power to lie: it does more than merely imagine; it actually transposes values. And it not only transposes the _feeling_ for values: the lover actually _has_ a greater value; he is stronger. In animals this condition gives rise to new weapons, colours, pigments, and forms, and above all to new movements, new rhythms, new love-calls and seductions. In man it is just the same. His whole economy is richer, mightier, and _more complete_ when he is in love than when he is not. The lover becomes a spendthrift; he is rich enough for it. He now dares; he becomes an adventurer, and even a donkey in magnanimity and innocence; his belief in God and in virtue revives, because he believes in love. Moreover, such idiots of happiness acquire wings and new capacities, and even the door to art is opened to them.

If we cancel the suggestion of this intestinal fever from the lyric of tones and words, what is left to poetry and music? ... _L'art pour l'art_ perhaps; the professional cant of frogs shivering outside in the cold, and dying of despair in their swamp.... Everything else was created by love.

809.

All art works like a suggestion on the muscles and the senses which were originally active in the ingenuous artistic man; its voice is only heard by artists--it speaks to this kind of man, whose constitution is attuned to such subtlety in sensitiveness. The concept "layman" is a misnomer. The deaf man is not a subdivision of the class, whose ears are sound. All art works as a _tonic;_ it increases strength, it kindles desire _(i.e._ the feeling of strength), it excites all the more subtle recollections of intoxication; there is actually a special kind of memory which underlies such states--a distant flitful world of sensations here returns to being.

Ugliness is the contradiction of art. It is that which art _excludes,_ the _negation_ of art: wherever decline, impoverishment of life, impotence, decomposition, dissolution, are felt, however remotely, the æsthetic man reacts with his _No._ Ugliness _depresses_: it is the sign of depression. It _robs_ strength, it impoverishes, it weighs down, ... Ugliness _suggests_ repulsive things. From one's states of health one can test how an indisposition may increase one's power of fancying ugly things. One's selection of things, interests, and questions becomes different. Logic provides a state which is next of kin to ugliness: heaviness, bluntness. In the presence of ugliness equilibrium is lacking in a mechanical sense: ugliness limps and stumbles--the direct opposite of the godly agility of the dancer.

The æsthetic state represents an overflow _of means of communication_ as well as a condition of extreme sensibility to stimuli and signs. It is the zenith of communion and transmission between living creatures; it is the source of languages. In it, languages, whether of signs, sounds, or glances, have their birthplace. The richer phenomenon is always the beginning: our abilities are subtilised forms of richer abilities. But even to-day we still listen with our muscles, we even read with our muscles.

Every mature art possesses a host of conventions as a basis: in so far as it is a language. Convention is a condition of great art, _not_ an obstacle to it.... Every elevation of life likewise elevates the power of communication, as also the understanding of man. _The power of living in other people's souls_ originally had nothing to do with morality, but with a physiological irritability of suggestion: "sympathy," or what is called "altruism," is merely a product of that psycho-motor relationship which is reckoned as spirituality (psycho-motor induction, says Charles Féré). People never communicate a thought to one another: they communicate a movement, an imitative sign which is then interpreted as a thought.

810.

Compared with music, communication by means of words is a shameless mode of procedure; words reduce and stultify; words make impersonal; words make common that which is uncommon.

811.

It is exceptional states that determine the artist--such states as are all intimately related and entwined with morbid symptoms, so that it would seem almost impossible to be an artist without being ill.

The physiological conditions which in the artist become moulded into a "personality," and which, to a certain degree, may attach themselves to any man:--

(1) Intoxication, the feeling of enhanced power; the inner compulsion to make things a mirror of one's own fulness and perfection.

(2) The extreme sharpness of certain senses, so that they are capable of understanding a totally different language of signs--and to create such a language (this is a condition which manifests itself in some nervous diseases); extreme susceptibility out of which great powers of communion are developed; the desire to speak on the part of everything that is capable of making-signs; a need of being rid of one's self by means of gestures and attitudes; the ability of speaking about one's self in a hundred different languages--in fact, a state of _explosion._

One must first imagine this condition as one in which there is a pressing and compulsory desire of ridding one's self of the ecstasy of a state of tension, by all kinds of muscular work and movement; also as an involuntary _co-ordination_ of these movements with inner processes (images, thoughts, desires)--as a kind of automatism of the whole muscular system under the compulsion of strong stimuli acting from within; the inability to resist reaction; the apparatus of resistance is also suspended. Every inner movement (feeling, thought, emotion) is accompanied by _vascular changes,_ and consequently by changes in colour, temperature, and secretion. The suggestive power of music, its "_suggestion mentale._"

(3) _The compulsion to imitate:_ extreme irritability, by means of which a certain example becomes contagious--a condition is guessed and represented merely by means of a few signs.... A complete picture is visualised by one's inner consciousness, and its effect soon shows itself in the movement of the limbs,--in a certain suspension of the _will_ (Schopenhauer!!!!). A sort of blindness and deafness towards the external world,--the realm of admitted stimuli is sharply defined.

This differentiates the artist from the layman (from the spectator of art): the latter reaches the height of his excitement in the mere act of apprehending: the former in giving--and in such a way that the antagonism between these two gifts is not only natural but even desirable. Each of these states has an opposite standpoint--to demand of the artist that he should have the point of view of the spectator (of the critic) is equivalent to asking him to impoverish his creative power.... In this respect the same difference holds good as that which exists between the sexes: one should not ask the artist who gives to become a woman--to _"receive."_

Our æsthetics have hitherto been women's æsthetics, inasmuch as they have only formulated the experiences of what is beautiful, from the point of view of the receivers in art. In the whole of philosophy hitherto the artist has been lacking ... _i.e._ as we have already suggested, a necessary fault: for the artist who would begin to understand himself would therewith begin to mistake himself--he must not look backwards, he must not look at all; he must give.--It is an honour for an artist to have no critical faculty; if he can criticise he is mediocre, he is modern.

812.

Here I lay down a series of psychological states as signs of flourishing and complete life, which to-day we are in the habit of regarding as morbid. But, by this time, we have broken ourselves of the habit of speaking of healthy and morbid as opposites: the

question is one of degree, what I maintain on this point is that what people call healthy nowadays represents a lower level of that which under favourable circumstances actually would be healthy--that we are relatively sick....

The artist belongs to a much stronger race. That which in us would be harmful and sickly, is natural in him. But people object to this that it is precisely the impoverishment of the machine which renders this extraordinary power of comprehending every kind of suggestion possible: _e.g._ our hysterical females.

An overflow of spunk and energy may quite as well lead to symptoms of partial constraint, sense hallucinations, peripheral sensitiveness, as a poor vitality does--the stimuli are differently determined, the effect is the same.... What is not the same is above all the ultimate result; the extreme torpidity of all morbid natures, after their nervous eccentricities, has nothing in common with the states of the artist, who need in no wise repent his best moments.... He is rich enough for it all: he can squander without becoming poor.

Just as we now feel justified in judging genius as a form of neurosis, we may perhaps think the same of artistic suggestive power,--and our artists are, as a matter of fact, only too closely related to hysterical females!!! This, however, is only an argument against the present day, and not against artists in general.

The inartistic states are: objectivity, reflection suspension of the will ... (Schopenhauer's scandalous misunderstanding consisted in regarding art as a mere bridge to the denial of life)... The inartistic states are: those which impoverish, which subtract, which bleach, under which life suffers--the Christian.

813.

The modern artist who, in his physiology, is next of kin to the hysteric, may also be classified as a character belonging to this state of morbidness. The hysteric is false,--he lies from the love of lying, he is admirable in all the arts of dissimulation,--unless his morbid vanity hood-wink him. This vanity is like a perpetual fever which is in need of stupefying drugs, and which recoils from no self-deception and no farce that promises it the most fleeting satisfaction. (The incapacity for pride and the need of continual revenge for his deep-rooted self-contempt, this is almost the definition of this man's vanity.)

The absurd irritability of his system, which makes a crisis out of every one of his experiences, and sees dramatic elements in the most insignificant occurrences of life, deprives him of all calm reflection; he ceases from being a personality, at most he is a rendezvous of personalities of which first one and then the other asserts itself with barefaced assurance. Precisely on this account he is great as an actor _i_ all these poor will-less people, whom doctors study so profoundly, astound one through their virtuosity in mimicking, in transfiguration, in their assumption of almost any character required.

814.

Artists are not men of great passion, despite all their assertions to the contrary both to themselves and to others. And for the following two reasons: they lack all shyness towards themselves (they watch themselves live, they spy upon themselves, they are much too inquisitive), and they also lack shyness in the presence of passion (as artists they exploit it). Secondly, however, that vampire, their talent, generally forbids them such an expenditure of energy as passion demands.--A man, who has a talent is sacrificed to that talent; he lives under the vampirism of his talent.

A man does not get rid of his passion by reproducing it, but rather he is rid of it if he is able to reproduce it. (Goethe teaches the reverse, but it seems as though he deliberately misunderstood himself here--from a sense of delicacy.)

815.

Concerning a reasonable mode of life.--.Relative, chastity, a fundamental and shrewd caution in regard to _erotica,_ even in thought, may be a reasonable mode of life even in richly equipped and perfect natures. But this principle applies more particularly to artists; it belongs to the best wisdom of their lives. Wholly trustworthy voices have already been raised in favour of this view, _e.g._ Stendhal, Th. Gautier, and Flaubert. The artist is perhaps in his way necessarily a sensual man, generally susceptible, accessible to everything, and capable of responding to the remotest stimulus or suggestion of a stimulus. Nevertheless, as a rule he is in the power of his work, of his will to mastership, really a sober and often even a chaste man. His dominating instinct will have him so: it does not allow him to spend himself haphazardly. It is one and the same form of strength which is spent in artistic conception and in the sexual act: there is only one form of strength. The artist who yields in this respect, and who spends himself, is

betrayed: by so doing he reveals his lack of instinct, his lack of will in general. It may be a sign of decadence,--in any case it reduces the value of his art to an incalculable degree.

816.

Compared with the artist, the scientific man, regarded as a phenomenon, is indeed a sign of a certain storing-up and levelling-down of life (but also of an increase of strength, severity, hardness, and will-power). To what extent can falsity and indifference towards truth and utility be a sign of youth, of childishness, in the artist? ... Their habitual manner, their unreasonableness, their ignorance of themselves, their indifference to "eternal values," their seriousness in play, their lack of dignity; clowns and gods in one; the saint and the rabble.... Imitation as an imperious instinct.--Do not artists of ascending life and artists of degeneration belong to all phases? ... Yes!

817.

Would any link be missing in the whole chain of science and art, if woman, if woman's work, were excluded from it? Let us acknowledge the exception--it proves the rule--that woman is capable of perfection in everything which does not constitute a work: in letters, in memoirs, in the most intricate handiwork--in short, in everything which is not a craft; and just precisely because in the things mentioned woman perfects herself, because in them she obeys the only artistic impulse in her nature,--which is to captivate.... But what has woman to do with the passionate indifference of the genuine artist who sees more importance in a breath, in a sound, in the merest trifle, than in himself?--who with all his five fingers gropes for his most secret and hidden treasures?--who attributes no value to anything unless it knows how to take shape (unless it surrenders itself, unless it visualises itself in some way). Art as it is practised by artists--do you not understand what it is? is it not an outrage on all _our pudeurs? ..._ Only in this century has woman dared to try her hand at literature ("_Vers la canaille plumière écrivassière,"_ to speak with old Mirabeau): woman now writes, she now paints, she is losing her instincts. And to what purpose, if one may put such a question?

818.

A man is an artist to the extent to which he regards everything that inartistic people call "form" as the actual substance, as the "principal" thing. With such ideas a man certainly belongs to a world upside down: for henceforward substance seems to him something merely formal,--his own life included.

819.

A sense for, and a delight in, nuances (which is characteristic of modernity), in that which is not general, runs counter to the instinct which finds its joy and its strength in grasping what is typical: like Greek taste in its best period. In this there is an overcoming of the plenitude of life; restraint dominates, the peace of the strong soul which is slow to move and which feels a certain repugnance towards excessive activity is defeated. The general rule, the law, is honoured and made prominent, conversely, the exception is laid aside, and shades are suppressed. All that which is firm, mighty, solid, life resting on a broad and powerful basis, concealing its strength this pleases: _i.e._ it corresponds with what we think of ourselves.

820.

In the main I am much more in favour of artists than any philosopher that has appeared hitherto: artists, at least, did not lose sight of the great course which life pursues; they loved the things "of this world,"--they loved their senses. To strive after "spirituality," in cases where this is not pure hypocrisy or self-deception, seems to me to be either a misunderstanding, a disease, or a cure, I wish myself, and all those who live without the troubles of a puritanical conscience, and who are able to live in this way, an ever greater spiritualisation and multiplication of the senses. Indeed, we would fain be grateful to the senses for their subtlety, power, and plenitude, and on that account offer them the best we have in the way of spirit. What do we care about priestly and metaphysical anathemas upon the senses? We no longer require to treat them in this way: it is a sign of well-constitutedness when a man like Goethe clings with ever greater joy and heartiness to the "things of this world"--in this way he holds firmly to the grand concept of mankind, which is that man becomes the glorifying power of existence when he learns to glorify himself.

821.

Pessimism in art?--The artist gradually learns to like for their own sake, those means which bring about the condition of æsthetic elation; extreme delicacy and glory of colour, definite delineation, quality of tone; distinctness where in normal conditions distinctness is absent. All distinct things, all nuances, in so far as they recall extreme degrees of power which give rise to intoxication, kindle this feeling of intoxication by association;--the effect of works of art is the excitation of the state which creates art, of æsthetic intoxication.

The essential feature in art is its power of perfecting existence, its production of perfection and plenitude; art is essentially the affirmation, the blessing, and the deification of existence.... What does a pessimistic art signify? Is it not a _contradictio_?--Yes.--Schopenhauer is in error when he makes certain works of art serve the purpose of pessimism. Tragedy does not teach "resignation." ... To represent terrible and questionable things is, in itself, the sign of an instinct of power and magnificence in the artist; he doesn't fear them.... There is no such thing as a pessimistic, art.... Art affirms. Job affirms. But Zola? and the Goncourts?--the things they show us are ugly, their reason, however, for showing them to us is their love of ugliness ... I don't care what you say! You simply deceive yourselves if you think otherwise.--What a relief Dostoievsky is!

822.

If I have sufficiently initiated my readers into the doctrine that even "goodness," in the whole comedy of existence, represents a form of exhaustion, they will now credit Christianity with consistency for having conceived the good to be the ugly. In this respect Christianity was right.

It is absolutely unworthy of a philosopher to say that "the good and the beautiful are one"; if he should add "and also the true," he deserves to be thrashed. Truth is ugly.

Art is with us in order that we may not perish through truth.

823.

Moralising tendencies may be combated with art. Art is freedom from moral bigotry and philosophy _à la_ Little Jack Horner: or it may be the mockery of these things. The flight to Nature, where beauty and terribleness are coupled. The concept of the great man.

--Fragile, useless souls-de-luxe, which are disconcerted by a mere breath of wind, "beautiful souls."

--Ancient ideals, in their inexorable hardness and brutality, ought to be awakened, as the mightiest of monsters that they are.

--We should feel a boisterous delight in the psychological perception of how all moralised artists become worms and actors without knowing it.

--The falsity of art, its immorality, must be brought into the light of day.

--The "fundamental idealising powers" (sensuality, intoxication, excessive animality) should be brought to light.

824.

Modern counterfeit practices in the arts: regarded as necessary--that is to say, as fully in keeping with the needs most proper to the modern soul.

The gaps in the gifts, and still more in the education, antecedents, and schooling of modern artists, are now filled up in this way:--

First: A less artistic public is sought which is capable of unlimited love (and is capable of falling on its knees before a personality). The superstition of our century, the belief in "genius," assists this process.

Secondly; Artists harangue the dark instincts of the dissatisfied, the ambitious, and the self-deceivers of a democratic age: the importance of poses.

Thirdly: The procedures of one art are transferred to the realm of another; the object of art is confounded with that of science, with that of the Church, or with that of the interests of the race (nationalism), or with that of philosophy--a man rings all bells at once, and awakens the vague suspicion that he is a god.

Fourthly: Artists flatter women, sufferers, and indignant folk. Narcotics and opiates are made to preponderate in art. The fancy of cultured people, and of the readers of poetry and ancient history, is tickled.

825.

We must distinguish between the "public" and the "select"; to satisfy the public a man must be a charlatan to-day, to satisfy the select he _will_ be a virtuoso and nothing else. The geniuses peculiar to our century overcame this distinction, they were great for both; the great charlatanry of Victor Hugo and Richard Wagner was coupled with such genuine virtuosity that it even satisfied the most refined artistic connoisseurs. This is why greatness is lacking: these geniuses had a double outlook; first, they catered for the coarsest needs, and then for the most refined.

826.

False "accentuation": (1) In romanticism, this unremitting "_expressivo_" is not a sign of strength, but of a feeling of deficiency;

(2) Picturesque music, the so-called dramatic kind, is above all easier (as is also the brutal scandalmongering and the juxtaposition of facts and traits in realistic novels);

(3) "Passion" as a matter of nerves and exhausted souls; likewise the delight in high mountains, deserts, storms, orgies, and disgusting details,--in bulkiness and massiveness (historians, for instance); as a matter of fact, there is actually a cult of exaggerated feelings (how is it that in stronger ages art desired just the opposite--a restraint of passion?);

(4) The preference for exciting materials (_Erotica_ or _Socialistica_ or _Pathologica_): all these things are the signs of the style of public that is being catered for to-day--that is to say, for overworked, absentminded, or enfeebled people.

Such people must be tyrannised over in order to be affected.

827.

Modern art is the art of tyrannising. A coarse and salient definiteness in delineation; the motive simplified into a formula; formulæ tyrannise. Wild arabesques within the lines; overwhelming masses, before which the senses are confused; brutality in coloration, in subject-matter, in the desires. Examples: Zola, Wagner, and, in a more spiritualised degree, Taine. Hence logic, massiveness, and brutality.

828.

In regard to the painter: _Tous ces modernes sont des poètes qui ont voulu être peintres, L'un a cherché des drames dans l'histoire, l'autre des scènes de mœurs, celui ci traduit des religions, celui là une philosophie._ One imitates Raphael, another the early Italian masters. The landscapists employ trees and clouds in order to make odes and elegies. Not one is simply a painter; they are all archæologists, psychologists, and impresarios of one or another kind of event or theory. They enjoy our erudition and our philosophy. Like us, they are full, and too full, of general ideas. They like a form, not because it is what it is, but because of what it expresses. They are the scions of a learned, tormented, and reflecting generation, a thousand miles away from the Old Masters who never read, and only concerned themselves with feasting their eyes.

829.

At bottom, even Wagner's music, in so far as it stands for the whole of French romanticism, is literature: the charm of exoticism (strange times, customs, passions), exercised upon sensitive cosy-corner people. The delight of entering into extremely distant and prehistoric lands to which books lead one, and by which means the whole horizon is painted with new colours and new possibilities.... Dreams of still more distant and unexploited worlds; disdain of the boulevards. ... For Nationalism, let us not deceive ourselves, is also only a form of exoticism.... Romantic musicians merely relate what exotic books have made of them: people would fain experience exotic sensations and passions according to Florentine and Venetian taste; finally they are satisfied to look for them in an image.... The essential factor is the kind of novel desire, the desire to imitate, the desire to live as people have lived once before in the past, and the disguise and dissimulation of the soul.... Romantic art is only an emergency exit from defective "reality."

The attempt to perform new things: revolution, Napoleon. Napoleon represents the passion of new spiritual possibilities, of an extension of the soul's domain.

The greater the debility of the will, the greater the extravagances in the desire to feel, to represent, and to dream new things.--The result of the excesses which have been indulged in: an insatiable thirst for unrestrained feelings.... Foreign literatures afford the strongest spices.

830.

Winckelmann's and Goethe's Greeks, Victor Hugo's Orientals, Wagner's Edda characters, Walter Scott's Englishmen of the thirteenth century--some day the whole comedy will be exposed! All of it was disproportionately historical and false, _but_--modern.

831.

Concerning the characteristics of national genius in regard to the strange and to the borrowed--

English genius vulgarises and makes realistic everything it sees;

The French whittles down, simplifies, rationalises, embellishes;

The German muddles, compromises, involves, and infects everything with morality;

The Italian has made by far the freest and most subtle use of borrowed material, and has enriched it with a hundred times more beauty than it ever drew out of it: it is the richest genius, it had the most to bestow.

832.

The Jews, with Heinrich Heine and Offenbach, approached genius in the sphere of art. The latter was the most intellectual and most high-spirited satyr, who as a musician abided by great tradition, and who, for him who has something more than ears, is a real relief after the sentimental and, at bottom, degenerate musicians of German romanticism.

833.

Offenbach; trench music imbued with Voltaire's intellect, free, wanton, with a slight sardonic grin, but clear and intellectual almost to the point of banality (Offenbach never titivates), and free from the _mignardise_ of morbid or blond-Viennese sensuality.

834.

If by artistic genius we understand the most consummate freedom within the law, divine ease, and facility in overcoming the greatest difficulties, then Offenbach has even more right to the title genius than Wagner has. Wagner is heavy and clumsy: nothing is more foreign to him than the moments of wanton perfection which this clown Offenbach achieves as many as five times, six times, in nearly every one of his buffooneries. But by genius we ought perhaps to understand something else.

835.

Concerning "music."--French, German, and Italian music. (Our most debased periods in a political sense are our most productive. The Slavs?)--The ballet, which is the outcome of excessive study of the history of strange civilisations, has become master of opera.--Stage music and musicians music.--It is an error to suppose that what Wagner composed was _a. form_: it was rather formlessness. The possibilities of dramatic construction have yet to be discovered.--Rhythm. "Expression" at all costs. Harlotry in instrumentation.--All honour to Heinrich Schütz; all honour to Mendelssohn: in them we find an element of Goethe, but nowhere else! (We also find another element of Goethe coming to blossom in Rahel; a third element in Heinrich Heine.)

836.

Descriptive music leaves reality to work its effects alone.... All these kinds of art are easier, and more easy to imitate; poorly gifted people have recourse to them. The appeal to the instincts; suggestive art.

837.

Concerning our modern music.--The decay of melody, like the decay of "ideas," and of the freedom of intellectual activity, is a piece of clumsiness and obtuseness, which is developing itself into new feats of daring and even into principles;--in the end man has only the principles of his gifts, or of his lack of gifts.

"Dramatic music"--nonsense! It is simply bad music.... "Feeling" and "passion" are merely substitutes when lofty intellectuality and the joy of it (_e.g._ Voltaire's) can no longer be attained. Expressed technically, feeling and "passion" are easier; they presuppose a much poorer kind of artist. The recourse to drama betrays that an artist is much more a master in tricky means than in genuine ones. To-day we have both dramatic painting and dramatic poetry, etc.

838.

What we lack in music is an æsthetic which would impose laws upon musicians and give them a conscience; and as a result of this we lack a real contest concerning "principles."--For as musicians we laugh at Herbart's velleities in this department just as heartily as we laugh at Schopenhauer's. As a matter of fact, tremendous difficulties present themselves here. We no longer know on what basis to found our concepts of what is exemplary, masterly, perfect. With the instincts of old loves and old admiration we grope about in a realm of values, and we almost believe, "that is good which pleases us".... I am always suspicious when I hear people everywhere speak innocently of Beethoven as a "classic"; what I would maintain, and with some seventy, is that, in other arts, a classic is the very reverse of Beethoven. But when the complete and glaring dissolution of style, Wagner's so-called dramatic style, is taught and honoured as exemplary, as masterly, as progressive, then my impatience exceeds all bounds. Dramatic style in music, as Wagner understood it, is simply renunciation of all style whatever; it is the assumption that something else, namely, drama, is a hundred times more important than music. Wagner can paint; he does not use music for the sake of music, with it he accentuates attitudes; he is a poet. Finally he made an appeal to beautiful feelings and heaving breasts, just as all other theatrical artists have done, and with it all he converted women and even those whose souls thirst for culture to him. But what do women and the uncultured care about music? All these people have no conscience for art: none of them suffer when the first and fundamental virtues of an art are scorned and trodden upon in favour of that which is merely secondary (as _ancilla dramaturgica_). What good can come of all extension in the means of expression, when that which is expressed, art itself, has lost all its law and order? The picturesque pomp and power of tones, the symbolism of sound, rhythm, the colour effects of harmony and discord, the suggestive significance of music, the whole sensuality of this art which Wagner made prevail--it is all this that Wagner derived, developed, and drew out of music. Victor Hugo did something very similar for language: but already people in France are asking themselves, in regard to the case of Victor Hugo, whether language was not corrupted by him, whether reason, intellectuality, and thorough conformity to law in language are not suppressed when the sensuality of expression is elevated to a high place? Is it not a sign of decadence that the poets in France have become plastic artists, and that the musicians of Germany have become actors and culturemongers?

839.

To-day there exists a sort of musical pessimism even among people who are not musicians. Who has not met and cursed the confounded youthlet who torments his piano until it shrieks with despair, and who single-handed heaves the slime of the most lugubrious and drabby harmonies before him? By so doing a man betrays himself as a pessimist.... It is open to question, though, whether he also proves himself a musician by this means. I for my part could never be made to believe it. Wagnerite _pur sang_ is unmusical, he submits to the elementary forces of music very much as a woman submits to the will of the man who hypnotises her--and in order to be able to do this he must not be made suspicious _in rebus musicis et musicantibus_ by a too severe or too delicate conscience. I said "very much as"--but in this respect I spoke perhaps more than a parable. Let any one consider the means which Wagner uses by preference, when he wishes to make an effect (means which for the greater part he first had to invent), they are appallingly similar to the means by which a hypnotist exercises his power (the choice of his movements, the general colour of his orchestration; the excruciating evasion of consistency, and fairness and squareness, in rhythm; the creepiness, the soothing touch, the mystery, the hysteria of his "unending melody"). And is the condition to which the overture to _Lohengrin,_ for instance, reduces the men, and still more the women, in the audience, so essentially different from the somnambulistic trance? On one occasion after the overture in question had been played, I heard an Italian lady say, with her eyes half closed, in a way in which female Wagnerites are adepts: "_Come si dorme con questa musica!_"[10]

[Footnote 10: "How the music makes one sleep!"--Tr.]

840.

Religion in music.--What a large amount of satisfaction all religious needs get out of Wagnerian music, though this is never acknowledged or even understood! How much prayer, virtue, unction, virginity, salvation, speaks through this music!... Oh what capital this cunning saint, who leads and seduces us back to everything that was once believed in, makes out of the fact that he may dispense with words and concepts! ... Our intellectual conscience has no need to feel ashamed--it stands apart--if any old instinct puts its trembling lips to the rim of forbidden philtres.... This is shrewd and healthy, and, in so far as it betrays a certain shame in regard to the satisfaction of the religious instinct, it is even a good sign.... Cunning Christianity: the type of the music which came from the "last Wagner."

841.

I distinguish between courage before persons, courage before things, and courage on paper. The latter was the courage of David Strauss, for instance. I distinguish again between the courage before witnesses and the courage without witnesses: the courage of a Christian, or of believers in God in general, can never be the courage without witnesses--but on this score alone Christian courage stands condemned. Finally, I distinguish between the courage which is temperamental and the courage which is the fear of fear; a single instance of the latter kind is moral courage. To this list the courage of despair should be added.

This is the courage which Wagner possessed. His attitude in regard to music was at bottom a desperate one. He lacked two things which go to make up a good musician: nature and nurture, the predisposition for music and the discipline and schooling which music requires. He had courage: out of this deficiency he established a principle; he invented a kind of music for himself. The dramatic music which he invented was the music which he was able to compose,--its limitations are Wagner's limitations.

And he was misunderstood!--Was he really misunderstood?... Such is the case with five-sixths of the artists of to-day. Wagner is their Saviour: five-sixths, moreover, is the "lowest proportion." In any case where Nature has shown herself without reserve, and wherever culture is an accident, a mere attempt, a piece of dilettantism, the artist turns instinctively--what do I say?--I mean enthusiastically, to Wagner; as the poet says: "Half drew he him, and half sank he."[11]

[Footnote 11: This is an adapted quotation from Goethe's poem, "The Fisherman." The translation is E. A. Bowring's.--Tr.]

842.

"Music" and the grand style. The greatness of an artist is not to be measured by the beautiful feelings which he evokes: let this belief be left to the girls. It should be measured according to the extent to which he approaches the grand style, according to the extent to which he is capable of the grand style. This style and great passion have this in common--that they scorn to please; that they forget to persuade; that they command: that they will.... To become master of the chaos which is in one; to compel one's inner chaos to assume form; to become consistent, simple, unequivocal, mathematical, law this is the great ambition here. By means of it one repels; nothing so much endears people to such powerful men as this,--a desert seems to lie around them, they impose silence upon all, and awe every one with the greatness Of their sacrilege.... All arts know this kind of aspirant to the grand style: why are they absent in music? Never yet has a musician built as that architect did who erected the Palazzo Pitti.... This is a problem. Does music perhaps belong to that culture in which the reign of powerful men of various types is already at an end? Is the concept "grand style" in fact a contradiction of the soul of music,--of "the Woman" in our music? ...

With this I touch upon the cardinal question: how should all our music be classified? The age of classical taste knows nothing that can be compared with it: it bloomed when the world of the Renaissance reached its evening, when "freedom" had already bidden farewell to both men and their customs--is it characteristic of music to be Counter-Renaissance? Is music, perchance, the sister of the baroque style, seeing that in any case they were contemporaries? Is not music, modern music, already decadence? ...

I have put my finger before on this question: whether music is not an example of Counter-Renaissance art? whether it is not the next of kin to the baroque style? whether it has not grown in Opposition to all classic taste, so that any aspiration to classicism is forbidden by the very nature of music?

The answer to this most important of all questions of values would not be a very doubtful one, if people thoroughly understood the fact that music attains to its highest maturity and plenitude as romanticism--likewise as a reactionary movement against classicism.

Mozart, a delicate and lovable soul, but quite eighteenth century, even in his serious lapses ... Beethoven, the first great romanticist according to the French conception of romanticism, just as Wagner is the last great romanticist ... both of them are instinctive opponents of classical taste, of severe style--not to speak of "grand" in this regard.

843.

Romanticism: an ambiguous question, like all modern questions.

The æsthetic conditions are twofold:--

The abundant and generous, as opposed to the seeking and the desiring.

844.

A romanticist is an artist whose great dissatisfaction with himself makes him productive--; who looks away from himself and his fellows, and sometimes, therefore, looks backwards.

845.

Is art the result of dissatisfaction with reality? or is it the expression of gratitude for happiness experienced? In the first case, it is romanticism; in the second, it is glorification and dithyramb (in short, apotheosis art): even Raphael belongs to this, except for the fact that he was guilty of the duplicity of having defied the appearance of the Christian view of the world. He was thankful for life precisely where it was not exactly Christian.

With a moral interpretation the world is insufferable; Christianity was the attempt to overcome the world with morality: _i.e._ to deny it. _In praxi_ such a mad experiment--an imbecile elevation of man above the world--could only end in the beglooming, the dwarfing, and the impoverishment of mankind: the only kind of man who gained anything by it, who was promoted by it, was the most mediocre, the most harmless and gregarious type.

Homer as an apotheosis artist; Rubens also. Music has not yet had such an artist.

The idealisation of the great criminal (the feeling for his greatness) is Greek; the depreciation, the slander, the contempt of the sinner, is Judæo-Christian.

846.

Romanticism and its opposite. In regard to all æsthetic values I now avail myself of this fundamental distinction: in every individual case I ask myself has hunger or has superabundance been creative here? At first another distinction might perhaps seem preferable, it is far more obvious,--_e.g._ the distinction which decides whether a desire for stability, for eternity, for Being, or whether a desire for destruction, for change, for Becoming, has been the cause of creation. But both kinds of desire, when examined more closely, prove to be ambiguous, and really susceptible of interpretation only according to that scheme already mentioned and which I think is rightly preferred.

The desire for destruction, for change, for Becoming, may be the expression of an overflowing power pregnant with promises for the future (my term for this, as is well known, is Dionysian); it may, however, also be the hate of the ill-constituted, of the needy and of the physiologically botched, that destroys, and must destroy, because such creatures are indignant at, and annoyed by everything lasting and stable.

The act of immortalising can, on the other hand, be the outcome of gratitude and love: an art which has this origin is always an apotheosis art; dithyrambic, as perhaps with Rubens, happy, as perhaps with Hafiz; bright and gracious, and shedding a ray of glory over all things, as in Goethe. But it may also, however, be the outcome of the tyrannical will of the great sufferer who would make the most personal, individual, and narrow trait about him, the actual idiosyncrasy of his pain--in fact, into a binding law and imposition, and who thus wreaks his revenge upon all things by stamping, branding, and violating them with the image of his torment. The latter case is romantic pessimism in its highest form, whether this be Schopenhauerian voluntarism or Wagnerian music.

847.

It is a question whether the antithesis, classic and romantic, does not conceal that other antithesis, the active and the reactive.

848.

In order to be a classic, one must be possessed of all the strong and apparently contradictory gifts and passions: but in such a way that they run in harness together, and culminate simultaneously in elevating a certain species of literature or art or politics to its height and zenith (they must not do this after that elevation has taken place ...). They must reflect the complete state (either of a people or of a culture), and express its most profound and most secret nature, at a time when it is still stable and not yet discoloured by the imitation of foreign things (or when it is still dependent ...); not a reactive but a deliberate and progressive spirit, saying Yea in all circumstances, even in its hate.

"And does not the highest personal value belong thereto?" It is worth considering whether moral prejudices do not perhaps exercise their influence here, and whether great moral loftiness is not perhaps a contradiction of the classical? ... Whether the moral monsters must not necessarily be romantic in word and deed? Any such preponderance of one virtue over others (as in the case of the moral monster) is precisely what with most hostility counteracts the classical power in equilibrium, supposing a people manifested this moral loftiness and were classical notwithstanding, we should have to conclude boldly that they were also on the same high level in immorality! this was perhaps the case with Shakespeare (provided that he was really Lord Bacon).

849.

Concerning the future. Against the romanticism of great passion.--We must understand how a certain modicum of coldness, lucidity, and hardness is inseparable from all classical taste: above all consistency, happy intellectuality, "the three unities," concentration, hatred of all feeling, of all sentimentality, of all _esprit,_ hatred of all multiformity, of all uncertainty, evasiveness, and of all nebulosity, as also of all brevity, finicking, prettiness and good nature. Artistic formulæ must not be played with: life must be remodelled so that it should be forced to formulate itself accordingly.

It is really an exhilarating spectacle which we have only learned to laugh at quite recently, because we have only seen through it quite recently: this spectacle of Herder's, Winckelmann's, Goethe's, and Hegel's contemporaries claiming that they had rediscovered the classical ideal ... and at the same time, Shakespeare! And this same crew of men had scurvily repudiated all relationship with the classical school of France! As if the essential principle could not have been learnt as well here as elsewhere! ... But what people wanted was "nature," and "naturalness": Oh, the stupidity of it! It was thought that classicism was a kind of naturalness!

Without either prejudice or indulgence we should try and investigate upon what soil a classical taste can be evolved. The hardening, the simplification, the strengthening, and the bedevilling of man are inseparable from classical taste. Logical and psychological simplification. A contempt of detail, of complexity, of obscurity.

The romanticists of Germany do not protest against classicism, but against reason, against illumination, against taste, against the eighteenth century.

The essence of romantico-Wagnerian music is the opposite of the classical spirit.

The will to unity (because unity tyrannises. _e.g._ the listener and the spectator), but the artist's inability to tyrannise over himself where it is most needed--that is to say, in regard to the work itself (in regard to knowing what to leave out, what to shorten, what to clarify, what to simplify). The overwhelming by means of masses (Wagner, Victor Hugo, Zola, Taine).

850.

The Nihilism of artists.--Nature is cruel in her cheerfulness; cynical in her sunrises. We are hostile to emotions. We flee thither where Nature moves our senses and our imagination, where we have nothing to love, where we are not reminded of the moral semblances and delicacies of this northern nature; and the same applies to the arts. We prefer that which no longer reminds us of good and evil. Our moral sensibility and tenderness seem to be relieved in the heart of terrible and happy Nature, in the fatalism of the senses and forces. Life without goodness.

Great well-being arises from contemplating Nature's indifference to good and evil.

No justice in history, no goodness in Nature. That is why the pessimist when he is an artist prefers those historical subjects where the absence of justice reveals itself with magnificent simplicity, where perfection actually comes to expression--and likewise he prefers that in Nature, where her callous evil character is not hypocritically concealed, where that character is seen in perfection.... The Nihilistic artist betrays himself in willing and preferring cynical history and cynical Nature.

851.

What is tragic?--Again and again I have pointed to the great misunderstanding of Aristotle in maintaining that the tragic emotions were the two depressing emotions--fear and pity. Had he been right, tragedy would be an art unfriendly to life: it would have been necessary to caution people against it as against something generally harmful and suspicious. Art, otherwise the great stimulus of life, the great intoxicant of life, the great will to life, here became a tool of decadence, the hand-maiden of pessimism and ill-health (for to suppose, as Aristotle supposed, that by exciting these emotions we thereby purged people of them, is simply an error). Something which habitually excites fear or pity, disorganises, weakens, and discourages: and supposing Schopenhauer were right in thinking that tragedy taught resignation (_i.e._ a meek renunciation of happiness, hope, and of the will to live), this would presuppose an art in which art itself was denied. Tragedy would then constitute a process of dissolution; the instinct of life would destroy itself in the instinct of art. Christianity, Nihilism, tragic art, physiological decadence; these things would then be linked, they would then preponderate together and assist each other onwards--downwards.... Tragedy would thus be a symptom of decline.

This theory may be refuted in the most cold-blooded way, namely, by measuring the effect of a tragic emotion by means of a dynamometer The result would be a fact which only the bottomless falsity of a doctrinaire could misunderstand: that tragedy is a tonic. If Schopenhauer refuses to see the truth here, if he regards general depression as a tragic condition, if he would have informed the Greeks (who to his disgust were not "resigned") that they did not firmly possess the highest principles of life: it is only owing to his _parti pris,_ to the need of consistency in his system, to the dishonesty of the doctrinaire--that dreadful dishonesty which step for step corrupted the whole psychology of Schopenhauer (he who had arbitrarily and almost violently misunderstood genius, art itself, morality, pagan religion, beauty, knowledge, and almost everything).

852.

The tragic artist.--Whether, and in regard to what, the judgment "beautiful" is established is a question of an individual's or of a people's strength The feeling of plenitude, of overflowing strength (which gaily and courageously meets many an obstacle before which the weakling shudders)--the feeling of power utters the judgment "beautiful" concerning things and conditions which the instinct of impotence can only value as hateful and ugly. The _flair_ which enables us to decide whether the objects we encounter are dangerous, problematic, or alluring, likewise determines our æsthetic Yea. ("This is beautiful," is an affirmation).

From this we see that, generally speaking, a preference for questionable and terrible things is a symptom of strength; whereas the taste for pretty and charming trifles is characteristic of the weak and the delicate. The love of tragedy is typical of strong ages and characters: its _non plus ultra_ is perhaps the _Divina Commedia._ It is the heroic spirits which in tragic cruelty say Yea unto themselves: they are hard enough to feel pain as a pleasure.

On the other hand, supposing weaklings desire to get pleasure from an art which was not designed for them, what interpretation must we suppose they would like to give tragedy in order to make it suit their taste? They would interpret their own feeling of value into it: _e.g._ the "triumph of the moral order of things," or the teaching of the "uselessness of existence," or the incitement to "resignation" (or also half-medicinal and half-moral outpourings, _à la_ Aristotle). Finally, the art of terrible natures, in so far as it may excite the nerves, may be regarded by the weak and exhausted as a stimulus: this is now taking place, for instance, in the case of the admiration meted out to Wagner's art. A test of man's well-being and consciousness of power is the extent to which he can acknowledge the terrible and questionable character of things, and whether he is in any need of a faith at the end.

This kind of artistic pessimism is precisely the reverse of that religio-moral pessimism which suffers from the corruption of man and the enigmatic character of existence: the latter insists upon deliverance, or at least upon the hope of deliverance. Those who suffer, doubt, and distrust themselves,--the sick, in other words,--have in all ages required the transporting influence of visions in order to be able to exist at all (the notion "blessedness" arose in this way). A similar case would be that of the artists of decadence, who at bottom maintain a Nihilistic attitude to life, and take refuge in the beauty of form,--in those select cases in which Nature is perfect, in which she is indifferently great and indifferently beautiful. (The "love of the beautiful" may thus be something very different from the ability to see or create the beautiful: it may be the expression of impotence in this respect.) The most convincing artists are those who make harmony ring out of every discord, and who benefit all things by the gift of their power and inner harmony: in every work of art they merely reveal the symbol of their inmost experiences--their creation is gratitude for life.

The depth of the tragic artist consists in the fact that his æsthetic instinct surveys the more remote results, that he does not halt shortsightedly at the thing that is nearest, that he says Yea to the whole cosmic economy, which justifies the terrible, the evil, and the questionable; which more than justifies it.

853.

Art in the "Birth of Tragedy."

I.

The conception of the work which lies right in the background of this book, is extraordinarily gloomy and unpleasant: among all the types of pessimism which have ever been known hitherto, none seems to have attained to this degree of malice. The contrast of a true and of an apparent world is entirely absent here: there is but one world, and it is false, cruel, contradictory, seductive, and without sense. A world, thus constituted is the true world. We are in need of lies in order to rise superior to this reality, to this truth--that is to say, in order to live.... That lies should be necessary to life is part and parcel of the terrible and questionable character of existence.

Metaphysics, morality, religion, science, in this book, all these things are regarded merely as different forms of falsehood: by means of them we are led to believe in life. "Life, must inspire confidence"; the task which this imposes upon us is enormous. In order to solve, this problem man must already be a liar in his heart, but he must above all else be an artist. And he is that. Metaphysics, religion, morality, science, all these things are but the offshoot of his will to art, to falsehood, to a flight from "truth," to a denial of "truth." This ability, this artistic capacity _par excellence_ of man--thanks to which he overcomes reality with lies,--is a quality which he has in common with all other forms of existence. He himself is indeed a piece of reality, of truth, of nature: how could he help being also a piece of genius in prevarication!

The fact that the character of existence is misunderstood, is the profoundest and the highest secret motive behind everything relating to virtue, science, piety, and art. To be blind to many things, to see many things falsely, to fancy many things: Oh, how clever man has been in those circumstances in which he believed he was anything but clever! Love, enthusiasm, "God"--are but subtle forms of ultimate Self-deception; they are but seductions to life and to the belief in life! In those moments when man was deceived, when he had befooled himself and when he believed in life: Oh, how his spirit swelled within him! Oh, what ecstasies he had! What power he felt! And what artistic triumphs in the feeling of power! ... Man had once more become master of "matter,"--master of truth! ... And whenever man rejoices it is always in the same way: he rejoices as an artist, his power is his joy, he enjoys falsehood as his power....

II.

Art and nothing else! Art is the great means of making life possible, the great seducer to life, the great stimulus of life.

Art is the only superior counter-agent to all will to the denial of life; it is _par excellence_ the anti-Christian, the anti-Buddhistic, the anti-Nihilistic force.

Art is the alleviation of the seeker after knowledge,--of him who recognises the terrible and questionable character Of existence, and who will recognise it,--of the tragic seeker after knowledge.

Art is the alleviation of the man of action,--of him who not only sees the terrible and questionable character of existence, but also lives it, will live it,--of the tragic and warlike man, the hero. Art is the alleviation of the sufferer,--as the way to states in which pain is willed, is transfigured, is deified, where suffering is a form of great ecstasy.

III.

It is clear that in this book pessimism, or, better still, Nihilism, stands for "truth." But truth is not postulated as the highest measure of value, and still less as the highest power. The will to appearance, to illusion, to deception, to becoming, and to change (to objective deception), is here regarded as more profound, as more primeval, as more metaphysical than the will to truth, to reality, to appearance: the latter is merely a form of the will to illusion. Happiness is likewise conceived as more primeval than pain: and pain is considered as conditioned, as a consequence Of the will to happiness (of the will to Becoming, to growth, to forming, i.e. to creating; in creating, however, destruction is included). The highest state of Yea-saying to existence is conceived as one from which the greatest pain may not be excluded: the tragico-Dionysian state.

IV.

In this way this book is even anti-pessimistic, namely, in the sense that it teaches something which is stronger than pessimism and which is more "divine" than truth: Art. Nobody, it would seem, would be more ready seriously to utter a radical denial of life, an actual denial of action even more than a denial of life, than the author of this book. Except that he knows--for he has experienced it, and perhaps experienced little else!--that art is of more value than truth.

Even in the preface, in which Richard Wagner is, as it were, invited to join with him in conversation, the author expresses this article of faith, this gospel for artists; "Art is the only task of life, art is the metaphysical activity of life...."

FOURTH BOOK

DISCIPLINE AND BREEDING.

I.

THE ORDER OF RANK.

1. The Doctrine of the Order of Rank.

854.

In this age of universal suffrage, in which everybody is allowed to sit in judgment upon everything and everybody, I feel compelled to re-establish the order of rank.

855.

Quanta of power alone determine rank and distinguish rank: nothing else does.

856.

The will to power.--How must those men be constituted who would undertake this transvaluation? The order of rank as the order of power: war and danger are the prerequisites which allow of a rank maintaining its conditions. The prodigious example: man in Nature--the weakest and shrewdest creature making himself master, and putting a yoke upon all less intelligent forces.

857.

I distinguish between the type which represents ascending life and that which represents decay, decomposition and weakness. Ought one to suppose that the question of rank between these two types can be at all doubtful?

858.

The modicum of power which you represent decides your rank; all the rest is cowardice.

859.

The advantages of standing detached from one's age.--Detached from the two movements, that of individualism and that of collectivist morality; for even the first does not recognise the order of rank, and would give one individual the same freedom as another. My thoughts are not concerned with the degree of freedom which should be granted to the one or to the other or to all, but with the degree of power which the one or the other should exercise over his neighbour or over all; and more especially with the question to what extent a sacrifice of freedom, or even enslavement, may afford the basis for the cultivation, of a _superior_ type. In plain words: _how could one sacrifice the development of mankind_ in order to assist a higher species than man to come into being.

860.

Concerning rank.--The terrible consequences of "equality"--in the end everybody thinks he has the right to every problem. All order of rank has vanished.

861.

It is necessary for _higher_ men to declare war upon the masses! In all directions mediocre people are joining hands in order to make themselves masters. Everything that pampers, that softens, and that brings the "people" or "woman" to the front, operates in favour of universal suffrage,--that is to say, the dominion of _inferior_ men. But we must make reprisals, and draw the whole state of affairs (which commenced in Europe with Christianity) to the light of day and to judgment.

862.

A teaching is needed which is strong enough to work in a _disciplinary_ manner; it should operate in such a way as to strengthen the strong and to paralyse and smash up the world-weary.

The annihilation of declining races. The decay of Europe. The annihilation of slave-tainted valuations. The dominion of the world as a means to the rearing of a higher type. The annihilation of the humbug which is called morality (Christianity as a hysterical kind of honesty in this regard: Augustine, Bunyan.) The annihilation of universal suffrage--that is to say, that system by means of which the lowest natures prescribe themselves as a law for higher natures. The annihilation of mediocrity and its prevalence. (The one-sided, the individuals--peoples; constitutional plenitude should be aimed at by means of the coupling of opposites; to this end race-combinations should be tried.) The new kind of courage--no _a priori_ truths (those who were accustomed to believe in something sought such truths!), but _free_ submission to a ruling thought, which has its time; for instance, time conceived as the quality of space, etc.

2. The Strong and the Weak.

863.

The notion, "strong and weak man" resolves itself into this, that in the first place much strength is inherited--the man is a total sum; in the other, _not yet enough_ (inadequate inheritance, subdivision of the inherited qualities). Weakness may be a _starting_ phenomenon: _not yet enough_; or a final phenomenon: "no more."

The determining point is there where great strength is present, or where a great amount of strength can be discharged. The mass, as the sum-total of the _weak,_ reacts _slowly;_ it defends itself against much for which it is too weak,--against that for which it has no use; it _never_ creates, it _never_ takes a step forward. This is opposed to the theory which denies the strong individual and would maintain that the "masses do everything." The difference is similar to that which obtains between separated generations: four or even five generations may lie between the masses and him who is the moving spirit--it is a _chronological_ difference.

The _values of the weak_ are in the van, because the strong have adopted them in order to _lead_ with them.

864.

Why the weak triumph.--On the whole, the sick and the weak have more _sympathy_ and are more "humane"; the sick and the weak have more intellect, and are more changeable more variegated, more entertaining--more malicious; the sick alone invented _malice._ (A morbid precocity is often to be observed among rickety, scrofulitic, and tuberculous people.) _Esprit:_ the property of older races; Jews, Frenchmen, Chinese. (The anti-Semites do not forgive the Jews for having both intellect--and money. Anti-Semites--another name for "bungled and botched.")

The sick and the weak have always had _fascination_ on their side; they are more _interesting_ than the healthy: the fool and the saint--the two most interesting kinds of men.... Closely related thereto is the "genius." The "great adventurers and criminals" and all great men, the most healthy in particular, have always been _sick_ at certain periods of their lives--great disturbances of the emotions, the passion for power, love, revenge, are all accompanied by very profound perturbations. And, as for decadence, every man who does not die prematurely manifests it in almost every respect--he therefore knows from experience the instincts which belong to it: for _half his life_ nearly every man is decadent.

And finally, woman! _One-half of mankind is weak,_ chronically sick, changeable, shifty woman requires strength in order to cleave to it; she also requires a religion of the weak which glorifies weakness, love, and modesty as divine: or, better still, she makes the strong weak--she _rules_ when she succeeds in overcoming the strong. Woman has always conspired with decadent types,--the priests, for instance, against the mighty, against the "strong," against _men._ Women avail themselves of children for the cult of

piety, pity, and love:--the _mother_ stands as the symbol of _convincing_ altruism.

Finally, the increase of civilisation with its necessary correlatives, the increase of morbid elements, of the _neurotic_ and _psychiatric_ and of the _criminal._ A sort of _intermediary species_ arises, the artist. He is distinct from those who are criminals as the result of weak wills and of the fear of society, although they may not yet be ripe for the asylum; but he has antennas which grope inquisitively into both spheres, this specific plant of culture, the modern artist, painter, musician, and, above all, novelist, who designates his particular kind of attitude with the very indefinite word "naturalism."... Lunatics, criminals, and realists[1] are on the increase: this is the sign of a growing culture plunging forward at headlong speed--that is to say, its excrement, its refuse, the rubbish that is shot from it every day, is beginning to acquire more importance, the retrogressive movement _keeps pace_ with the advance.

Finally, _the social mishmash,_ which is the result of revolution, of the establishment of equal rights, and of the superstition, the "equality of men." Thus the possessors of the instincts of decline (of resentment, of discontent, of the lust of destruction, of anarchy and Nihilism), as also the instincts of slavery, of cowardice, of craftiness, and of rascality, which are inherent among those classes of society which have long been suppressed, are beginning to get infused into the blood of all ranks. Two or three generations later, the race can no longer be recognised--everything has become _mob._ And thus there results a collective instinct against _selection,_ against every kind of _privilege_, and this instinct operates with such power, certainty, hardness, and cruelty that, as a matter of fact, in the end, even the privileged classes have to submit: all those who still wish to hold on to power flatter the mob, work with the mob, and must have the mob on their side--the "geniuses" _above all._ The latter become the _heralds_ of those feelings with which the mob can be inspired,--the expression of pity, of honour, even for all that suffers, all that is low and despised, and has lived under persecution, becomes predominant (types: Victor Hugo, Richard Wagner).--The rise of the mob signifies once more the rise of old values.

In the case of such an extreme movement, both in tempo and in means, as characterises our civilisation, man's ballast is shifted. Those men whose worth is greatest, and whose mission, as it were, is to compensate for the very great danger of such a morbid movement,--such men become dawdlers _par excellence_; they are slow to accept anything, and are tenacious; they are creatures that are relatively lasting in the midst of this vast mingling and changing of elements. In such circumstances power is necessarily relegated to the _mediocre: mediocrity,_ as the trustee and bearer of the future, consolidates itself against the rule of the mob and of eccentricities (both of which are, in most cases, united). In this way a new antagonist is evolved for exceptional men--or in certain cases a new temptation. Provided that they do not adapt themselves to the mob, and stand up for what satisfies the instincts of the disinherited, they will find it necessary to be "mediocre" and sound. They know: _mediocritas_ is also _aurea,_--it alone has command of money and _gold_ (of all that glitters ...).... And, once more, old virtue and the whole superannuated world of ideals in general secures a gifted host of special-pleaders.... Result: mediocrity acquires intellect, wit, and genius, it becomes entertaining, and even seductive.

***

Result.--A high culture can only stand upon a broad basis, upon a strongly and soundly consolidated mediocrity. In its service and assisted by it, _science_ and even art do their work. Science could not wish for a better state of affairs: in its essence it belongs to a middle-class type of man,--among exceptions it is out of place,--there is not anything aristocratic and still less anything anarchic in its instincts.--The power of the middle classes is then upheld by means of commerce, but, above all, by means of money-dealing: the instinct of great financiers is opposed to everything extreme--on this account the Jews are, for the present, the most _conservative_ power in the threatening and insecure conditions of modern Europe. They can have no use either for revolutions, for socialism, or for militarism: if they would have power, and if they should need it, even over the revolutionary party, this is only the result of what I have already said, and it in no way contradicts it. Against other extreme movements they may occasionally require to excite terror by showing how much power is in their hands. But their instinct itself is inveterately conservative and "mediocre, ... Wherever power exists, they know how to become mighty; but the application of their power always takes the same direction. The polite term for _mediocre,_ as is well known, is the word _"Liberal."_

Reflection.--It is all nonsense to suppose that this general _conquest of values_ is anti-biological. In order to explain it, we ought to try and show that it is the result of a certain interest of life to maintain the type "man," even by means of this method which leads to the prevalence of the weak and the physiologically botched--if things were otherwise, might man not cease to exist? Problem ...

The _enhancement_ of the type may prove fatal to the _maintenance of the species._ Why?--The experience of history shows that strong races _decimate_ each other _mutually,_ by means of war, lust for power, and venturousness; the strong emotions; wastefulness (strength is no longer capitalised, disturbed mental systems arise from excessive tension); their existence is a costly affair in short, they persistently give rise to friction _between themselves;_ periods of _profound slackness_ and torpidity intervene: all great ages have to be _paid for...._ The strong are, after all, weaker, less wilful, and more absurd than the average weak ones.

They are _squandering_ races. "_Permanence,_" in itself, can have no value: that which ought to be preferred thereto would be a shorter life for the species, but a life _richer_ in creations. It would remain to be proved that, even as things are, a richer sum of creations is attained than in the case of the shorter existence; _i.e._ that man, as a storehouse of power, attains to a much higher degree of dominion over things under the conditions which have existed hitherto.... We are here face to face with a problem of _economics._

[Footnote 1: The German word is "Naturalist," and really means "realist" in a bad sense.--Tr.]

865.

The state of mind which calls itself "idealism," and which will neither allow mediocrity to be mediocre nor woman to be woman! Do not make everything uniform! We should have a clear idea of how _dearly we have to pay for the establishment of a virtue;_ and that virtue is nothing generally desirable, but a _noble piece of madness,_ a beautiful exception, which gives us the privilege of feeling elated....

866.

It is _necessary_ to show _that a counter-movement is inevitably associated_ with any increasingly economical consumption of men and mankind, and with an ever more closely involved "machinery" of interests and services. I call this counter-movement the _separation of the luxurious surplus of mankind:_ by means of it a stronger kind, a higher type, must come to light, which has other conditions for its origin and for its maintenance than the average man. My concept, my metaphor for this type is, as you know, the word "Superman." Along the first road, which can now be completely surveyed, arose adaptation, stultification, higher Chinese culture, modesty in the Instincts, and satisfaction at the sight of the belittlement of man--a kind of _stationary level of mankind._ If ever we get that inevitable and imminent, general control of the economy of the earth, then mankind _can_ be used as machinery and find its best purpose in the service of this economy--as an enormous piece of clock-work consisting of ever smaller and ever more subtly adapted wheels; then all the dominating and commanding elements will become ever more superfluous; and the whole gains enormous energy, while the individual factors which compose it represent but small modicums of strength and of _value._ To oppose this dwarfing and adaptation of man to a specialised kind of utility, a reverse movement is needed -the procreation of the _synthetic_ man who _embodies_ everything and _justifies_ it; that man for whom the turning of mankind into a machine is a first condition of existence, for whom the rest of mankind is but soil on which he can devise his _higher mode_ of existence.

He is in need of the _opposition_ of the masses, of those who are "levelled down"; he requires that feeling of distance from them; he stands upon them, he lives on them. This higher form of _aristocracy_ is the form of the future. From the moral point of view, the collective machinery above described, that solidarity of all wheels, represents the most extreme example in the _exploitation of mankind_: but it presupposes the existence of those for whom such an exploitation would have some _meaning.[2]_ Otherwise it would signify, as a matter of fact, merely the general depreciation of the type man,--a _retrograde phenomenon_ on a grand scale.

Readers are beginning to see what I am combating--namely, _economic_ optimism: as if the genera] welfare of everybody must necessarily increase with the growing self-sacrifice of everybody. The very reverse seems to me to be the case, _the self-sacrifice of everybody amounts to a collective loss;_ man becomes _inferior_--so that nobody knows what end this monstrous purpose has served. A wherefore? a _new_ wherefore?--this is what mankind requires.

[Footnote 2: This sentence for ever distinguishes Nietzsche's aristocracy from our present plutocratic and industrial one, for which, at the present moment at any rate, it would be difficult to discover some meaning.--Tr.]

867.

The recognition of the _increase of collective power:_ we should calculate to what extent the ruin of individuals, of castes, of ages, and of peoples, is included in this general increase.

The transposition of the _ballast_ of a culture. The _cost_ of every vast growth: who bears it? _Why must it be enormous at the present time?_

868.

General aspect of the future European: the latter regarded as the most intelligent servile animal, very industrious, at bottom very modest, inquisitive to excess, multifarious, pampered, weak of will,--a chaos of cosmopolitan passions and intelligences. How would it be possible for a stronger race to be bred from him?--Such a race as would have a classical taste? The classical taste: this is the will to simplicity, to accentuation, and to happiness made visible, the will to the terrible, and the courage for psychological _nakedness_ (simplification is the outcome of the will to accentuate; allowing happiness as well as nakedness to become visible is a consequence of the will to the terrible ...). In order to fight one's way out of that chaos, and up to this form, a certain _disciplinary constraint_ is necessary: a man should have to choose between either going to the dogs or _prevailing._ A ruling race can only arise amid terrible and violent conditions. Problem: where are the _barbarians_ of the twentieth century? Obviously they will only show themselves and consolidate themselves after enormous socialistic crises. They will consist of those elements which are capable of the _greatest hardness towards themselves,_ and which can guarantee the _most enduring will-power._

869.

The mightiest and most dangerous passions of man, by means of which he most easily goes to rack and ruin, have been so fundamentally banned that mighty men themselves have either become impossible or else must regard themselves as _evil,_ "harmful and prohibited." The losses are heavy, but up to the present they have been necessary. Now, however, that a whole host of counter-forces has been reared, by means of the temporary suppression of these passions (the passion for dominion, the love of change and deception), their liberation has once more become possible: they will no longer possess their old savagery. We can now allow ourselves this tame sort of barbarism: look at our artists and our statesmen!

870.

The root of all evil: that the slave morality of modesty, chastity, selflessness, and absolute obedience should have triumphed. Dominating natures were thus condemned (1) to hypocrisy, (2) to qualms of conscience,--creative natures regarded themselves as rebels against God, uncertain and hemmed in by eternal values.

The barbarians showed that the ability o_f keeping within the bounds of moderation_ was not in the scope of their powers: they feared and slandered the passions and instincts of nature--likewise the aspect of the ruling Cæsars and castes. On the other hand, there arose the suspicion that all _restraint_ is a form of weakness or of incipient old age and fatigue (thus La Rochefoucauld suspects that "virtue" is only a euphemism in the mouths of those to whom vice no longer affords any pleasure). The capacity for restraint was represented as a matter of hardness, self-control, asceticism, as a fight with the devil, etc. etc. The natural _delight_ of æsthetic natures, in measure; _the pleasure derived from the beauty of measure,_ was _overlooked_ and _denied,_ because that which was desired was an anti-eudæmonistic morality. The belief in the pleasure which comes of restraint has been lacking hitherto--this pleasure of a rider on a fiery steed! The moderation of weak natures was confounded with the restraint of the strong!

In short, the best things have been blasphemed because weak or immoderate swine have thrown a bad light upon them--the best men have _remained concealed_--and have often _misunderstood_ themselves.

871.

Vicious and _unbridled people_: their depressing influence upon the _value of the pussions._ It was the appalling barbarity of morality which was principally responsible in the Middle Ages for the compulsory recourse to a veritable "league _of_ virtue"--and this was coupled with an equally appalling exaggeration of all that which constitutes the value of man. Militant "civilisation" (taming) is in need of all kinds of irons and tortures in order to maintain itself against terrible and beast-of-prey natures.

In this case, contusion, although it may have the most nefarious influences, is quite natural: that which _men of power and will are able to demand of themselves_ gives them the standard for what they may also allow themselves. Such natures are the very opposite of the _vicious_ and the _unbridled;_ although under certain circumstances they may perpetrate deeds for which an inferior man would be convicted of vice and intemperance.

In this respect the concept, "_all men are equal before God_" does an extraordinary amount of harm; actions and attitudes of mind were forbidden which belonged to the prerogative of the strong alone, just as if they were in themselves unworthy of man. All the tendencies of strong men were brought into disrepute by the fact that the defensive weapons of the most weak (even of those who were weakest towards themselves) were established as a standard of valuation.

The confusion went so far that precisely the great _virtuosos_ of life (whose self-control presents the sharpest contrast to the vicious and the unbridled) were branded with the most opprobrious names. Even to this day people feel themselves compelled to disparage a Cæsar Borgia: it is simply ludicrous. The Church has anathematised German Kaisers owing to their vices: as if a monk or a priest had the right to say a word as to what a Frederick II. should allow himself. Don Juan is sent to hell: this is very _naïf._ Has anybody ever noticed that all interesting men are lacking in heaven? ... This is only a hint to the girls, as to where they may best find salvation. If one think at all logically, and also have a profound insight into that which makes a great man, there, can be no doubt at all that the Church has dispatched all "great men" to Hades--its fight is _against_ all "greatness in man."

872.

The rights which a man arrogates to himself are relative to the duties which he sets himself, and to the tasks which he feels _capable of performing._ The great majority of men have no right to life, and are only a misfortune to their higher fellows.

873.

The misunderstanding of egoism: on the part of _ignoble natures_ who know nothing of the lust of conquest and the insatiability of great love, and who likewise know nothing of the overflowing feelings of power which make a man wish to overcome things, to force them over to himself, and to lay them on his heart, the power which impels an artist to his material. It often happens also that the active spirit looks for a field for its activity. In ordinary "egoism" it is precisely the ... "non-ego," the _profoundly mediocre creature,_ the member of the herd, who wishes to maintain himself--and when this is perceived by the rarer, more subtle, and less mediocre natures, it revolts them. For the judgment of the latter is this: "We are the _noble_! It is much more important to maintain _us_ than _that_ cattle!"

874.

The degeneration of the ruler and of the ruling classes has been the cause of all the great disorders in history! Without the Roman Cæsars and Roman society, Christianity would never have prevailed.

When it occurs to inferior men to doubt whether higher men exist, then the danger is great I It is then that men finally discover that there are virtues even among inferior, suppressed, and poor-spirited men, and that everybody is equal before God: which is the _non plus ultra_ of all confounded nonsense that has ever appeared on earth! For in the end higher men begin to measure themselves according to the standard of virtues upheld by the slaves--and discover that they are "proud," etc., and that all their _higher_ qualities should be condemned.

When Nero and Caracalla stood at the helm, it was then that the paradox arose: "The lowest man is of more value than that one on the throne!" And thus the path was prepared for an _image of God_ which was as remote as possible from the image of the mightiest,--God on the Cross!

875.

Higher man and gregarious man.--When great men are _wanting,_ the great of the past are converted into demigods or whole gods: the rise of religions proves that mankind no longer has any pleasure in man ("nor in woman neither," as in Hamlet's case). Or a host of men are brought together in a heap, and it is hoped that as a Parliament they will operate just as tyrannically.

Tyrannising is the distinctive quality of great men; they make inferior men stupid.

876.

Buckle affords the best example of the extent to which a plebeian agitator of the mob is incapable of arriving at a clear idea of the concept, "higher nature." The opinion which he _combats_ so passionately--that "great men," individuals, princes, statesmen, geniuses, warriors, are the levers and _causes_ of all great movements, is instinctively misunderstood by him, as if it meant that all that was essential and valuable in such a "higher man," was the fact that he was capable of setting masses in motion; in short, that

his sole merit was the effect he produced.... But the "higher nature" of the great man resides precisely in being different, in being unable to communicate with others, in the loftiness of his rank--_not_ in any sort of effect he may produce even though this be the shattering of both hemispheres.

877.

The Revolution made Napoleon possible: that is its justification. We ought to desire the anarchical collapse of the whole of our civilisation if such a reward were to be its result. Napoleon made nationalism possible: that is the latter's excuse.

The value of a man (apart, of course, from morality and immorality: because with these concepts a man's _worth_ is not even skimmed) does not lie in his utility; because he would continue to exist even if there were nobody to whom he could be useful. And why could not that man be the very pinnacle of manhood who was the source of the worst possible effects for his race: so high and so superior, that in his presence everything would go to rack and ruin from envy?

878.

To appraise the value of a man according to his _utility_ to mankind, or according to what he costs it, or the _damage_ he is able to inflict upon it, is just as good and just as bad as to appraise the value of a work of art according to its _effects._ But in this way the value of one man compared with another is not even touched upon. The "moral valuation," in so far as it is _social_ measures men altogether according to their effects. But what about the man who has his own taste on his tongue, who is surrounded and concealed by his isolation, uncommunicative and not to be communicated with; a man whom no one has fathomed yet--that is to say, a creature of a higher, and, at any rate, _different_ species, how would ye appraise his worth, seeing that ye cannot know him and can compare him with nothing?

Moral valuation was the cause of the most enormous obtuseness of judgment: the value of a man in himself is _underrated,_ well-nigh _overlooked,_ practically _denied._ This is the remains of simple-minded teleology: the value of man _can only be measured with regard to other men._

879.

To be obsessed by moral considerations presupposes a very low grade of intellect: it shows that the instinct for special rights, for standing apart, the feeling of freedom in creative natures, in "children of God" (or of the devil), is lacking. And irrespective of whether _he_ preaches a ruling morality or _criticises_ the prevailing ethical code from the point of view of his own ideal: by doing these things a man shows that he belongs to the herd--even though he may be what it is most in need of--that is to say, a "shepherd."

880.

We should substitute morality by the will to our own ends, and _consequently_ to the means to them.

881.

Concerning the order of rank.--What is it that constitutes the _mediocrity_ of the typical man? That he does not understand that things necessarily have _their other side;_ that he combats evil conditions as if they could be dispensed with, that he will not take the one with the other; that he would fain obliterate and erase the _specific character of a thing,_ of a circumstance, of an age, and of a person, by calling only a portion of their qualities good, and suppressing the remainder. The "desirability" of the mediocre is that which we others combat: their _ideal_ is something which shall no longer contain anything harmful, evil, dangerous, questionable, and destructive. We recognise the reverse of this: that with every growth of man his other side must grow as well; that the highest man, if such a concept be allowed, would be that man who would represent _the antagonistic character of existence_ most strikingly, and would be its glory and its only justification.... Ordinary men may only represent a small corner and nook of this natural character; they perish the moment the multifariousness of the elements composing them, and the tension between their antagonistic traits, increases: but this is the prerequisite for greatness in man. That man should become better and at the same time more evil, is my formula for this inevitable fact.

The majority of people are only piecemeal and fragmentary examples of man: only when all these creatures are jumbled together does one whole man arise Whole ages and whole peoples in this sense, have a fragmentary character about them; it may perhaps

be part of the economy of human development that man should develop himself only piecemeal. But, for this reason, one should not forget that the only important consideration is the rise of the synthetic man; that inferior men, and by far the great majority of people, are but rehearsals and exercises out of which here and there a whole man may arise; a man who is a human milestone, and who indicates how far mankind has advanced up to a certain point. Mankind does not advance in a straight line,--often a type is attained which is again lost (for instance, with all the efforts of three hundred years, we have not reached the men of the Renaissance again, and in addition to this we must not forget that the man of the Renaissance was already behind his brother of classical antiquity).

882.

The superiority of the Greek and the man of the Renaissance is recognised, but people would like to produce them without the conditions and causes of which they were the result.

883.

"Purification of taste" can only be the result of the _strengthening_ of the type. Our society to-day represents only the cultivating systems, the cultivated man is _lacking._ The great _synthetic man,_ in whom the various forces for attaining a purpose are correctly harnessed together, is altogether wanting. The specimen we possess is the _multifarious_ man, the most interesting form of chaos that has ever existed: but _not_ the chaos _preceding_ the creation of the world, but that following it: _Goethe_ as the most beautiful expression of the type (_completely and utterly un-Olympian_!)[3]

[Footnote 3: The Germans always call Goethe the Olympian.--Tr.]

884.

Handel, Leibniz, Goethe, and Bismarck, are characteristic of the _strong German type._ They lived with equanimity, surrounded by contrasts. They were full of that agile kind of strength which cautiously avoids convictions and doctrines, by using the one as a weapon against the other, and reserving absolute freedom for themselves.

885.

Of this I am convinced, that if the rise of great and rare men had been made dependent upon the voices of the multitude (taking for granted, of course, that the latter knew the qualities which belong to greatness, and also the price that all greatness pays for its self-development), then there would never have been any such thing as a great man!

The fact that things pursue their course _independently_ of the voice of the many, is the reason why, a few astonishing things have taken place on earth.

886.

The Order of Rank in Human Values.

_(a)_ A man should not be valued according to isolated acts. _Epidermal actions._ Nothing is more rare than a _personal_ act. Class, rank, race, environment, accident--all these things are much more likely to be expressed in an action or deed than the "personality" of the doer.

_(b)_ We should on no account jump to the conclusion that there are many people who are personalities. Some men are but conglomerations of personalities, whilst the majority are not even _one._ In all cases in which those average qualities preponderate, which ensure the maintenance of the species, to be a personality would involve unnecessary expense, it would be a luxury in fact, it would be foolish to demand of anybody that he should be a personality. In such circumstances everybody is a channel or a transmitting vessel.

_(c)_ A "personality" is a relatively _isolated_ phenomenon; in view of the superior importance of the continuation of the race at an average level, a personality might even be regarded as something _hostile to nature._ For a personality to be possible, timely isolation and the necessity for an existence of offence and defence, are prerequisites; something in the nature of a walled enclosure, a capacity for shutting out the world; but above all, a much _lower degree of sensitiveness_ than the average man has, who is too easily infected with the views of others.

The first _question_ concerning the _order of rank:_ how far is a man disposed to be _solitary_ or _gregarious?_ (in the latter case, his value consists in those qualities which secure the survival of his tribe or his type; in the former case, his qualities are those which distinguish him from others, which isolate and defend him, and make his _solitude possible_).

Consequence: the solitary type should not be valued from the standpoint of the gregarious type, or _vice versâ._

Viewed from above, both types are necessary; as is likewise their antagonism,--and nothing is _more_ thoroughly reprehensible than the "desire" which would develop a _third_ thing out of the two ("virtue" as hermaphroditism). This is as little worthy of desire as the equalisation and reconciliation of the sexes. The _distinguishing qualities must be developed ever more and more,_ the gulf must _be made ever wider...._

The concept of _degeneration_ in both cases: the approximation of the qualities of the herd to those of solitary creatures: and _vice versâ_--in short, when they begin to _resemble_ each other. This concept of degeneration is beyond the sphere of moral judgments.

887.

Where the _strongest natures_ are to be sought. The ruin and degeneration of the _solitary_ species is much greater and more terrible: they have the instincts of the herd, and the tradition of values, against them; their weapons of defence, their instincts of self-preservation, are from the beginning insufficiently strong and reliable--fortune must be peculiarly favourable to them if they are _to prosper_ (they prosper best in the lowest ranks and dregs of society; if ye are seeking _personalities_ it is there that ye will find them with much greater certainty than in the middle classes!)

When the dispute between ranks and classes, which aims at equality of rights, is almost settled, the fight will begin against the _solitary person._ (In a certain sense _the latter can maintain and develop himself most easily in a democratic society:_ there where the coarser means of defence are no longer necessary, and a certain habit of order, honesty, justice, trust, is already a general condition.) The _strongest_ must be most tightly bound, most strictly watched, laid in chains and supervised: this is the instinct of the herd. To them belongs a régime of self-mastery, of ascetic detachment, of "duties" consisting in exhausting work, in which one can no longer call one's soul one's own.

888.

I am attempting an _economic_ justification of virtue. The object is to make man as useful as possible, and to make him approximate as nearly as one can to an infallible machine: to this end he must be equipped with _machine-like virtues_ (he must learn to value those states in which he works in a most mechanically useful way, as the highest of all: to this end it is necessary to make him as disgusted as possible with the other states, and to represent them as very dangerous and despicable).

Here is the first stumbling-block: the tediousness and monotony which all mechanical activity brings with it. To learn to endure _this_--and not only to endure it, but to see tedium enveloped in a ray of exceeding charm: this hitherto has been the task of all higher schools. To learn something which you don't care a fig about, and to find precisely your "duty" in this "objective" activity; to learn to value happiness and duty as things apart; this is the invaluable task and performance of higher schools. It is on this account that the philologist has, hitherto, been the educator _per se:_ because his activity, in itself, affords the best pattern of magnificent monotony in action; under his banner youths learn to "swat": first prerequisite for the thorough fulfilment of mechanical duties in the future (as State officials, husbands, slaves of the desk, newspaper readers, and soldiers). Such an existence may perhaps require a philosophical glorification and justification more than any other: pleasurable feelings must be valued by some sort of infallible tribunal, as altogether of inferior rank; "duty _per se_" perhaps even the pathos of reverence in regard to everything unpleasant,--must be demanded imperatively as that which is above all useful, delightful, and practical things.... A mechanical form of existence regarded as the highest and most respectable form of existence, worshipping itself (type: Kant as the fanatic of the formal concept "Thou shalt").

889.

The economic valuation of all the ideals that have existed hitherto--that is to say, the selection and rearing of definite passions and states at the cost of other passions and states. The lawgiver (or the instinct of the community) selects a number of states and passions the existence of which guarantees the performance of regular actions (mechanical actions would thus be the result of the

regular requirements of those passions and states).

In the event of these states and passions containing ingredients which were painful, a means would have to be found for overcoming this painfulness by means of a valuation; pain would have to be interpreted as something valuable, as something pleasurable in a higher sense. Conceived in a formula: "_How does something unpleasant become pleasant?_" For instance, when our obedience and our submission to the law become honoured, thanks to the energy, power, and self-control they entail. The same holds good of our public spirit, of our neighbourliness, of our patriotism, our "humanisation," our "altruism," and our "heroism." The _object of all idealism_ should, be to induce people to do unpleasant things cheerfully.

890.

The _belittlement_ of man must be held as the chief aim for a long while: because what is needed in the first place is a broad basis from which a stronger species of man may arise (to what extent hitherto has _every stronger_ species of man arisen from a _substratum of inferior people?_).

891.

The absurd and contemptible form of idealism which would not have mediocrity mediocre, and which instead of feeling triumphant at being exceptional, becomes _indignant_ at cowardice, falseness, pettiness, and wretchedness. _We should not wish things to be any different,_ we should make the gulfs even _wider_!--The higher types among men should be compelled to distinguish themselves by means of the sacrifices which they make to their own existence.

Principal point of view; distances must be established, but _no contrasts must be created._ The _middle classes_ must be dissolved, and their influence decreased: this is the principal means of maintaining distances.

892.

Who would dare to disgust the mediocre of their mediocrity! As you observe, I do precisely the reverse: every step away from mediocrity--thus do I teach--leads to _immorality._

893.

To hate mediocrity is unworthy of a philosopher: it is almost a note of interrogation to his "_right_ to philosophy." It is precisely because he is the exception that he must protect the rule and ingratiate all mediocre people.

894.

What I combat: that an exceptional form should make war upon the rule--instead of understanding that the continued existence of the rule is the first condition of the value of the exception. For instance, there are women who, instead of considering their abnormal thirst for knowledge as a distinction, would fain dislocate the whole status of womanhood.

895.

The _increase of strength_ despite the temporary ruin of the individual:--

A new level must be established;

We must have a method of storing up forces for the maintenance of small performances, in opposition to economic waste;

Destructive nature must for once be reduced to an _instrument_ of this economy of the future;

The weak must be maintained, because there is an enormous mass of _finicking_ work to be done;

The weak and the suffering must be upheld in their belief that existence is still possible;

Solidarity must be implanted as an instinct opposed to the instinct of fear and servility;

War must be made upon accident, even upon the accident of "the great man."

896.

War upon _great_ men justified on economic grounds. Great men are dangerous; they are accidents, exceptions, tempests, which are strong enough to question things which it has taken time to build and establish. Explosive material must not only be discharged harmlessly, but, if possible, its discharge must be _prevented_ altogether, this is the fundamental instinct of all civilised society.

897.

He who thinks over the question of how the type man may be elevated to its highest glory and power, will realise from the start that he must place himself beyond morality; for morality was directed in its essentials at the opposite goal--that is to say, its aim was to arrest and to annihilate that glorious development wherever it was in process of accomplishment. For, as a matter of fact, development of that sort implies that such an enormous number of men must be subservient to it, that a _counter-movement_ is only too natural: the weaker, more delicate, more mediocre existences, find it necessary to take up sides _against_ that glory of life and power; and for that purpose they must get a new valuation of themselves by means of which they are able to condemn, and if possible to destroy, life in this high degree of plenitude. Morality is therefore essentially the expression of hostility to life, in so far as it would overcome vital types.

898.

The strong of the future.--To what extent necessity on the one hand and accident on the other have attained to conditions from which a _stronger species_ may be reared: this we are now able to understand and to bring about consciously; we can now create those conditions under which such an elevation is possible.

Hitherto education has always aimed at the utility of society: _not_ the greatest possible utility for the future, but the utility of the society actually extant. What people required were "instruments" for this purpose. Provided the _wealth of forces were greater,_ it would be possible to think of a draft being made upon them, the aim of which would not be the utility of society, but some future utility.

The more people grasped to what extent the present form of society was in such a state of transition as sooner or later to be _no longer able to exist for its own sake,_ but only as a means in the hands of a stronger race, the more _this task would have to be brought forward._

The increasing belittlement of man is precisely the impelling power which leads one to think of the cultivation of a _stronger race:_ a race which would have a surplus precisely there where the dwarfed species was weak and growing weaker (will, responsibility, self-reliance, the ability to postulate aims for one's self).

The means would be those which history teaches: _isolation_ by means of preservative interests which would be the reverse of those generally accepted; exercise in transvalued valuations; distance as pathos; a clean conscience in what to-day is most despised and most prohibited.

The _levelling_ of the mankind of Europe is the great process which should not be arrested; it should even be accelerated. The necessity of _cleaving gulfs,_ of _distance,_ of the _order of rank,_ is therefore imperative; but not the necessity of retarding the process above mentioned.

This _levelled-down_ species requires justification as soon as it is attained: its justification is that it exists for the service of a higher and sovereign race which stands upon it and can only be elevated upon its shoulders to the task which it is destined to perform. Not only a ruling race whose task would be consummated in ruling alone: but a race with _vital spheres_ of its own, with an overflow of energy for beauty, bravery, culture, and manners, even for the most abstract thought; a yea-saying race which would be able to allow itself every kind of great luxury--strong enough to be able to dispense with the tyranny of the imperatives of virtue, rich enough to be in no need of economy or pedantry; beyond good and evil; a forcing-house for rare and exceptional plants.

899.

Our psychologists, whose glance dwells involuntarily upon the symptoms of decadence, lead us to mistrust intellect ever more and more. People persist in seeing only the weakening, pampering, and sickening effects of intellect, but there are now going to appear:--

New Cynics The union of intellectual barbarians Experimentalists superiority with well-being Conquerors and an overflow of strength.

900.

I point to something new: certainly for such a democratic community there is a danger of barbarians; but these are sought only down below. There is also _another kind of barbarians_ who come from the heights: a kind of conquering and ruling natures, which are in search of material that they can mould. Prometheus was a barbarian of this stamp.

901.

Principal standpoint: one should not suppose the mission of a higher species to be the _leading_ of inferior men (as Comte does, for instance); but the inferior should be regarded as the _foundation_ upon which a higher species may live their higher life--upon which alone they _can stand._ The conditions under which a _strong, noble_ species maintains itself (in the matter of intellectual discipline) are precisely the reverse of those under which the industrial masses--the tea-grocers _à la_ Spencer--subsist. Those qualities which are within the grasp only of the _strongest_ and most _terrible_ natures, and which make their existence possible leisure, adventure, disbelief, and even dissipation--would necessarily ruin mediocre natures --and does do so--when they possess them. In the case of the latter industry, regularity, moderation, and strong "conviction" are in their proper place--in short, all "gregarious virtues": under their influence these mediocre men become perfect.

902.

Concerning the ruling types. The shepherd as opposed to the "lord" (the former is only a means to the maintenance of the herd; the latter, the _purpose_ for which the herd exists).

903.

The temporary preponderance of social valuations is both comprehensible and useful; it is a matter of building a _foundation_ upon which a _stronger_ species will ultimately be made possible. The standard of strength: to be able to live under the transvalued valuations, and to desire them for all eternity. State and society regarded as a sub-structure: economic point of view, education conceived as breeding.

904.

A consideration which "free spirits" _lack_: that the same discipline which makes a strong nature still stronger, and enables it to go in for big undertakings, _breaks up and withers the mediocre_: doubt --_la largeur de cœur_--experiment--independence.

905.

The hammer. How should men who must value in the opposite way be constituted?--Men who possess _all_ the qualities of the modern soul, but are strong enough to convert them into real health? The means to their task.

906.

The strong man, who is mighty in the instincts of a strong and healthy organisation, digests his deeds just as well as he digests his meals; he even gets over the effects of heavy fare: in the main, however, he is led by an inviolable and severe instinct which prevents his doing anything which goes against his grain, just as he never does anything against his taste.

907.

Can we _foresee_ the favourable circumstances under which creatures of the highest value might arise? It is a thousand times too complicated, and the probabilities of failure are _very great:_ on that account we cannot be inspired by the thought of striving after them! Scepticism.--To oppose this we can enhance courage, insight, hardness, independence, and the feeling of responsibility; we can also subtilise and learn to forestall the delicacy of the scales, so that favourable accidents may be enlisted on our side.

908.

Before we can even think of acting, an enormous amount of work requires to be done. In the main, however, _a cautious exploitation_ of the present conditions would be our best and most advisable course of action. The actual _creation_ of conditions such as those which occur by accident, presupposes the existence of _iron_ men such as have not yet lived. Our first task must be to make the personal ideal _prevail_ and _become realised_! He who has understood the nature of man and _the origin of mankind's greatest specimens, shudders before man and takes flight from all action_: this is the result of inherited valuations!!

My consolation is, that the nature of man is _evil,_ and this guarantees his _strength_!

909.

The typical forms of self-development, or the eight principal questions:--

1. Do we want to be more multifarious or more simple than we are?

2. Do we want to be happier than we are, or more indifferent to both happiness and unhappiness?

3. Do we want to be more satisfied with ourselves, or more exacting and more inexorable?

4. Do we want to be softer, more yielding, and more human than we are, or more inhuman?

5. Do we want to be more prudent than we are, or more daring?

6. Do we want to attain a goal, or do we want to avoid all goals (like the philosopher, for instance, who scents a boundary, a _cul-de-sac,_ a prison, a piece of foolishness in every goal)?

7. Do we want to become more respected, or more feared, or more _despised_?

8. Do we want to become tyrants, and seducers, or do we want to become shepherds and gregarious animals?

910.

The type of my disciples.--To such men as _concern vie in any way_ I wish suffering, desolation, sickness, ill-treatment, indignities of all kinds. I wish them to be acquainted with profound self-contempt, with the martyrdom of self-distrust, with the misery of the defeated: I have no pity for them; because I wish them to have the only thing which to-day proves whether a man has any value or not, namely, _the capacity of sticking to his guns._

911.

The happiness and self-contentedness of the lazzaroni, or the blessedness of "beautiful souls," or the consumptive love of Puritan pietists, proves nothing in regard to _the order of rank_ among men. As a great educator one ought inexorably to thrash a race of such blissful creatures into unhappiness. The danger of belittlement and of a slackening of powers follows immediately I am _opposed_ to happiness _à la_ Spinoza or _à la_ Epicurus, and to all the relaxation of contemplative states. But when virtue is the means to such happiness, well then, _one must master even virtue._

912.

I cannot see how any one can make up for having missed going to _a good school_ at the proper time. Such a person does not know himself; he walks through life without ever having learned to walk. His soft muscles betray themselves at every step. Occasionally life itself is merciful enough to make a man recover this lost and severe schooling: by means of periods of sickness, perhaps, which exact the utmost will-power and self-control; or by means of a sudden state of poverty, which threatens his wife and child, and which may force a man to such activity as will restore energy to his slackened tendons, and a _tough spirit_ to his will to life. The most desirable thing of all, however, is, under all circumstances to have severe discipline _at the right time, i.e._ at that age when it makes us proud that people should expect great things from us. For this is what distinguishes hard schooling, as good schooling, from every other schooling, namely, that a good deal is demanded, that a good deal is severely exacted; that goodness, nay even excellence itself, is required as if it were normal; that praise is scanty, that leniency is non-existent; that blame is sharp, practical, and without reprieve, and has no regard to talent and antecedents. We are in every way in need of such a school: and this holds good of corporeal as well as of spiritual things; it would be fatal to draw distinctions here! The same discipline makes the soldier and the scholar efficient; and, looked at more closely, there is no true scholar who has not the instincts of a true soldier in

his veins. To be able to command and to be able to obey in a proud fashion; to keep one's place in rank and file, and yet to be ready at any moment to lead; to prefer danger to comfort; not to weigh what is permitted and what is forbidden in a tradesman's balance; to be more hostile to pettiness, slyness, and parasitism than to wickedness. What is it that one _learns_ in a hard school?--_to obey_ and _to command._

913.

We should _repudiate_ merit--and do only that which stands above all praise and above all understanding.

914.

The new forms of morality:--

Faithful vows concerning that which one wishes to do or to leave undone; complete and definite abstention from many things. Tests as to whether one is _ripe_ for such discipline.

915.

It is my desire to _naturalise asceticism:_ I would substitute the old intention of asceticism, "self-denial," by my own intention, _self-strengthening:_ a gymnastic of the will; a period of abstinence and occasional fasting of every kind, even in things intellectual; a casuistry in deeds, in regard to the opinions which we derive from our powers; we should try our hand at adventure and at deliberate dangers. (_Dîners chez Magny:_ all intellectual gourmets with spoilt stomachs.) _Tests_ ought also to be devised for discovering a man's power in keeping his word.

916.

The things which have become _spoilt_ through having been abused by the Church:--

(1) _Asceticism._--People have scarcely got the courage yet to bring to light the natural utility and necessity of asceticism for the purpose of the _education of the will._ Our ridiculous world of education, before whose eyes the useful State official hovers as an ideal to be striven for, believes that it has completed its duty when it has instructed or trained the brain; it never even suspects that something else is first of all necessary --the education of _will-power;_ tests are devised for everything except for the most important thing of all: whether a man can _will,_ whether he can _promise;_ the young man completes his education without a question or an inquiry having been made concerning the problem of the highest value of his nature.

(2) _Fasting:_--In every sense--even as a means of maintaining the capacity for taking pleasure in all good things (for instance, to give up reading for a while, to hear no music for a while, to cease from being amiable for a while: one ought also to have fast days for one's virtues).

(3) _The monastery._--Temporary isolation with severe seclusion from all letters, for instance; a kind of profound introspection and self-recovery, which does not go out of the way of "temptations," but out of the way of "duties"; a stepping out of the daily round of one's environment; a detachment from the tyranny of stimuli and external influences, which condemns us to expend our power only in reactions, and does not allow it to gather volume until it bursts into spontaneous activity (let anybody examine our scholars closely: they only think reflexively, _i.e._ they must first read before they can think).

(4) _Feasts._--A man must be very coarse in order not to feel the presence of Christians and Christian values as oppressive, so oppressive as to send all festive moods to the devil. By feasts we understand: pride, high-spirits, exuberance; scorn of all kinds of seriousness and Philistinism; a divine saying of Yea to one's self, as the result of physical plenitude and perfection--all states to which the Christian cannot honestly say Yea. _A feast is a pagan thing par excellence._

(5) The _courage of ones own nature: dressing-up in morality,_--To be able to call one's passions good without the help of a moral formula: this is the standard which measures the extent to which a man is able to say Yea to his own nature, namely, how much or how little he has to have recourse to morality.

(6) _Death._--The foolish physiological fact must be converted into a moral necessity. One should live in such a way that _one may have the will to die at the right time_!

917.

To feel ones self stronger or, expressed otherwise: happiness always presupposes a comparison (not necessarily with others, but with one's self, in the midst of a state of growth, and without being conscious that one is comparing).

Artificial accentuation: whether by means of exciting chemicals or exciting errors ("hallucinations.")

Take, for instance, the Christian's feeling of _security_; he feels himself strong in his confidence, in his patience, and his resignation: this artificial accentuation he owes to the fancy that he is protected by a God. Take the feeling of _superiority,_ for instance: as when the Caliph of Morocco sees only globes on which his three united kingdoms cover four-fifths of the space. Take the feeling of _uniqueness,_ for instance: as when the European imagines that culture belongs to Europe alone, and when he regards himself as a sort of abridged cosmic process; or, as when the Christian makes all existence revolve round the "Salvation of man."

The question is, where does one begin to feel the pressure of constraint: it is thus that different degrees are ascertained. A philosopher for instance, in the midst of the coolest and most transmontane feats of abstraction feels like a fish that enters its element: while colours and tones oppress him; not to speak of those dumb desires--of that which others call "the ideal."

918.

A healthy and vigorous little boy will look up sarcastically if he be asked: "Wilt thou become virtuous?"--but he immediately becomes eager if he be asked: "Wilt thou become stronger than thy comrades?"

***

How does one become stronger?--By deciding slowly; and by holding firmly to the decision once it is made. Everything else follows of itself. Spontaneous and changeable natures: both species of the weak. We must not confound ourselves with them; we must feel distance--betimes!

Beware of good-natured people!. Dealings with them make one torpid. All environment is good which makes one exercise those defensive and; aggressive powers which are instinctive in man. All one's inventiveness should apply itself to putting one's power of will to the test.... _Here_ the determining factor must be recognised as something which is not knowledge, astuteness, or wit.

One must learn to command betimes,--likewise to obey. A man must learn modesty and tact in modesty: he must learn to distinguish and to honour where modesty is displayed; he must likewise distinguish and honour wherever he bestows his confidence.

What does one repent most? One's modesty; the fact that one has not lent an ear to one's most individual needs; the fact that one has mistaken one's self; the fact that one has esteemed one's self low; the fact that one has lost all delicacy of hearing in regard to one's instincts.--This want of reverence in regard to one's self is avenged by all sorts of losses: in health, friendship, well-being, pride, cheerfulness, freedom, determination, courage. A man never forgives himself, later on, for this want of genuine egoism: he regards it as an objection and as a cause of doubt concerning his real ego.

919.

I should like man to begin by _respecting_ himself: everything else follows of itself. Naturally a man ceases from being anything to others in this way: for this is precisely what they are least likely to forgive. "What? a man who respects himself?"[4] This is something quite different from the blind instinct to _love_ one's self. Nothing is more common in the love of the sexes or in that duality which is called ego, than a certain contempt for that which is loved the fatalism of love.

[Footnote 4: Cf. Disraeli in _Tancred:_ "Self-respect, too, is a superstition of past ages.... It is not suited to these times; it is much too arrogant, too self-conceited, too egoistical. No one is important enough to have self-respect nowadays" (book iii. chap. v.).--Tr.]

920.

"I will have this or that"; "I would that this or that were so"; "I know that this or that is so the degrees of power: the man of _will,_ the man of _desire,_ the man of _fate._

921.

The means by which a strong species maintains itself:--

It grants itself the right of exceptional actions, as a test of the power of self-control and of freedom.

It abandons itself to states in which a man is not allowed to be anything else than a barbarian.

It tries to acquire strength of will by every kind of asceticism.

It is not expansive, it practises silence; it is cautious in regard to all charms.

It learns to obey in such a way that obedience provides a test of self-maintenance. Casuistry is carried to its highest pitch in regard to points of honour.

It never argues, "What is sauce for the goose is sauce for the gander,"--but conversely! it regards reward, and the ability to repay, as a privilege, as a distinction.

It does not covet _other_ people's virtues.

922.

The way in which one has to treat raw savages and the impossibility of dispensing with barbarous methods, becomes obvious, in practice, when one is transplanted, with all one's European pampering, to a spot such as the Congo, or anywhere else where it is necessary to maintain one's mastery over barbarians.

923.

Warlike and peaceful people.--Art thou a man who has the instincts of a warrior in thy blood? If this be so, another question must be put. Do thy instincts impel thee to attack or to defend? The rest of mankind, all those whose instincts are not warlike, desire peace, concord, freedom, "equal rights": these things are but names and steps for one and the same thing. Such men only wish to go where it is not necessary for them to defend themselves,--such men become discontented with themselves when they are obliged to offer resistance: they would fain create circumstances in which war is no longer necessary. If the worst came to the worst, they would resign themselves, obey, and submit: all these things are better than waging war--thus does the Christian's instinct, for instance, whisper to him. In the born warrior's character there is something of armour, likewise in the choice of his circumstances and in the development of every one of his qualities, weapons are best evolved by the latter type, shields are best devised by the former.

What expedients and what virtues do the unarmed and the undefended require in order to survive--and even to conquer?

924.

What will become of a man who no longer has any reasons for either defence or attack? What will remain of his _passions_ when he has lost those which form his defence and his weapons?

925.

A marginal note to a _niaiserie anglaise_: "Do not to others that which you would not that they should do unto you." This stands for wisdom; this stands for prudence; this stands as the very basis of morality as "a golden maxim." John Stuart Mill believes in it (and what Englishman does not?).... But the maxim does not bear investigation. The argument, Do not as you would not be done by, forbids action which produce harmful results; the thought behind always is that an action is invariably requited. What if some one came forward with the _"Principe"_ in his hands, and said: "We must do those actions alone which enable us to steal a march on others,--and which deprive others of the power of doing the same to us"?--On the other hand, let us remember the Corsican who pledges his honour to vendetta. He too does not desire to have a bullet through him; but the prospect of one, the probability of getting one, does not deter him from vindicating his honour.... And in all really decent actions are we not intentionally indifferent as to what result they will bring? To avoid an action which might have harmful results,--that would be tantamount to forbidding all decent actions in general.

Apart from this, the above maxim is valuable because it betrays a certain _type of man_: it is the instinct of the herd which formulates itself through him,--we are equal, we regard each other as equal: as I am to thee so art thou to me.--In this community equivalence of actions is really believed in--an equivalence which never under any circumstances manifests itself in real conditions. It is impossible to requite every action: among real individuals equal actions do not exist, consequently there can be no such thing as "requital." ... When I do anything, I am very far from thinking that any man is able to do anything at all like it: the action belongs to me.... Nobody can pay me back for anything I do; the most that can be done is to make me the victim of another action.

926.

Against John Stuart Mill.--I abhor the man's vulgarity when he says: "What is right for one man is right for another"; "Do not to others that which you would not that they should do unto you. Such principles would fain establish the whole of human traffic _upon mutual services,_ so that every action would appear to be a cash payment for something done to us. The hypothesis here is ignoble to the last degree: it is taken for granted that there is some sort of equivalence in value between my actions and thine; the most personal value Of an action is simply cancelled in this manner (that part of an action which has no equivalent and which cannot be remunerated). "Reciprocity" is a piece of egregious vulgarity; the mere fact that what I do _cannot_ and _may_ not be done by another, that there is _no such thing as equivalence_ (except in those _very select circles_ where one actually has one's equal, _inter pares_), that in a really profound sense a man never requites because he is something _unique_ in himself and can only do _unique_ things,--this fundamental conviction contains the cause of _aristocratic aloofness from the mob_, because the latter believes in equality, and _consequently_ in the feasibility of equivalence and "reciprocity."

927.

The suburban Philistinism of moral valuations and of its concepts "useful" and "harmful" is well founded; it is the necessary point of view of a community which is only able to see and survey _immediate and proximate_ consequences. The _State_ and the _political man_ are already in need of a more _super-moral_ attitude of mind: because they have to calculate concerning a much more complicated tissue of consequences. An economic policy for the whole world should be possible which could look at things in such broad perspective that all its isolated demands would seem for the moment not only unjust, but arbitrary.

928.

"_Should one follow one's feelings?_"--To set one's life at stake on the impulse of the moment, and actuated by a generous feeling, has little worth, and does not even distinguish one. Everybody is alike in being capable of this--and in behaving in this way with determination, the criminal, the bandit, and the Corsican certainly outstrip the honest man.

A higher degree of excellence would be to overcome this impulse, and to refrain from performing an heroic deed at its bidding--and to remain cold, _raisonnable_, free from the tempestuous surging of concomitant sensations of delight.... The same holds good of pity: it must first be _sifted through_ reason; without this it becomes just as dangerous as any other passion.

The _blind yielding_ to a passion, whether it be generosity, pity, or hostility, is the cause of the greatest evil. Greatness of character does not consist in not possessing these passions--on the contrary, a man should possess them to a terrible degree: but he should lead them by the bridle.. and even this he should not do out of love of control, but merely because....

929.

"To give up one's life for a cause"--very effective. But there are many things for which one gives up one's life: the passions, one and all, will be gratified. Whether one's life be pledged to pity, to anger, or to revenge--it matters not from the point of view of value. How many have not sacrificed their lives for pretty girls--and even what is worse, their health! When one has temperament, one instinctively chooses the most dangerous things: if one is a philosopher, for instance, one chooses the adventures of speculation; if one is virtuous, one chooses immorality. One kind of man will risk nothing, another kind will risk everything. Are we despisers of life? On the contrary, what we seek is life raised to a higher power, life in danger.... But, let me repeat, we do not, on that account, wish to be more virtuous than others, Pascal, for instance, wished to risk nothing, and remained a Christian. That perhaps was virtuous.----A man always sacrifices something.

930.

How many _advantages_ does not a man sacrifice! To how small an extent does he seek his own profit! All his emotions and passions wish to assert their rights, and how remote a passion is From that cautious utility which consists in personal profit!

A man does _not_ strive after "happiness"; one must be an Englishman to be able to believe that a man is always seeking his own advantage. Our desires long to violate things with passion--their overflowing strength seeks obstacles.

931.

All passions are generally _useful,_ some directly, others indirectly; in regard to utility it is absolutely impossible to fix upon any gradation of values,--however certainly the forces of nature in general may be regarded as good (_i.e._ useful), from an economic point of view, they are still the sources of much that is terrible and much that is fatally irrevocable. The most one might say would be, that the mightiest passions are the most valuable: seeing that no stronger sources of power exist.

932.

All well-meaning, helpful, good-natured attitudes of mind have _not_ come to be honoured on account of their usefulness: but because they are the conditions peculiar to _rich souls_ who are able to bestow and whose value consists in their vital exuberance. Look into the eyes of the benevolent man! In them you will see the exact reverse of self-denial, of hatred of self, of Pascalism.

933.

In short, what we require is to dominate the passions and not to weaken or to extirpate them!--The greater the dominating power of the will, the greater the freedom that may be given to the passions.

The "great man" is so, owing to the free scope which he gives to his desires, and to the still greater power which knows how to enlist these magnificent monsters into its service.

The "good man" in every stage of civilisation is at one and the same time the _least dangerous_ and the _most useful:_ a sort of medium; the idea formed of such a man by the common mind is that he is some one _whom one has no reason to fear, but whom one must not therefore despise._

Education: essentially a means of _ruining_ exceptions in favour of the rule. Culture: essentially the means of directing taste against the exceptions in favour of the mediocre.

Only when a culture can dispose of an overflow of force, is it capable of being a hothouse for the luxurious culture of the exception, of the experiment, of the danger, of the _nuance: this_ is the tendency of _every_ aristocratic culture.

934.

All questions of strength: to what extent ought one to try and prevail against the preservative measures of society and the latter's prejudices?--to what extent ought one to unfetter _one's terrible qualities,_ through which so many go to the dogs?--to what extent ought one to run counter to _truth,_ and take up sides with its most questionable aspects?--to what extent ought one to oppose suffering, self-contempt, pity, disease, vice, when it is always open to question whether one can ever master them (what does not kill us makes us _stronger..._.)?--and, finally, to what extent ought one to acknowledge the rights of the rule, of the common-place, of the petty, of the good, of the upright, in fact of the average man, without thereby allowing one's self to become vulgar? ... The strongest test of character is to resist being ruined by the seductiveness of goodness. _Goodness_ must be regarded as a luxury, as a refinement, as a _vice._

3. The Noble Man.

935.

Type. real goodness, nobility, greatness of soul, as the result of vital wealth: which does not give in order to receive--and which has no desire to _elevate_ itself by being good, _squandering_ is typical of genuine goodness, vital _personal_ wealth is its prerequisite.

936.

Aristocracy.--Gregarious ideals at present culminating in the highest standard of value for society. It has been attempted to give them a cosmic, yea, and even a metaphysical, value.--I defend _aristocracy_ against them.

Any society which would of itself preserve a feeling of respect and _délicatesse_ in regard to freedom, must consider itself as an exception, and have a force against it from which it distinguishes itself, and upon which it looks down with hostility.

The more rights I surrender and the more I level myself down to others, the more deeply do I sink into the average and ultimately into the greatest number. The first condition which an aristocratic society must have in order to maintain a high degree of freedom among its members, is that extreme tension which arises from the presence of the most _antagonistic_ instincts in all its units: from their will to dominate....

If ye would fain do away with strong contrasts and differences of rank, ye will also abolish, strong love, lofty attitudes of mind, and the feeling of individuality.

***

Concerning the _actual_ psychology of societies based upon freedom and equality.--What is it that tends to _diminish_ in such a society?

The will to be _responsible for ones self_ (the loss of this is a sign of the decline of autonomy); the ability to defend and to attack, even in spiritual matters; the power of command; the sense of reverence, of subservience, the ability to be silent, _great passion,_ great achievements, tragedy and cheerfulness.

937.

In 1814 Augustin Thierry read what Montlosier had said in his work, _De la Monarchie française:_ he answered with a cry of indignation, and set himself to his task. That emigrant had said:

"_Race d'affranchis, race d'esclaves arrachés de nos mains, peuple tributaire, peuple nouveau, licence vous fut octroyée d'être libres, et non pas à nous d'être nobles; pour nous tout est de droit, pour vous tout est de grâce, nous ne sommes point de votre communauté; nous sommes un tout par nous mêmes._"

938.

How constantly the aristocratic world shears and weakens itself ever more and more! By means of its noble instincts it abandons its privileges, and owing to its refined and excessive culture, it takes an interest in the people, the weak, the poor, and the poetry of the lowly, etc.

939.

There is such a thing as a noble and dangerous form of carelessness, which allows of profound conclusions and insight: the carelessness of the self-reliant and over-rich soul, which has never _troubled_ itself about friends, but which knows only hospitality and knows how to practise it; whose heart and house are open to all who will enter--beggar, cripple, or king. This is genuine sociability: he who is capable of it has hundreds of "friends," but probably not one friend.

940.

The teaching μηδ■ν ■γαν applies to men with overflowing strength,--not to the mediocre, ■γκρ■τεια and ■σκησις are only steps to higher things. Above them stands "golden Nature."

"Thou shalt"--unconditional obedience in Stoics, in Christian and Arabian Orders, in Kant's philosophy (it is immaterial whether this obedience is shown to a superior or to a concept).

Higher than "Thou shalt" stands "I will" (the heroes); higher than "I will" stands "I am" (the gods of the Greeks).

Barbarian gods express nothing of the pleasure of restraint,--they are neither simple, nor light-hearted, nor moderate.

941.

The essence of our gardens and palaces (and to the same extent the essence of all yearning after riches) is _the desire to rid the eye of disorder and vulgarity, and to build a home for our soul's nobility._

The majority of people certainly believe that they will develop higher natures when those beautiful and peaceful things have operated upon them: hence the exodus to Italy, hence all travelling, etc., and all reading and visits to theatres. _People want to be formed_--that is the kernel of their labours for culture! But the strong, the mighty, would themselves _have a hand in the forming, and would fain have nothing strange about them_!

It is for this reason, too, that men go to open Nature, not to find themselves, but to lose themselves and to forget themselves. The desire "_to get away from one's self_" is proper to all weaklings, and to all those who are discontented with themselves.

942.

The only nobility is that of birth and blood. (I do not refer here to the prefix "Lord" and _L'almanac de Gotha_: this is a parenthesis for donkeys.) Wherever people speak of the "aristocracy of intellect," reasons are generally not lacking for concealing something, it is known to be a password among ambitious Jews. Intellect alone does not ennoble; on the contrary, something is always needed _to ennoble intellect._--What then is needed?--Blood.

943.

What is noble?

--External punctiliousness; because this punctiliousness hedges a man about, keeps him at a distance, saves him from being confounded with somebody else.

A frivolous appearance in word, clothing, and bearing, with which stoical hardness and self-control protect themselves from all prying inquisitiveness or curiosity.

--A slow step and a slow glance. There are not too many valuable things on earth: and these come and wish to come of themselves to him who has value. We are not quick to admire.

--We know how to bear poverty, want, and even illness.

--We avoid small honours owing to our mistrust of all who are over-ready to praise: for the man who praises believes he understands what he praises: but to understand--Balzac, that typical man of ambition, betrayed the fact _comprendre c'est égaler._

--Our doubt concerning the communicativeness of our hearts goes very deep; to us, loneliness is not a matter of choice, it is imposed upon us.

--We are convinced that we only have duties to our equals, to others we do as we think best: we know that justice is only to be expected among equals (alas! this will not be realised for some time to come),

--We are ironical towards the "gifted"; we hold the belief that no morality is possible without good birth.

--We always feel as if we were those who had to dispense honours: while he is not found too frequently who would be worthy of honouring us.

--We are always disguised: the higher a man's nature the more is he in need of remaining incognito. If there be a God, then out of sheer decency He ought only to show Himself on earth in the form of a man.

--We are capable of _otium,_ of the unconditional conviction that although a handicraft does not shame one in any sense, it certainly reduces one's rank. However much we may respect "industry," and know how to give it its due, we do not appreciate it in a bourgeois sense, or after the manner of those insatiable and cackling artists who, like hens, cackle and lay eggs, and cackle again.

--We protect artists and poets and any one who happens to be a master in something; but as creatures of a higher order than those, who only know how to do something, who are only "productive men," we do not confound ourselves with them.

--We find joy in all _forms_ and ceremonies; we would fain foster everything formal, and we are convinced that courtesy is one of the greatest virtues; we feel suspicious of every kind of _laisser aller,_ including the freedom of the press and of thought; because, under such conditions, the intellect grows easy-going and coarse, and stretches its limbs.

--We take pleasure in women as in a perhaps daintier, more delicate, and more ethereal kind of creature. What a treat it is to meet creatures who have only dancing and nonsense and finery in their minds! They have always been the delight of every tense and profound male soul, whose life is burdened with heavy responsibilities.

--We take pleasure in princes and in priests, because in big things, as in small, they actually uphold the belief in the difference of human values, even in the estimation of the past, and at least symbolically.

--We are able to keep silence _i_ but we do not breathe a word of this in the presence of listeners.

--We are able to endure long enmities: we lack the power of easy reconciliations.

--We have a loathing of demagogism, of enlightenment, of amiability, and plebeian familiarity.

--We collect precious things, the needs of higher and fastidious souls; we wish to possess nothing in common. We want to have our own books, our _own_ landscapes.

--We protest against evil and fine experiences, and take care not to generalise too quickly. The individual case: how ironically we regard it when it has the bad taste to put on the airs of a rule!

--We love that which is _naïf,_ and _naïf_ people, but as spectators and higher creatures; we think Faust is just as simple as his Margaret.

--We have a low estimation of good people, because they are gregarious animals: we know how often an invaluable golden drop of goodness lies concealed beneath the most evil, the most malicious, and the hardest exterior, and that this single grain outweighs all the mere goody-goodiness of milk-and-watery souls.

--We don't regard a man of our kind as refuted by his vices, nor by his tomfooleries. We are well aware that we are not recognised with ease, and that we have every reason to make our foreground very prominent.

944.

What is noble?--The fact that one is constantly forced to be playing a part. That one is constantly searching for situations in which one is forced to put on airs. That one leaves happiness to the _greatest number:_ the happiness which consists of inner peacefulness, of virtue, of comfort, and of Anglo-angelic-back-parlour-smugness, _à la_ Spencer. That one instinctively seeks for heavy responsibilities. That one knows how to create enemies everywhere, at a pinch even in one's self. That one contradicts the _greatest number,_ not in words at all, but by continually behaving differently from them.

945.

Virtue (for instance, truthfulness) is _our_ most noble and most dangerous luxury. We must not decline the disadvantages which it brings in its train.

946.

We refuse to be _praised:_ we do what serves our purpose, what gives us pleasure, or what we are obliged to do.

947.

What is chastity in a man? It means that his taste in sex has remained noble; that _in eroticis_ he likes neither the brutal, the morbid, nor the clever.

948.

The concept of honour is founded upon the belief in select society, in knightly excellences, in the obligation of having continually to play a part. In essentials it means that one does not take one's life too seriously, that one adheres unconditionally to the most dignified manners in one's dealings with everybody (at least in so far as they do not belong to "us"); that one is neither familiar, nor good-natured, nor hearty, nor modest, except _inter pares_; that one is _always playing a part._

949.

The fact that one sets one's life, one's health, and one's honour at stake, is the result of high spirits and of an overflowing and spendthrift will: it is not the result of philanthropy, but of the fact that every danger kindles our curiosity concerning the measure of our strength, and provokes our courage.

950.

Eagles swoop down straight nobility of soul is best revealed by the magnificent and proud foolishness with which it makes its _attacks._

951.

War should be made against all namby-pamby ideas of _nobility_!--A certain modicum of brutality cannot be dispensed with: no more than we can do without a certain approximation to criminality. "Self-satisfaction" must _not_ be allowed; a man should look upon himself with an adventurous spirit; he should experiment with himself and run risks with himself--no beautiful soul-quackery should be tolerated. I want to give _a more robust ideal_ a chance of prevailing.

952.

"Paradise is under the shadow of a swordsman"--this is also a symbol and a test-word by which souls with noble and warrior-like origin betray and discover themselves.

953.

The two paths.--There comes a period when man has a surplus amount of power at his disposal. Science aims at establishing the _slavery of nature._

Then man acquires the _leisure_ in which to develop himself into something new and more lofty. _A new aristocracy._ It is then that a large number of virtues which are now _conditions of existence_ are superseded.--Qualities which are no longer needed are on that account lost. We no longer need virtues: _consequently_ we are losing them (likewise the morality of "one thing is needful," of the salvation of the soul, and of immortality: these were means wherewith to make man capable of enormous self-tyranny, through the emotion of great fear!!!).

The different kinds of needs by means of whose discipline man is formed: need teaches work, thought, and self-control.

***

Physiological purification and strengthening. The new aristocracy is in need of an opposing body which it may combat: it must be driven to extremities in order to maintain itself.

The two futures of mankind: (1) the consequence of a levelling-down to mediocrity, (2) conscious aloofness and self-development.

A doctrine which would cleave a _gulf:_ it maintains the _highest and the lowest species_ (it destroys the intermediate).

The aristocracies, both spiritual and temporal, which have existed hitherto prove nothing _against_ the necessity of a new aristocracy.

4. The Lords of the Earth.

954.

A certain question constantly recurs to us; it is perhaps a seductive and evil question; may it be whispered into the ears of those who have a right to such doubtful problems--those strong souls of to-day whose dominion over themselves is unswerving: is it not high time, now that the type "gregarious animal" is developing ever more and more in Europe, to set about rearing, thoroughly, artificially, and consciously, an opposite type, and to attempt to establish the latter's virtues? And would not the democratic movement itself find for the first time a sort of goal, salvation, and justification, if some one appeared who availed himself of it--so that at last, beside its new and sublime product, slavery (for this must be the end of European democracy), that higher species of ruling and Cæsarian spirits might also be produced, which would stand upon it, hold to it, and would elevate themselves through it?

This new race would climb aloft to new and hitherto impossible things, to a broader vision, and to its task on earth.

955.

The aspect of the European of to-day makes me very hopeful. A daring and ruling race is here building itself up upon the foundation of an extremely intelligent, gregarious mass. It is obvious that the educational movements for the latter are not alone prominent nowadays.

956.

The same conditions which go to develop the gregarious animal also force the development of the leaders.

957.

The question, and at the same time the task, is approaching with hesitation, terrible as Fate, but nevertheless inevitable: how shall the earth as a whole be ruled? And to what end shall man as a whole--no longer as a people or as a race--be reared and trained?

Legislative moralities are the principal means by which one can form mankind, according to the fancy of a creative and profound will: provided, of course, that such an artistic will of the first order gets the power into its own hands, and can make its creative will prevail over long periods in the form of legislation, religions, and morals. At present, and probably for some time to come, one will seek such colossally creative men, such really great men, as I understand them, in vain: they will be lacking, until, after many disappointments, we are forced to begin to understand why it is they are lacking, and that nothing bars with greater hostility their rise and development, at present and for some time to come, than that which is now called _the_ morality in Europe. Just as if there were no other kind of morality, and could be no other kind, than the one we have already characterised as herd-morality. It is this morality which is now striving with all its power to attain to that green-meadow happiness on earth, which consists in security, absence of danger, ease, facilities for livelihood, and, last but not least, "if all goes well," even hopes to dispense with all kinds of shepherds and bell-wethers. The two doctrines which it preaches most universally are "equality of rights" and "pity for all sufferers"--and it even regards suffering itself as something which must be got rid of absolutely. That such ideas may be modern leads one to think very poorly of modernity. He, however, who has reflected deeply concerning the question, how and where the plant man has hitherto grown most vigorously, is forced to believe that this has always taken place under the opposite conditions; that to this end the danger of the situation has to increase enormously, his inventive faculty and dissembling powers have to fight their way up under long oppression and compulsion, and his will to life has to be increased to the unconditioned will to power, to over-power: he believes that danger, severity, violence, peril in the street and in the heart, inequality of rights, secrecy, stoicism, seductive art, and devilry of every kind--in short, the opposite of all gregarious desiderata--are necessary for the elevation of man. Such a morality with opposite designs, which would rear man upwards instead of to comfort and mediocrity; such a morality, with the intention of producing a ruling caste--the future lords of the earth--must, in order to be taught at all, introduce itself as if it were in some way correlated to the prevailing moral law, and must come forward under the cover of the latter's words and forms. But seeing that, to this end, a host of transitionary and deceptive measures must be discovered, and that the life of a single individual stands for almost nothing in view of the accomplishment of such lengthy tasks and aims, the first thing that must be done is to rear _a new kind_ of man in whom the duration of the necessary will and the necessary instincts is guaranteed for many generations. This must be a new kind of ruling species and caste--this ought to be quite as clear as the somewhat lengthy and not easily expressed consequences of this thought. The aim should be to prepare a _transvaluation of values_ for a particularly strong kind of man, most highly gifted in intellect and will, and, to this end, slowly and cautiously to liberate in him a whole host of slandered instincts hitherto held in check: whoever meditates about this problem belongs to us, the free spirits--certainly not to that kind of "free spirit" which has existed hitherto: for these desired practically the reverse. To this order, it seems to me, belong, above all, the pessimists of Europe, the poets and thinkers of a revolted idealism, in so far as their discontent with existence in general must _consistently_ at least have led them to be dissatisfied with the man of the present; the same applies to certain insatiably ambitious artists who courageously and unconditionally fight against the gregarious animal for the special rights of higher men, and subdue all herd-instincts and precautions of more exceptional minds by their seductive art. Thirdly and lastly, we should include in this group all those critics and historians by whom the discovery of the Old World, which has begun so happily--this was the work of the _new_ Columbus, of German intellect--will be courageously _continued_ (for we still stand in the very first stages of this conquest). For in the Old World, as a matter of fact, a different and more lordly morality ruled than that of to-day; and the man of antiquity, under the educational ban of his morality, was a stronger and deeper man than the man of to-day--up to the present he has been the only well-constituted man. The temptation, however, which from antiquity to the present day has always exercised its power on such

lucky strokes of Nature, _i.e._ on strong and enterprising souls, is, even at the present day, the most subtle and most effective of anti-democratic and anti-Christian powers, just as it was in the time of the Renaissance.

958.

I am writing for a race of men which does not yet exist: for "the lords of the earth."

In Plato's _Theages_ the following passage will be found: "Every one of us would like if possible to be master of mankind; if possible, a _God!" This_ attitude of mind must be reinstated in our midst.

Englishmen, Americans, and Russians.

959.

That primeval forest-plant Man always appears where the struggle for power has been waged longest. _Great_ men.

Primeval forest creatures, the _Romans._

960.

From now henceforward there will be such favourable first conditions for greater ruling powers as have never yet been found on earth. And this is by no means the most important point. The establishment has been made possible of international race unions which will set themselves the task of rearing a ruling race, the future "lords of the earth"--a new, vast aristocracy based upon the most severe self-discipline, in which the will of philosophical men of power and artist-tyrants will be stamped upon thousands of years: a higher species of men which, thanks to their preponderance of will, knowledge, riches, and influence, will avail themselves of democratic Europe as the most suitable and supple instrument they can have for taking the fate of the earth into their own hands, and working as artists upon man himself. Enough! The time is coming for us to transform all our views on politics.

5. The Great Man.

961.

I will endeavour to see at which periods in history great men arise. The significance of despotic moralities that have lasted a long time: they strain the bow, provided they do not break it.

962.

A great man,--a man whom Nature has built up and invented in a grand style,--What is such a man? _First,_ in his general course of action his consistency is so broad that owing to its very breadth it can be surveyed only with difficulty, and consequently misleads; he possesses the capacity of extending his will over great stretches of his life, and of despising and rejecting all small things, whatever most beautiful and "divine" things of the world there may be among them. _Secondly,_ he is _colder, harder, less cautious and more free from the fear of "public opinion";_ he does not possess the virtues which are compatible with respectability and with being respected, nor any of those things which are counted among the "virtues of the herd." If he is unable to _lead_, he walks alone; he may then perchance grunt at many things which he meets on his way. _Thirdly_, he asks for no "compassionate" heart, but servants, instruments; in his dealings with men his one aim is _to make_ something out of them. He knows that he cannot reveal himself to anybody: he thinks it bad taste to become familiar; and as a rule he is not familiar when people think he is. When he is not talking to his soul, he wears a mask. He would rather lie than tell the truth, because lying requires more spirit and _will_. There is a loneliness within his heart which neither praise nor blame can reach, because he is his own judge from whom is no appeal.

963.

The great man is necessarily a sceptic (I do not mean to say by this that he must appear to be one), provided that greatness consists in this: to _will_ something great, together with the means thereto. Freedom from any kind of conviction is a factor in his _strength of will_. And thus it is in keeping with that "enlightened form of despotism" which every great passion exercises. Such a passion enlists intellect in its service; it even has the courage for unholy means; it creates without hesitation; it allows itself convictions, it even _uses_ them, but it never submits to them. The need of faith and of anything unconditionally negative or

affirmative is a proof of weakness; all weakness is weakness of will. The man of faith, the believer, is necessarily an inferior species of man. From this it follows that "all freedom of spirit," _i.e._ instinctive scepticism, is the prerequisite of greatness.

964.

The great man is conscious of his power over a people, and of the fact that he coincides temporarily with a people or with a century--this _magnifying_ of his self-consciousness as _causa_ and _voluntas_ is _misunderstood_ as "altruism": he feels driven to _means_ of communication: all great men are _inventive_ in such means. They want to form great communities in their own image; they would fain give multiformity and disorder definite shape; it stimulates them to behold chaos.

The misunderstanding of love. There is a _slavish_ love which subordinates itself and gives itself away--which idealises and deceives itself; there is a _divine_ species of love which despises and loves at the same time, and which _remodels_ and _elevates_ the thing it loves.

The object is to attain that enormous _energy of greatness_ which can model the man of the future by means of discipline and also by means of the annihilation of millions of the bungled and botched, and which can yet avoid _going to ruin_ at the sight of the suffering _created_ thereby, the like of which has never been seen before.

965.

The revolution, confusion, and distress of whole peoples is in my opinion of less importance than _the misfortunes which attend great individuals in their development._ We must not allow ourselves to be deceived: the many misfortunes of all these small folk do not together constitute a sum-total, except in the feelings of _mighty_ men.--To think of one's self in moments of great danger, and to draw ones own advantage from the calamities of thousands in the case of the man who differs very much from the common ruck--may be a sign of a great character which is able to master its feeling of pity and justice.

966.

In contradistinction to the animal, man has developed such a host of _antagonistic_ instincts and impulses in himself, that he has become master of the earth by means of this synthesis.--Moralities are only the expression of local and limited _orders of rank in_ this multifarious world of instincts which prevent man from perishing through their _antagonism._ Thus a masterful instinct so weakens and subtilises the instinct which opposes it that it becomes an _impulse_ which provides the _stimulus_ for the activity of the principal instinct.

The highest man would have the greatest multifariousness in his instincts, and he would _possess_ these in the relatively strongest degree in which he is able to endure them. As a matter of fact, wherever the plant, man, is found strong, mighty instincts are to be found opposing each other (_e.g._ Shakespeare), but they are subdued.

967.

Would one not be justified in reckoning all great men among the _wicked?_ This is not so easy to demonstrate in the case of individuals. They are so frequently capable of masterly dissimulation that they very often assume the airs and forms of great virtues. Often, too, they seriously reverence virtues, and in such a way as to be passionately hard towards themselves; but as the result of cruelty. Seen from a distance such things are liable to deceive. Many, on the other hand, misunderstand themselves; not infrequently, too, a great mission will call forth great qualities, _e.g._ justice. The essential fact is: the greatest men may also perhaps have great virtues, but then they also have the opposites of these virtues. I believe that it is precisely out of the presence of these opposites and of the feelings they suscitate, that the great man arises,--for the great man is the broad arch which spans two banks lying far apart.

968.

In _great men_ we find the specific qualities of life in their highest manifestation: injustice, falsehood, exploitation. But inasmuch as their effect has always been _overwhelming,_ their essential nature has been most thoroughly misunderstood, and interpreted as goodness. The type of such an interpreter would be Carlyle.[5]

[Footnote 5: This not only refers to _Heroes and Hero-Worship,_ but doubtless to Carlyle's prodigious misunderstanding of Goethe a misunderstanding which still requires to be put right by a critic untainted by Puritanism.--Tr.]

969.

Generally speaking, everything _is worth no more and no less than one has paid for it._ This of course does not hold good in the case of an isolated individual; the great capacities of the individual have no relation whatsoever to that which he has done, sacrificed, and suffered for them. But if one should examine the previous history of his race one would be sure to find the record of an extraordinary storing up and capitalising of power by means of all kinds of abstinence, struggle, industry, and determination. It is because the great man has cost so much, and not because he stands there as a miracle, as a gift from heaven, or as an accident, that he became great: "Heredity" is a false notion. A man's ancestors have always paid the price of what he is.

970.

The danger of modesty. To adapt ourselves too early to duties, societies, and daily schemes of work in which accident may have placed us, at a time when neither our powers nor our aim in life has stepped peremptorily into our consciousness; the premature certainty of conscience and feeling of relief and of sociability which is acquired by this precocious, modest attitude, and which appears to our minds as a deliverance from those inner and outer disturbances of our feelings--all this pampers and keeps a man down in the most dangerous fashion imaginable. To learn to respect things which people about us respect, as if we had no standard or right of our own to determine values; the strain of appraising things as others appraise them, _counter_ to the whisperings of our inner taste, which also has a conscience of its own, becomes a terribly subtle kind of constraint: and if in the end no explosion takes place which bursts all the bonds of love and morality at once, then such a spirit becomes withered, dwarfed, feminine, and objective. The reverse of this is bad enough, but still it is better than the foregoing: to suffer from one's environment, from its praise just as much as from its blame; to be wounded by it and to fester inwardly without betraying the fact; to defend one's self involuntarily and suspiciously against its love; to learn to be silent, and perchance to conceal this by talking; to create nooks and safe, lonely hiding-places where one can go and take breath for a moment, or shed tears of sublime comfort--until at last one has grown strong enough to say: "What on earth have I to do with you?" and to go _one's_ way alone.

971.

Those men who are in themselves destinies, and whose advent is the advent of fate, the whole race of _heroic_ bearers of burdens: oh! how heartily and gladly would they have respite from themselves for once in a while!--how they crave after stout hearts and shoulders, that they might free themselves, were it but for an hour or two, from that which oppresses them! And how fruitlessly they crave! ... They wait; they observe all that passes before their eyes: no man even cometh nigh to them with a thousandth part of their suffering and passion, no man guesseth to what end they have waited.... At last, at last, they learn the first lesson of their life: to wait no longer; and forthwith they learn their second lesson: to be affable, to be modest; and from that time onwards to endure everybody and every kind of thing--in short, to endure still a little more than they had endured theretofore.

6. The Highest Man as Lawgiver of the Future.

972.

The lawgivers of the future.--After having tried for a long time in vain to attach a particular meaning to the word "philosopher,"--for I found many antagonistic traits, I recognised that we can distinguish between two kinds of philosophers:--

(1) Those who desire to establish any large system of values (logical or moral);

(2) Those who are the _lawgivers_ of such valuations.

The former try to seize upon the world of the present or the past, by embodying or abbreviating the multifarious phenomena by means of signs: their object is to make it possible for us to survey, to reflect upon, to comprehend, and to utilise everything that has happened hitherto--they serve the purpose of man by using all past things to the benefit of his future.

The second class, however, are _commanders;_ they say: "Thus shall it be!" They alone determine the "whither" and the "wherefore," and that which will be useful and beneficial to man; they have command over the previous work of scientific men, and all knowledge is to them only a means to their creations. This second kind of philosopher seldom appears; and as a matter of fact their situation and their danger is appalling. How often have they not intentionally blindfolded their eyes in order to shut out the sight of the small strip of ground which separates them from the abyss and from utter destruction. Plato, for instance, when he

persuaded himself that "the good," as he wanted it, was not Plato's good, but "the good in itself," the eternal treasure which a certain man of the name of Plato had chanced to find on his way! This same will to blindness prevails in a much coarser form in the case of the founders of religion; their "Thou shalt" must on no account sound to their ears like "I will,"--they only dare to pursue their task as if under the command of God; their legislation of values can only be a burden they can bear if they regard it as "revelation," in this way their conscience is not crushed by the responsibility.

As soon as those two comforting expedients--that of Plato and that of Muhammed--have been overthrown, and no thinker can any longer relieve his conscience with the hypothesis "God" or "eternal values," the claim of the lawgiver to determine new values rises to an awfulness which has not yet been experienced. Now those elect, on whom the faint light of such a duty is beginning to dawn, try and see whether they cannot escape it--as their greatest danger--by means of a timely side-spring: for instance, they try to persuade themselves that their task is already accomplished, or that it defies accomplishment, or that their shoulders are not broad enough for such burdens, or that they are already taken up with burdens closer to hand, or even that this new and remote duty is a temptation and a seduction, drawing them away from all other duties; a disease, a kind of madness. Many, as a matter of fact, do succeed in evading the path appointed to them: throughout the whole of history we can see the traces of such deserters and their guilty consciences. In most cases,, however, there comes to such men of destiny that hour of delivery, that autumnal season of maturity, in which they are forced to do that which they did not even "wish to do": and that deed before which in the past they have trembled most, falls easily and unsought from the tree, as an involuntary deed, almost as a present.

973.

The human horizon.--Philosophers may be conceived as men who make the greatest efforts to _discover_ to what extent man can _elevate_ himself--this holds good more particularly of Plato: how far man's _power_ can extend. But they do this as individuals; perhaps the instinct of Cæsars and of all founders of states, etc., was greater, for it preoccupied itself with the question how far man could be urged forward in _development_ under "favourable circumstances." What they did not sufficiently understand, however, was the nature of favourable circumstances. The great question: "Where has the plant 'man' grown most magnificently heretofore? In order to answer this, a comparative study of history is necessary.

974.

Every fact and every work exercises a fresh persuasion over every age and every new species of man. History always enunciates new truths.

975.

To remain objective, severe, firm, and hard while making a thought prevail is perhaps the best forte of artists; but if for this purpose any one have to work upon human material (as teachers, statesmen, have to do, etc.), then the repose, the coldness, and the hardness soon vanish. In natures like Cæsar and Napoleon we are able to divine something of the nature of "disinterestedness" in their work on their marble, whatever be the number of men that are sacrificed in the process. In this direction the future of higher men lies: to bear the greatest responsibilities and not to go to rack and ruin through them.--Hitherto the deceptions of inspiration have almost always been necessary for a man not to lose faith in his own hand, and in his right to his task.

976.

The reason why philosophers are mostly failures. Because among the conditions which determine them there are qualities which generally ruin other men:--

(1) A philosopher must have an enormous multiplicity of qualities; he must be a sort of abbreviation of man and have all man's high and base desires: the danger of the contrast within him, and of the possibility of his loathing himself;

(2) He must be inquisitive in an extraordinary number of ways: the danger of versatility;

(3) He must be just and honest in the highest sense, but profound both in love and hate (and in injustice);

(4) He must not only be a spectator but a lawgiver: a judge and defendant (in so far as he is an abbreviation of the world);

(5) He must be extremely multiform and yet firm and hard. He must be supple.

977.

The really _regal_ calling of the philosopher (according to the expression of Alcuin the Anglo-Saxon): "_Prava corrigere, et recta corroborare, et sancta sublimare._"

978.

The new philosopher can only arise in conjunction with a ruling class, as the highest spiritualisation of the latter. Great politics, the rule of the earth, as a proximate contingency, the total _lack of principles_ necessary thereto.

979.

Fundamental concept: the new values must first be created--this remains _our duty_! The philosopher must be our lawgiver. New species. (How the greatest species hitherto [for instance, the Greeks] were reared: this kind of accident must now be _consciously_ striven for.)

980.

Supposing one thinks of the philosopher as an educator who, looking down from his lonely elevation, is powerful enough to draw long chains of generations up to him: then he must be granted the most terrible privileges of a great educator. An educator never says what he himself thinks; but only that which he thinks it is good for those whom he is educating to hear upon any subject. This dissimulation on his part must not be found out; it is part of his masterliness that people should believe in his honesty, he must be capable of all the means of discipline and education: there are some natures which he will only be able to raise by means of lashing them with his scorn; others who are lazy, irresolute, cowardly, and vain, he will be able to affect only with exaggerated praise. Such a teacher stands beyond good and evil, but nobody must know that he does.

981.

We must _not_ make men "better," we must _not_ talk to them about morality in any form as if "morality in itself," or an ideal kind of man in general, could be taken for granted; but we must _create circumstances_ in which _stronger men are necessary,_ such as for their part will require a morality (or, better still: a bodily and spiritual discipline) which makes men strong, and upon which they will consequently insist! As they will need one so badly, they will have it.

We must not let ourselves be seduced by blue eyes and heaving breasts: _greatness of soul has absolutely nothing romantic about it. And unfortunately nothing whatever amiable either._

982.

From warriors we must learn: (1) to associate death with those interests for which we are fighting--that makes us venerable; (2) we must learn to _sacrifice_ numbers, and to take our cause sufficiently seriously not to spare men; (3) we must practise inexorable discipline, and allow ourselves violence and cunning in war.

983.

The _education_ which rears those _ruling_ virtues that allow a man to become master of his benevolence and his pity: the great disciplinary virtues ("Forgive thine enemies" is mere child's play beside them), _and the passions of the creator, must be elevated_ to the heights--we must cease from carving marble! The exceptional and powerful position of those creatures (compared with that of all princes hitherto): the Roman Cæsar with Christ's soul.

984.

We must not separate greatness of soul from intellectual greatness. For the former involves _independence_; but without intellectual greatness independence should not be allowed; all it does is to create disasters even in its lust of well-doing and of practising "justice." Inferior spirits _must_ obey, consequently they cannot be possessed of greatness.

985.

The more lofty philosophical man who is surrounded by loneliness, not because he wishes to be alone, but because he is what he is, and cannot find his equal: what a number of dangers and torments are reserved for him, precisely at the present time, when we have lost our belief in the order of rank, and consequently no longer know how to understand or honour this isolation! Formerly the sage almost sanctified himself in the consciences of the mob by going aside in this way; to-day the anchorite sees himself as though enveloped in a cloud of gloomy doubt and suspicions. And not alone by the envious and the wretched: in every well-meant act that he experiences he is bound to discover misunderstanding, neglect, and superficiality. He knows the crafty tricks of foolish pity which makes these people feel so good and holy when they attempt to save him from his own destiny, by giving him more comfortable situations and more decent and reliable society. Yes, he will even get to admire the unconscious lust of destruction with which all mediocre spirits stand up and oppose him, believing all the while that they have a holy right to do so! For men of such incomprehensible loneliness it is necessary to put a good stretch of country between them and the officiousness of their fellows: this is part of their prudence. For such a man to maintain himself uppermost to-day amid the dangerous maelstroms of the age which threaten to draw him under, even cunning and disguise will be necessary. Every attempt he makes to order his life in the present and with the present, every time he draws near to these men and their modern desires, he will have to expiate as if it were an actual sin: and withal he may look with wonder at the concealed wisdom of his nature, which after every one of these attempts immediately leads him back to himself by means of illnesses and painful accidents.

986.

"Maledetto colui _che contrista, un spirto immortal!"_ MANZONI (_Conte di Carmagnola,_ Act II.)

987.

The most difficult and the highest form which man can attain is the most seldom successful: thus the history of philosophy reveals a superabundance of bungled and unhappy cases of manhood, and its march is an extremely slow one; whole centuries intervene and suppress what has been achieved: and in this way the connecting-link is always made to fail. It is an appalling history, this history of the highest men, of the sages.--What is most often damaged is precisely the recollection of great men, for the semi-successful and botched cases of mankind misunderstand them and overcome them by their "successes." Whenever an "effect" is noticeable, the masses gather in a crowd round it; to hear the inferior and the poor in spirit having their say is a terrible ear-splitting torment for him who knows and trembles at the thought, that the fate of man depends upon the success of its highest types. From the days of my childhood I have reflected upon the sage's conditions of existence, and I will not conceal my happy conviction that in Europe he has once more become possible--perhaps only for a short time.

988.

These new philosophers begin with a description of a systematic order of rank and difference of value among men,--what they desire is, alas precisely the reverse of an assimilation and equalisation of man: they teach estrangement in every sense, they cleave gulfs such as have never yet existed, and they would fain have man become more evil than he ever was. For the present they live concealed and estranged even from each other. For many reasons they will find it necessary to be anchorites and to wear masks--they will therefore be of little use in the matter of seeking for their equals. They will live alone, and probably know the torments of all the loneliest forms of loneliness. Should they, however, thanks to any accident, meet each other on the road, I wager that they would not know each other, or that they would deceive each other in a number of ways.

989.

"Les philosophes ne sont pas faits pour s'aimer. Les aigles ne volent point en compagnie. Il faut laisser cela aux perdrix, aux étourneaux ... Planer au-dessus et avoir des griffes, voila le lot des grands génies."--GALIANI.

990.

I forgot to say that such philosophers are cheerful, and that they like to sit in the abyss of a perfectly clear sky: they are in need of different means for enduring life than other men; for they suffer in a different way (that is to say, just as much from the depth of their contempt of man as from their love of man).--The animal which suffered most on earth discovered for itself _--laughter._

991.

Concerning the misunderstanding of "cheerfulness." --It is a temporary relief from long tension; it is the wantonness, the Saturnalia of a spirit, which is consecrating and preparing itself for long and terrible resolutions. The "fool" in the form of "science."

992.

The new order of rank among spirits; tragic natures no longer in the van.

993.

It is a comfort to me to know that over the smoke and filth of human baseness there is a _higher and brighter_ mankind, which, judging from their number, must be a small race (for everything that is in any way distinguished is _ipso facto_ rare). A man does not belong to this race because he happens to be more gifted, more virtuous, more heroic, or more loving than the men below, but because he is _colder, brighter, more far-sighted, and more lonely;_ because he endures, prefers, and even insists upon, loneliness as the joy, the privilege, yea, even the condition of existence; because he lives amid clouds and lightnings as among his equals, and likewise among sunrays, dewdrops, snowflakes, and all that which must needs come from the heights, and which in its course moves ever from heaven to earth. The desire to look aloft is not our desire.--Heroes, martyrs, geniuses, and enthusiasts of all kinds, are not quiet, patient, subtle, cold, or slow enough for us.

994.

The absolute conviction that valuations above and below are different; that innumerable experiences are wanting to the latter: that when looking upwards from below misunderstandings are necessary.

995.

How do men attain to great power and to great tasks? All the virtues and proficiences of the body and the soul are little by little laboriously acquired, through great industry, self-control, and keeping one's self within narrow bounds, through a frequent, energetic, and genuine repetition of the same work and of the same hardships; but there are men who are the heirs and masters of this slowly acquired and manifold treasure of virtues and proficiences because, owing to happy and reasonable marriages and also to lucky accidents, the acquired and accumulated forces of many generations, instead of being squandered and subdivided, have been assembled together by means of steadfast struggling and willing. And thus, in the end, a man appears who is such a monster of strength, that he craves for a monstrous task. For it is our power which has command of us: and the wretched intellectual play of aims and intentions and motivations lies only in the foreground--however much weak eyes may recognise the principal factors in these things.

990.

The sublime man has the highest value, even when he is most delicate and fragile, because an abundance of very difficult and rare things have been reared through many generations and united in him.

997.

I teach that there are higher and lower men, and that a single individual may under certain circumstances justify whole millenniums of existence --that is to say, a wealthier, more gifted, greater, and more complete man, as compared with innumerable imperfect and fragmentary men.

998.

Away from rulers and rid of all bonds, live the highest men: and in the rulers they have their instruments.

999.

The order of rank: he who _determines_ values and leads the will of millenniums, and does this by leading the highest natures--he _is the highest man._

1000.

I fancy I have divined some of the things that lie hidden in the soul of the highest man; perhaps every man who has divined so much must go to ruin: but he who has seen the highest man must do all he can to make him _possible._ Fundamental thought: we must make the future the standard of all our valuations--and not seek the laws for our conduct behind us.

1001.

Not "mankind," but _Superman_ is the goal!

1002.

"Come l'uom s'eterna...."--_Inf._ xv. 85.

II.

DIONYSUS.

1003.

To _him who is one of Nature's lucky strokes,_ to, him unto whom my heart goes out, to him who is carved from one integral block, which is hard, sweet, and fragrant--to him from whom even my nose can derive some pleasure--let this book be dedicated.

He enjoys that which is beneficial to him.

His pleasure in anything ceases when the limits of what is beneficial to him are overstepped.

He divines the remedies for partial injuries; his illnesses are the great stimulants of his existence.

He understands how to exploit his serious accidents.

He grows stronger under the misfortunes which threaten to annihilate him.

He instinctively gathers from all he sees, hears, and experiences, the materials for what concerns him most,--he pursues a selective principle,--he rejects a good deal.

He reacts with that tardiness which long caution and deliberate _pride_ have bred in him,--he tests the stimulus: whence does it come? whither does it lead? He does not submit.

He is always in his own company, whether his intercourse be with books, with men, or with Nature.

He honours anything by choosing it, by conceding to it, by trusting it.

1004.

We should attain to such a height, to such a lofty eagle's ledge, in our observation, as to be able to understand that everything happens, _just as it ought to happen_: and that all "imperfection," and the pain it brings, belong to all that which is most eminently desirable.

1005.

Towards 1876 I experienced a fright; for I saw that everything I had most wished for up to that time was being compromised. I realised this when I perceived what Wagner was actually driving at: and I was bound very fast to him--by all the bonds of a profound similarity of needs, by gratitude, by the thought that he could not be replaced, and by the absolute void which I saw facing me.

Just about this time I believed myself to be inextricably entangled in my philology and my professorship--in the accident and last shift of my life: I did not know how to get out of it, and was tired, used up, and on my last legs.

At about the same time I realised that what my instincts most desired to attain was precisely the reverse of what Schopenhauer's instincts wanted--that is to say, a _justification of life,_ even where it was most terrible, most equivocal, and most false: to this end, I had the formula "_Dionysian_" in my hand.

Schopenhauer's interpretation of the "absolute" as _will_ was certainly a step towards that concept of the "absolute" which supposed it to be necessarily good, blessed, true, and integral, but Schopenhauer did not understand how to deify this will: he remained suspended in the moral-Christian ideal. Indeed, he was still so very much under the dominion of Christian values, that, once he could no longer regard the absolute as God, he had to conceive it as evil, foolish, utterly reprehensible. He did not realise that there is an infinite number of ways of being different, and even of being God.

1006.

Hitherto, moral values have been the highest values: does anybody doubt this? If we bring down the values from their pedestal, we thereby alter _all_ values; the principle of their _order of rank_ which has prevailed hitherto is thus overthrown.

1007.

Transvalue values--what does this mean? It implies that all spontaneous motives, all new, future, and stronger motives, are still extant; but that they now appear under false names and false valuations, and have not yet become conscious of themselves.

We ought to have the courage to become, conscious, and to affirm all that which has been _attained_--to get rid of the humdrum character of old valuations, which makes us unworthy of the best and strongest things that we have achieved.

1008.

Any doctrine would be superfluous for which everything is not already prepared in the way of accumulated forces and explosive material. A transvaluation of values can only be accomplished when there is a tension of new needs, and a new set of needy people who feel all old values as painful,--although they are not conscious of what is wrong.

1009.

The standpoint from which my values are determined: is abundance or desire active? ... Is one a mere spectator, or is one's own shoulder at the wheel--is one looking away or is one turning aside? ... Is one acting spontaneously, as the result of accumulated strength, or is one merely reacting to a goad or to a stimulus? ... Is one simply acting as the result of a paucity of elements, or of such an overwhelming dominion over a host of elements that this power enlists the latter into its service if it requires them? ... Is one a _problem_ one's self or is one a _solution_ already? ... Is _one perfect_ through the smallness of the task, or _imperfect_ owing to the extraordinary character of the aim? ... Is one genuine or only an _actor;_ is one genuine as an actor, or only the bad copy of an actor? is one a representative or the creature represented? Is one a personality or merely a rendezvous of personalities? ... Is one ill from a disease or from surplus health? Does one lead as a shepherd, or as an "exception" (third alternative: as a fugitive)? Is one in need of dignity, or can one play the clown? Is one in search of resistance, or is one evading it? Is one imperfect owing to one's precocity or to one's tardiness? Is it one's nature to say yea, or no, or is one a peacock's tail of garish parts? Is one proud enough not to feel ashamed even of one's vanity? Is one still able to feel a bite of conscience (this species is becoming rare; formerly conscience had to bite too often: it is as if it now no longer had enough teeth to do so)? Is one still capable of a "duty"? (there are some people who would lose the whole joy of their lives if they were _deprived_ of their duty--this holds good especially of feminine creatures, who are born subjects).

1010.

Supposing our common comprehension of the universe were a _misunderstanding,_ would it be possible to conceive of a form of _perfection,_ within the limits of which even such a _misunderstanding as this_ could be sanctioned?

The concept of a _new_ form of perfection: that which does _not_ correspond to our logic, to our "beauty," to our "good," to our "truth," might be perfect in a _higher_ sense even than our ideal is.

1011.

Our most important limitation: we must not deify the unknown; we are just beginning to know so little. The false and wasted endeavours.

Our "new world": we must ascertain to what extent we are the _creators_ of our valuations--we will thus be able to put "sense" into history.

This belief in truth is reaching its final logical conclusion in us--ye know how it reads: that if there is anything at all that must be worshipped it is _appearance;_ that _falsehood_ and _not_ truth is--divine.

1012.

He who urges rational thought forward, thereby also drives its antagonistic power--mysticism and foolery of every kind--to new feats of strength.

We should recognise that every movement is (1) _partly_ the manifestation of fatigue resulting from a previous movement (satiety after it, the malice of weakness towards it, and disease); and (2) _partly_ a newly awakened accumulation of long slumbering forces, and therefore wanton, violent, healthy.

1013.

Health and morbidness: let us be careful! The standard is the bloom of the body, the agility, courage, and cheerfulness of the mind--but also, of course, how much _morbidness a man can bear and overcome,_--and convert into health. That which would send more delicate natures to the dogs, belongs to the stimulating means of _great_ health.

1014.

It is only a question of power: to have all the morbid traits of the century, but to balance them I by means of overflowing, plastic, and rejuvenating power. The _strong_ man.

1015.

_Concerning the strength of the nineteenth century.--_We are more mediæval than the eighteenth century; not only more inquisitive or more susceptible to the strange and to the rare. We have revolted against the _Revolution,_ ... We have freed ourselves from the fear of reason, which was the spectre of the eighteenth century: we once more dare to be childish, lyrical, absurd, in a word, we are musicians. And we are just as little frightened of the _ridiculous_ as of the _absurd._ The _devil_ finds that he is tolerated even by God:[6] better still, he has become interesting as one who has been misunderstood and slandered for ages,--we are the saviours of the devil's honour.

We no longer separate the great from the terrible. We reconcile good things, in all their complexity, with the very _worst_ things; we have overcome the _desideratum_ of the past (which wanted goodness to grow without the increase of evil). The _cowardice_ towards the ideal, peculiar to the Renaissance, has diminished--we even dare to aspire to the latter's morality. _Intolerance_ towards priests and the Church has at the same time come to an end; "It is immoral to believe in God"--but this is precisely what we regard as the best possible justification of this belief.

On all these things we have conferred the civic rights of our minds. We do not tremble before the back side of "good things" (we even look for it, we are brave and inquisitive enough for that), of Greek antiquity, of morality, of reason, of good taste, for instance (we reckon up the losses which we incur with all this treasure: we almost reduce ourselves to poverty with such a treasure). Neither do we conceal the back side of "evil things" from ourselves.

[Footnote 6: This is reminiscent of Goethe's _Faust,_ See "Prologue in Heaven."--Tr.]

1016.

That which does us honour.--If anything does us honour, it is this: we have transferred our seriousness to other things; all those things which have been despised and laid aside as base by all ages, we regard as important--on the other hand, we surrender "fine feelings" at a cheap rate.

Could any aberration be more dangerous than the contempt of the body? As if all intellectuality were not thereby condemned to become morbid, and to take refuge in the _vapeurs_ of "idealism"!

Nothing that has been thought out by Christians and idealists holds water: we are more radical. We have discovered the "smallest world" everywhere as the most decisive.

The paving-stones in the streets, good air in our rooms, food understood according to its worth: we value all the _necessaries_ of life seriously, and _despise_ all "beautiful soulfulness" as a form of "levity and frivolity." That which has been most despised hitherto, is now pressed into the front rank.

1017

In the place of Rousseau's "man of Nature," the nineteenth century has discovered a much _more genuine_ image of "Man,"--it had the courage to do this.... On the whole, the Christian concept of man has in a way been reinstalled. What we have not had the courage to do, was to call precisely this "man _par excellence_," good, and to see the future of mankind guaranteed in him. In the same way, we did not dare to regard the _growth in the terrible side_ of man's character as an accompanying feature of every advance in culture; in this sense we are still under the influence of the Christian ideal, and side with it against paganism, and likewise against the Renaissance concept of _virtù._ But the key of culture is not to be found in this way: and _in praxi_ we still have the forgeries of history in favour of the "good man" (as if he alone constituted the progress of humanity) and the _socialistic ideal (i.e._ the _residue_ of Christianity and of Rousseau in the de-Christianised world).

The fight against the eighteenth century: it meets with its _greatest conquerors_ in _Goethe_ and _Napoleon._ Schopenhauer, too, fights against the eighteenth century; but he returns involuntarily to the seventeenth--he is a modern Pascal, with Pascalian valuations, _without_ Christianity. Schopenhauer was not strong enough to invent a _new yea._

Napoleon: we see the necessary relationship between the higher and the terrible man. "Man" reinstalled, and her due of contempt and fear restored to woman. Highest activity and health are the signs of the great man; the straight line and grand style rediscovered in action; the mightiest of all instincts, that of life itself,--the lust of dominion,--heartily welcomed.

1018.

(_Revue des deux mondes,_ 15th February 1887. Taine concerning Napoleon) "Suddenly the master faculty reveals itself: the _artist,_ which was latent in the politician, comes forth from his scabbard; he creates _dans l'idéal et l'impossible._ He is once more recognised as that which he is: the posthumous brother of Dante and of Michelangelo; and verily, in view of the definite contours of his vision, the intensity, the coherence, and inner consistency of his dream, the depth of his meditations, the superhuman greatness of his conception, he is their equal: _son génie a la même taille et la même structure; il est un des trois esprits souverains de la renaissance italienne._"

Nota bene. Dante, Michelangelo, Napoleon.

1019.

Concerning the pessimism of strength. In the internal economy of _the primitive_ man's soul, the _fear_ of evil preponderates. What is _evil!_ Three kinds of things: accident, uncertainty, the unexpected. How does primitive man combat evil?--He conceives it as a thing of reason, of power, even as a person. By this means he is enabled to make treaties with it, and generally to operate upon it in advance--to forestall it.

--Another expedient is to declare its evil and harmful character to be but apparent: the consequences of accidental occurrences, and of uncertainty and the unexpected, are interpreted as _well-meant,_ as reasonable.

--A third means is to interpret evil, above all, as merited: evil is thus justified as a punishment.

--In short, _man submits to in_ all religious and moral interpretations are but forms of submission to evil.--The belief that a good purpose lies behind all evil, implies the renunciation of any desire to combat it.

Now, the history of every culture shows a diminution of this _fear of the accidental, of the uncertain, and of the unexpected._ Culture means precisely, to learn to reckon, to discover causes, to acquire the power of forestalling events, to acquire a belief in necessity. With the growth of culture, man is able to dispense with that primitive form of submission to evil (called religion or morality), and that "justification of evil." Now he wages war against "evil,"--he gets rid of it. Yes, a state of security, of belief in law and the possibility of calculation, is possible, in which consciousness regards these things with tedium,--in which the joy of the accidental, of the uncertain, and of the unexpected, actually becomes a spur.

Let us halt a moment before this symptom of _highest_ culture, I call it the _pessimism of strength._ Man now no longer requires a "justification of evil"; justification is precisely what he abhors: he enjoys evil, _pur, cru_; he regards purposeless evil as the most interesting kind of evil. If he had required a God in the past, he now delights in cosmic disorder without a God, a world of accident, to the essence of which terror, ambiguity, and seductiveness belong.

In a state of this sort, it is precisely _goodness_ which requires to be justified--that is to say, it must either have an evil and a dangerous basis, or else it must contain a vast amount of stupidity: _in which case it still pleases._ Animality no longer awakens terror now; a very intellectual and happy wanton spirit in favour of the animal in man, is, in such periods, the most triumphant form of spirituality. Man is now strong enough to be able to feel ashamed of _a belief in God:_ he may now play the part of the devil's advocate afresh. If in practice he pretends to uphold virtue, it will be for those reasons which lead virtue to be associated with subtlety, cunning, lust of gain, and a form of the lust of power.

This pessimism of strength also ends in a _theodicy, i.e._ in an absolute saying of yea to the world--but the same arguments will be raised in favour of life which formerly were raised against it: and in this way, in a conception of this world _as the highest ideal possible,_ which has been effectively attained.

1020.

The principal kinds of pessimism:--

The pessimism of _sensitiveness_ (excessive irritability with a preponderance of the feelings of pain).

The pessimism of the _will that is not free_ (otherwise expressed: the lack of resisting power against stimuli).

The pessimism of _doubt_ (shyness in regard to everything fixed, in regard to all grasping and touching).

The psychological conditions which belong to these different kinds of pessimism, may all be observed in a lunatic asylum, even though they are there found in a slightly exaggerated form. The same applies to "Nihilism" (the penetrating feeling of nonentity).

What, however, is the nature of Pascal's moral pessimism, and the _metaphysical pessimism_ of the Vedânta-Philosophy? What is the nature of the _social pessimism_ of anarchists (as of Shelley), and of the pessimism of compassion (like that of Leo Tolstoy and of Alfred de Vigny)?

Are all these things not also the phenomena of decay and sickness?... And is not excessive seriousness in regard to moral values, or in regard to "other-world" fictions, or social calamities, or _suffering_ in general, of the same order? All such _exaggeration_ of a single and narrow standpoint is in itself a sign of sickness. The same applies to the preponderance of a negative over an affirmative attitude!

In this respect we must not confound with the above: the joy of saying and doing _no,_ which is the result of the enormous power and tenseness of an affirmative attitude--peculiar to all rich and mighty men and ages. It is, as it were, a luxury, a form of courage too, which opposes the terrible, which has sympathy with the frightful and the questionable, because, among other things, one is terrible and questionable: the _Dionysian_ in will, intellect, and taste.

1021.

My Five "Noes."

(1) My fight against _the feeling of sin_ and the introduction of the notion of _punishment_ into the physical and metaphysical world, likewise into psychology and the interpretation of history. The recognition of the fact that all philosophies and valuations hitherto have been saturated with morality.

(2) My identification and my discovery of the _traditional_ ideal, of the Christian ideal, even where the dogmatic form of Christianity has been wrecked. The _danger of the Christian ideal_ resides in its valuations, in that which can dispense with concrete expression: my struggle against _latent Christianity_ (for instance, in music, in Socialism).

(3) My struggle against the eighteenth century of Rousseau, against his "Nature," against his "good man," his belief in the dominion of feeling--against the pampering, weakening, and moralising of man: an ideal born of the _hatred of aristocratic culture,_ which in practice is the dominion of unbridled feelings of resentment, and invented as a standard for the purpose of war (the Christian

morality of the feeling of sin, as well as the morality of resentment, is an attitude of the mob).

(4) My fight against _Romanticism,_ in which the ideals of Christianity and of Rousseau converge, but which possesses at the same time a yearning for that _antiquity_ which knew of sacerdotal and aristocratic culture, a yearning for _virtù,_ and for the "strong man"--something extremely hybrid; a false and imitated kind of _stronger_ humanity, which appreciates extreme conditions in general and sees the symptom of strength in them ("the cult of passion"; an imitation of the most expressive _forms, furore espressivo,_ originating not out of plenitude, but out _of want)._--(In the nineteenth century there are some things which are born out of relative plenitude--_i.e._ out of _well-being;_ cheerful music, etc.--among poets, for instance, Stifter and Gottfried Keller give signs of more strength and inner well-being than--. The great strides of engineering, of inventions, of the natural sciences and of history (?) are relative products of the strength and self-reliance of the nineteenth century.)

(5) My struggle against the _predominance of gregarious instincts,_ now science makes common cause with them; against the profound hate with which every kind of order of rank and of aloofness is treated.

1022.

From the pressure of plenitude, from the tension of forces that are continually increasing within us and which cannot yet discharge themselves, a condition is produced which is very similar to that which precedes a storm: we--like Nature's sky--become overcast. I hat, too, is "pessimism.".. A teaching which puts an end to such a condition by the fact that it _commands_ something: a transvaluation of values by means of which the accumulated forces are given a channel, a direction, so that they explode into deeds and flashes of lightning-does not in the least require to be a hedonistic teaching: in so far as it _releases strength_ which was compressed to an agonising degree, it brings happiness.

1023.

Pleasure appears with the feeling of power.

Happiness means that the consciousness of power and triumph has begun to prevail.

Progress is the strengthening of the type, the ability to exercise great will-power, everything else is a misunderstanding and a danger.

1024.

There comes a time when the old masquerade and moral togging-up of the passions provokes repugnance: _naked Nature;_ when the _quanta_ of _power_ are recognised as _decidedly_ simple (as _determining rank_); when _grand style_ appears again as the result of great passion.

1025.

The purpose of culture _would have_ us enlist everything terrible, step by step and experimentally, into its service; but before it is _strong enough_ for this it must combat, moderate, mask, and even curse everything terrible.

Wherever a culture points to anything as evil, it betrays its _fear_ and therefore weakness.

Thesis: everything good is the evil of yore which has been rendered serviceable. _Standard:_ the more terrible and the greater the passions may be which an age, a people, and an individual are at liberty to possess, because they are able to use them as _a means, the higher is their culture:_ the more mediocre, weak, submissive, and cowardly a man may be, the more things he will regard as _evil:_ according to him the kingdom of evil is the largest. The lowest man will see the kingdom of evil (_i.e._ that which is forbidden him and which is hostile to him) everywhere.

1026.

It is not a fact that "happiness follows virtue"--but it is the mighty man who first _declares his happy state to be virtue._

Evil actions belong to the mighty and the virtuous: bad and base actions belong to the subjected.

The mightiest man, the creator, would have to be the most evil, inasmuch as he makes his ideal prevail over all men in _opposition_ to their ideals, and remoulds them according to his own image.

Evil, in this respect, means hard, painful, enforced.

Such men as Napoleon must always return and always settle our belief in the self-glory of the individual afresh: he himself, however, was corrupted by the means he had to stoop to, and had _lost noblesse_ of character. If he had had to prevail among another kind of men, he could have availed himself of other means; and thus it would not seem _necessary_ that a Cæsar _must become bad._

1027.

Man is a combination of the _beast_ and the _super-beast_; higher man a combination of the monster and the superman:[7] these opposites belong to each other. With every degree of a man's growth towards greatness and loftiness, he also grows downwards into the depths and into the terrible: we should not desire the one without the other;--or, better still: the more fundamentally we desire the one, the more completely we shall achieve the other.

[Footnote 7: The play on the German words: "Unthier" and "Überthier," "Unmensch" and "Übermensch," is unfortunately not translatable.--Tr.]

1028.

Terribleness belongs to greatness: let us not deceive ourselves.

1029.

I have taught the knowledge of such terrible things, that all "Epicurean contentment" is impossible concerning them. Dionysian pleasure is the only _adequate_ kind here: _I was the first to discover the tragic._ Thanks to their superficiality in ethics, the Greeks misunderstood it. Resignation is not the lesson of tragedy, but only the misunderstanding of it! The yearning for nonentity is the _denial_ of tragic wisdom, its opposite!

1030.

A rich and powerful soul not only gets over painful and even terrible losses, deprivations, robberies, and insults: it actually leaves such dark infernos in possession of still greater plenitude and power; and, what is most important of all, in possession of an increased blissfulness in love. I believe that he who has divined something of the most fundamental conditions of love, will understand Dante for having written over the door of his Inferno: "I also am the creation of eternal love."

1031.

To have travelled over the whole circumference of the modern soul, and to have sat in all its corners--my ambition, my torment, and my happiness.

Veritably to have _overcome_ pessimism, and, as the result thereof, to have acquired the eyes of a Goethe--full of love and goodwill.

1032.

The first question is by no means whether we are satisfied with ourselves; but whether we are satisfied with anything at all. Granting that we should say yea to any single moment, we have then affirmed not only ourselves, but the whole of existence. For nothing stands by itself, either in us or in other things: and if our soul has vibrated and rung with happiness, like a chord, once only and only once, then all eternity was necessary in order to bring about that one event,--and all eternity, in this single moment of our affirmation, was called good, was saved, justified, and blessed.

1033.

The passions which _say yea._ I ride, happiness, health, the love of the sexes, hostility and war, reverence, beautiful attitudes, manners, strong will, the discipline of lofty spirituality, the will to power, and gratitude to the Earth and to Life: all that is rich, that

would fain bestow, and that refreshes, gilds, immortalises, and deifies Life--the whole power of the virtues that _glorify_--all declaring things good, saying yea, and doing yea.

1034.

We, many or few, who once more dare to live in a world _purged of morality_, we _pagans_ in faith, we are probably also the first who understand what a _pagan faith_ is: to be obliged to imagine higher creatures than man, but to imagine them _beyond_ good and evil; to be compelled to value all higher existence as _immoral_ existence. We believe in Olympus, and _not_ in the "man on the cross."

1035.

The more modern man has exercised his idealising power in regard to a _God_ mostly by _moralising the latter_ ever more and more--what does that mean?--nothing good, a diminution in man's strength.

As a matter of fact, the reverse would be possible: and indications of this are not wanting. God imagined as emancipation from morality, comprising the whole of the abundant assembly of Life's contrasts, and _saving_ and _justifying_ them in a divine agony. God as the beyond, the superior elevation, to the wretched _cul-de-sac_ morality of "Good and Evil."

1036.

A humanitarian God cannot be _demonstrated_ from the world that is known to us: so much are ye driven and forced to conclude to-day. But what conclusion do ye draw from this? "He cannot be demonstrated to _us_": the scepticism of knowledge. You all _fear_ the conclusion: "From the world that is known to us quite a different God would be _demonstrable,_ such a one as would certainly not be humanitarian"--and, in a word, you cling fast to your God, and invent a world for Him which _is unknown to us._

1037.

Let us banish the highest good from our concept of God: it is unworthy of a God. Let us likewise banish the highest wisdom: it is the vanity of philosophers who have perpetrated the absurdity of a God who is a monster of wisdom: the idea was to make Him as like them as possible. No! God _as the highest power_--that is sufficient!--Everything follows from that, even--"the world"!

1038

And how many new Gods are not still possible! I, myself, in whom the religious--that is to say, the god-_creating_ instinct occasionally becomes active at the most inappropriate moments: how very differently the divine has revealed itself every time to me! ... So many strange things have passed before me in those timeless moments, which fall into a man's life as if they came from the moon, and in which he absolutely no longer knows how old he is or how young he still may be! ... I would not doubt that there are several kinds of gods.... Some are not wanting which one could not possibly imagine without a certain halcyonic calm and levity.... Light feet perhaps belong to the concept "God". Is it necessary to explain that a _God_ knows how to hold Himself preferably outside all Philistine and rationalist circles? also (between ourselves) beyond good and evil? His outlook is a _free_ one--as Goethe would say.--And to invoke the authority of Zarathustra, which cannot be too highly appreciated in this regard: Zarathustra goes as far as to confess, "I would only believe in a God who knew how to _dance_ ..."

Again I say: how many new Gods are not still possible! Certainly Zarathustra himself is merely an old atheist: he believes neither in old nor in new gods. Zarathustra says, _"he would"_--but Zarathustra will not.... Take care to understand him well.

The type God conceived according to the type of creative spirits, of "great men."

1039.

And how many new _ideals_ are not, at bottom, still possible? Here is a little ideal that I seize upon every five weeks, while upon a wild and lonely walk, in the azure moment of a blasphemous joy. To spend one's life amid delicate and absurd things; a stranger to reality, half-artist, half-bird, half-metaphysician; without a yea or a nay for reality, save that from time to time one acknowledges it, after the manner of a good dancer, with the tips of one's toes; always tickled by some happy ray of sunlight; relieved and encouraged even by sorrow --for sorrow _preserves_ the happy man; fixing a little tail of jokes even to the most holy thing: this, as is clear, is the ideal of a heavy spirit, a ton in weight _of the spirit of gravity._

1040.

From the military-school of the soul. (Dedicated to the brave, the good-humoured, and the abstinent.)

I should not like to undervalue the amiable virtues; but greatness of soul is not compatible with them. Even in the arts, grand style excludes all merely pleasing qualities.

***

In times of painful tension and vulnerability, choose war. War hardens and develops muscle.

***

Those who have been deeply wounded have the Olympian laughter; a man only has what he needs.

***

It has now already lasted ten years: no sound any longer _reaches_ me--a land without rain. A man must have a vast amount of humanity at his disposal in order not to pine away in such drought.[8]

[Footnote 8: For the benefit of those readers who are not acquainted with the circumstances of Nietzsche's life, it would be as well to point out that this is a purely personal plaint, comprehensible enough in the mouth of one who, like Nietzsche, was for years a lonely anchorite.--Tr.]

1041.

My new road to an affirmative attitude.--Philosophy, as I have understood it and lived it up to the present, is the voluntary quest of the repulsive and atrocious aspects of existence. From the long experience derived from such wandering over ice and desert, I learnt to regard quite differently everything that had been philosophised hitherto: the _concealed_ history of philosophy, the psychology of its great names came into the light for me. "How much truth can a spirit _endure_; for how much truth is it _daring_ enough?"--this for me was the real measure of value. Error is a piece of _cowardice_ ... every victory on the part of knowledge, is the _result_ of courage, of hardness towards one's self, of cleanliness towards one's self.... The kind of _experimental philosophy_ which I am living, even anticipates the possibility of the most fundamental Nihilism, on principle: but by this I do not mean that it remains standing at a negation, at a _no,_ or at a will to negation. It would rather attain to the very reverse--to a _Dionysian affirmation_ of the world, as it is, without subtraction, exception, or choice--it would have eternal circular motion: the same things, the same reasoning, and the same illogical concatenation. The highest state to which a philosopher can attain: to maintain a Dionysian attitude to Life--my formula for this is _amor fati._

To this end we must not only consider those aspects of life which have been denied hitherto, as: _necessary,_ but as desirable, and not only desirable to those aspects which have been affirmed hitherto (as complements or first prerequisites, so to speak), but for their own sake, as the more powerful, more terrible, and more _veritable_ aspects of life, in which the latter's will expresses itself most clearly.

To this end, we must also value that aspect of existence which alone has been affirmed until now; we must understand whence this valuation arises, and to how slight an extent it has to do with a Dionysian valuation of Life: I selected and understood that which in this respect says "yea" (on the one hand, the instinct of the sufferer; on the other, the gregarious instinct; and thirdly, the _instinct of the greater number_ against the exceptions).

Thus I divined to what extent a stronger kind of man must necessarily imagine--the elevation and enhancement of man in another direction: _higher creatures,_ beyond good and evil, beyond those values which bear the stamp of their origin in the sphere of suffering, of the herd, and of the greater number--I searched for the data of this topsy-turvy formation of ideals in history (the concepts "pagan," "classical," "noble," have been discovered afresh and brought forward).

1042.

We should demonstrate to what extent the religion of the Greeks was _higher_ than Judæo-Christianity. The latter triumphed because the Greek religion was degenerate (and decadent).

1043.

It is not surprising that a couple of centuries have been necessary in order to link up again--a couple of centuries are very little indeed.

1044.

There must be some people who sanctify functions, not only eating and drinking, and not only in memory of them, or in harmony with them; but this world must be for ever glorified anew, and in a novel fashion.

1045.

The most intellectual men feel the ecstasy and charm of _sensual_ things in a way which other men --those with "fleshy hearts"--cannot possibly imagine, and ought not to be able to imagine: they are sensualists with the best possible faith, because they grant the senses a more fundamental value than that fine sieve, that thinning and mincing machine, or whatever it is called, which in the language of the people is termed _"spirit"_ The strength and power of the senses--this is the most essential thing in a sound man who is one of Nature's lucky strokes: the splendid beast must first be there--otherwise what is the value of all "humanisation"?

1046.

(1) We want to hold fast to our senses, and to the belief in them--and accept their logical conclusions! The hostility to the senses in the philosophy that has been written up to the present, has been man's greatest feat of nonsense.

(2) The world now extant, on which all earthly and living things have so built themselves, that it now appears as it does (enduring and proceeding slowly), we would fain _continue building_--not criticise it away as false!

(3) Our valuations help in the process of building; they emphasise and accentuate. What does it mean when whole religions say: "Everything is bad and false and evil"? This condemnation of the whole process can only be the judgment of the failures!

(4) True, the failures might be the greatest sufferers and therefore the most subtle! The contented might be worth little!

(5) We must understand the fundamental _artistic_ phenomenon which is called "Life,"--_the formative_ spirit, which constructs under the most unfavourable circumstances: and in the slowest manner possible----The _proof_ of all its combinations must first be given afresh: _it maintains itself._

1047.

Sexuality, lust of dominion, the pleasure derived from appearance and deception, great and joyful gratitude to Life and its typical conditions--these things are essential to all paganism, and it has a good conscience on its side.--_That which is hostile to Nature_ (already in Greek antiquity) combats paganism in the form of morality and dialectics.

1040.

An anti-metaphysical view of the world--yes, but an artistic one.

1049.

Apollo's misapprehension: the eternity of beautiful forms, the aristocratic prescription, "_Thus shall it ever be!_"

Dionysus. Sensuality and cruelty. The perishable nature of existence might be interpreted as the joy of procreative and destructive force, as _unremitting creation._

1050.

The word "_Dionysian_" expresses: a constraint to unity, a soaring above personality, the common-place, society, reality, and above the abyss of the _ephemeral_, the passionately painful sensation of superabundance, in darker, fuller, and more fluctuating conditions; an ecstatic saying of yea to the collective character of existence, as that which remains the same, and equally mighty and blissful throughout all change, the great pantheistic sympathy with pleasure and pain, which declares even the most terrible

and most questionable qualities of existence good, and sanctifies them; the eternal will to procreation, to fruitfulness, and to recurrence; the feeling of unity in regard to the necessity of creating and annihilating.

The word "_Apollonian_" expresses: the constraint to be absolutely isolated, to the typical "individual," to everything that simplifies, distinguishes, and makes strong, salient, definite, and typical to freedom within the law.

The further development of art is just as necessarily bound up with the antagonism of these two natural art-forces, as the further development of mankind is bound up with the antagonism of the sexes. The plenitude of power and restraint, the highest form of self-affirmation in a cool, noble, and reserved kind of beauty: the Apollonianism of the Hellenic will.

This antagonism of the Dionysian and of the Apollonian in the Greek soul, is one of the great riddles which made me feel drawn to the essence of Hellenism. At bottom, I troubled about nothing save the solution of the question, why precisely Greek Apollonianism should have been forced to grow out of a Dionysian soil: the Dionysian Greek had need of being Apollonian; that is to say in order to break his will to the titanic, to the complex, to the uncertain, to the horrible by a will to measure, to simplicity, and to submission to rule and concept. Extravagance, wildness, and Asiatic tendencies lie at the root of the Greeks. Their courage consists in their struggle with their Asiatic nature: they were not given beauty, any more than they were given Logic and moral! naturalness: in them these things are victories, they are willed and fought for--they constitute the _triumph_ of the Greeks.

1051.

It is clear that only the rarest and most lucky cases of humanity can attain to the highest and most sublime human joys in which Life celebrates its own glorification; and this only happens when these rare creatures themselves and their forbears have lived a long preparatory life leading to this goal, without, however, having done so consciously. It is then that an overflowing wealth of multifarious forces and the most agile power of "free will" and lordly command exist together in perfect concord in one man; then the intellect is just as much at ease, or at home, in the senses as the senses are at ease or at home in it; and everything that takes place in the latter must give rise to extraordinarily subtle joys in the former. And _vice versâ:_ just think of this _vice versâ_ for a moment in a man like Hafiz; even Goethe, though to a lesser degree, gives some idea of this process. It is probable that, in such perfect and well-constituted men, the most sensual functions are finally transfigured by a symbolic elatedness of the highest intellectuality; in themselves they feel a kind of _deification of the body_ and are most remote from the ascetic philosophy of the principle "God is a Spirit": from this principle it is clear that the ascetic is the "botched man" who declares only that to be good and "God" which is absolute, and which judges and condemns.

From that height of joy in which man feels himself completely and utterly a deified form and self-justification of nature, down to the joy of healthy peasants and healthy semi-human beasts, the whole of this long and enormous gradation of the light and colour of _happiness_ was called by the Greek--not without that grateful quivering of one who is initiated into secret, not without much caution and pious silence--by the godlike name: _Dionysus._ What then _do_ all modern men--the children of a crumbling, multifarious, sick and strange age _know_ of the _compass_ of Greek happiness, how _could_ they know anything about it! Whence would the slaves of "modern ideas" derive their right to Dionysian feasts!

When the Greek body and soul were in full "bloom," and not, as it were, in states of morbid exaltation and madness, there arose the secret symbol of the loftiest affirmation and transfiguration of life and the world that has ever existed. There we have a _standard_ beside which everything that has grown since must seem too short, too poor, too narrow: if we but pronounce the word "Dionysus" in the presence of the best of more recent names and things, in the presence of Goethe, for instance, or Beethoven, or Shakespeare, or Raphael, in a trice we realise that our best things and moments are _condemned._ Dionysus is a _judge!_ Am I understood? There can be no doubt that the Greeks sought to interpret, by means of their Dionysian experiences, the final mysteries of the "destiny of the soul" and everything they knew concerning the education and the purification of man, and above all concerning the absolute hierarchy and inequality of value between man and man. There is the deepest experience of all Greeks, which they conceal beneath great silence,--_we do not know the Greeks_ so long as this hidden and sub-terranean access to them remains obstructed. The indiscreet eyes of scholars will never perceive anything in these things, however much learned energy may still have to be expended in the service of this excavation--; even the noble zeal of such friends of antiquity as Goethe and Winckelmann, seems to savour somewhat of bad form and of arrogance, precisely in this respect. To wait and to prepare oneself; to await the appearance of new sources of knowledge; to prepare oneself in solitude for the sight of new faces and the sound of new voices; to cleanse one's soul ever more and more of the dust and noise, as of a country fair, which is peculiar to this age; to _overcome_ everything Christian by something super-Christian, and not only to rid oneself of it,--for the Christian doctrine is the

counter-doctrine to the Dionysian; to rediscover the _South_ in oneself, and to stretch a clear, glittering, and mysterious southern sky above one; to reconquer the southern healthiness and concealed power of the soul, once more for oneself; to increase the compass of one's soul step by step, and to become more supernational, more European, more super-European, more Oriental, and finally more _Hellenic_--for Hellenism was, as a matter of fact, the first great union and synthesis of everything Oriental, and precisely on that account, the _beginning_ of the European soul, the discovery of _our "new_ world":--he who lives under such imperatives, who knows what he may not encounter some day? Possibly--a _new dawn!_

1052.

The two types; Dionysus and Christ on the Cross. We should ascertain whether the typically _religious_ man is a decadent phenomenon (the great innovators are one and all morbid and epileptic); but do not let us forget to include that type of the religious man who is _pagan._ Is the pagan cult not a form of gratitude for, and affirmation of, Life? Ought not its most representative type to be an apology and deification of Life? The type of a well-constituted and ecstatically overflowing spirit! The type of a spirit which absorbs the contradictions and problems of existence, and which _solves_ them!

At this point I set up the _Dionysus_ of the Greeks: the religious affirmation of Life, of the whole of Life, not of denied and partial Life (it is typical that in this cult the sexual act awakens ideas of depth, mystery, and reverence).

Dionysus _versus_ "Christ"; here you have the contrast. It is _not_ a difference in regard to the martyrdom,--but the latter has a different meaning. Life itself--Life s eternal fruitfulness and recurrence caused anguish, destruction, and the will to annihilation. In the other case, the suffering of the "Christ as the Innocent One" stands as an objection against Life, it is the formula of Life's condemnation.--Readers will guess that the problem concerns the meaning of suffering; whether a Christian or a tragic meaning be given to it. In the first case it is the road to a holy mode of existence; in the second case _existence itself is regarded as sufficiently holy_ to justify an enormous amount of suffering. The tragic man says yea even to the most excruciating suffering: he is sufficiently strong, rich, and capable of deifying, to be able to do this; the Christian denies even the happy lots on earth: he is weak, poor, and disinherited enough to suffer from life in any form. God on the Cross is a curse upon Life, a signpost directing people to deliver themselves from it;--Dionysus cut into pieces is a _promise_ of Life: it will be for ever born anew, and rise afresh from destruction.

III.

ETERNAL RECURRENCE.

1053.

My philosophy reveals the triumphant thought through which all other systems of thought must ultimately perish. It is the great disciplinary thought: those races that cannot bear it are doomed; those which regard it as the greatest blessing are destined to rule.

1054.

The _greatest_ of all fights: for this purpose a new _weapon_ is required.

A hammer: a terrible alternative must be created. Europe must be brought face to face with the logic of facts, and confronted with the question whether its will for ruin is really earnest.

General levelling down to mediocrity must be avoided. Rather than this it would be preferable to perish.

1055.

A pessimistic attitude of mind and a pessimistic doctrine and ecstatic Nihilism, may in certain circumstances even prove indispensable to the philosopher--that is to say, as a mighty form of pressure, or hammer, with which he can smash up degenerate, perishing races and put them out of existence; with which he can beat a track to a new order of life, or instil a longing for nonentity in those who are degenerate and who desire to perish.

1056.

I wish to teach the thought which gives unto many the right to cancel their existences--the great disciplinary thought.

1057.

_Eternal Recurrence. _ A prophecy.

1. The exposition of the doctrine and its _theoretical_ first principles and results.

2. The proof of the doctrine.

3. Probable results which will follow from its being _believed._ (It makes everything break open.)

_(a)_ The means of enduring it.

_(b)_ The means of ignoring it.

4. Its place in history is a means.

The period _of_ greatest danger. The foundation of an oligarchy _above_ peoples and their interests: education directed at establishing a political policy for humanity in general.

A counterpart of Jesuitism.

1058.

The two greatest philosophical points of view (both discovered by Germans).

(a) That of _becoming_ and that of _evolution._

(b) That based upon the _values of existence_ (but the wretched form of German pessimism must first be overcome!)--

Both points of view reconciled by me in a decisive manner.

Everything becomes and returns for ever, _escape is impossible!_

Granted that we _could_ appraise the value of existence, what would be the result of it? The thought of recurrence is a principle _of selection_ in the service of _power_ (and barbarity!).

The ripeness of man for this thought.

1059.

1. The thought of eternal recurrence: its first principles which must necessarily be true if it were true. What its result is.

2. It is the most _oppressive_ thought: its probable results, provided it be not prevented, that is to say, provided all values be not transvalued.

3. The means of _enduring it:_ the transvaluation of all values. Pleasure no longer to be found in certainty, but in uncertainty; no longer "cause and effect," but continual creativeness; no longer the will to self-preservation, but to power; no longer the modest expression "it is all _only_ subjective," but "it is all _our_ work! let us be proud of it."

1060.

In order to endure the thought of recurrence, freedom from morality is necessary; new means against the _fact pain_ (pain regarded as the instrument, as the father of pleasure; there is no accretive consciousness of pain); pleasure derived from all kinds of uncertainty and tentativeness, as a counterpoise to extreme fatalism; suppression of the concept "necessity"; suppression of the "will"; suppression of "absolute knowledge."

Greatest elevation of man's _consciousness of strength,_ as that which creates superman.

1061.

The two extremes of thought--the materialistic and the platonic--are reconciled in _eternal recurrence_: both are regarded as ideals.

1062.

If the universe had a goal, that goal would have been reached by now. If any sort of unforeseen final state existed, that state also would have! been reached. If it were capable of any halting or stability of any being, it would only have possessed this capability of becoming stable for one instant in its development; and again becoming would have been at an end for ages, and with it all thinking and all "spirit." The fact of "intellects" being in a _state of development_ proves that the universe can have no goal, no final state, and is incapable of being. But the old habit of thinking of some purpose in regard to all phenomena, and of thinking of a directing and creating deity in regard to the universe, is so powerful, that the thinker has to go to great pains in order to avoid thinking of the very aimlessness of the world as intended. The idea that the universe intentionally evades a goal, and even knows artificial means wherewith it prevents itself from falling into a circular movement, must occur to all those who would fain attribute to the universe the capacity of eternally regenerating itself--that is to say, they would fain impose upon a finite, definite force which is invariable in quantity, like the universe, the miraculous gift of renewing its forms and its conditions _for all eternity._ Although the universe is no longer a God, it must still be capable of the divine power of creating and transforming; it must forbid itself to relapse into any one of its previous forms; it must not only have the intention, but also the means, of avoiding any sort of repetition, every second of its existence, even, it must control every single one of its movements, with the view of avoiding goals, final states, and repetitions and all the other results of such an unpardonable and insane method of thought and desire. All this is nothing more than the old religious mode of thought and desire, which, in spite of all, longs to believe that in some way or other the universe resembles the old, beloved, infinite, and infinitely-creative God--that in some way or other "the old God still lives"--that longing of Spinoza's which is expressed in the words "_deus sive natura_" (what he really felt was "_natura sive deus_"). Which, then, is the proposition and belief in which the decisive change, the present _preponderance_ of the scientific spirit over the religious and god-fancying spirit, is best formulated? Ought it not to be: the universe, as force, must not be thought of as unlimited, because it cannot be thought of in this way,--we forbid ourselves the concept _infinite_ force, because it is _incompatible_ with the idea of force? Whence it follows that the universe lacks the power of eternal renewal.

1063.

The principle of the conservation of energy inevitably involves _eternal recurrence._

1064.

That a state of equilibrium has never been reached, proves that it is impossible, but in infinite space it must have been reached. Likewise in spherical space. The _form_ of space must be the cause of the eternal movement, and ultimately of all imperfection. That "energy" and "stability" and "immutability" are contradictory. The measure of energy (dimensionally) is fixed though it is essentially fluid.

"That which is timeless" must be refuted, any given moment of energy, the absolute conditions for a new distribution of all forces are present, it cannot remain stationary. Change is part of its essence, therefore time is as well; by this means, however, the necessity of change has only been established once more in theory.

1065.

A certain emperor always bore the fleeting nature of all things in his mind, in order not to value them too seriously, and to be able to live quietly in their midst. Conversely, everything seems to me much too important for it to be so fleeting, I seek an eternity for everything: ought one to pour the most precious salves and wines into the sea? My consolation is that everything that has been is eternal: the sea will wash it up again.

1066.

The new concept of the universe. The universe exists; it is nothing that grows into existence and that passes out of existence. Or, better still, it develops, it passes away, but it never began to develop, and has never ceased from passing away; it _maintains_ itself in both states. It lives on itself, its excrements are its nourishment.

We need not concern ourselves for one instant with the hypothesis of a _created_ world. The concept create is to-day utterly indefinable and unrealisable; it is but a word which hails from superstitious ages, nothing can be explained with a word. The last attempt that was made to conceive of a world that _began_ occurred quite recently, in many cases with the help of logical

reasoning,--generally, too, as you will guess, with an ulterior theological motive.

Several attempts have been made lately to show that the concept that "the universe has an infinite past (_regressus in infinitum_) is contradictory, it was even demonstrated, it is true, at the price of confounding the head with the tail. Nothing can prevent me from calculating backwards from this moment of time, and of saying: "I shall never reach the end"; just as I can calculate without end in a forward direction, from the same moment. It is only when I wish to commit the error--I shall be careful to avoid it--of reconciling this correct concept of a _regressus in infinitum_ with the absolutely unrealisable concept of a finite _progressus_ up to the present; only when I consider the direction (forwards or backwards) as logically indifferent, that I take hold of the head--this very moment--and think I hold the tail: this pleasure I leave to you, Mr. Dühring!...

I have come across this thought in other thinkers before me, and every time I found that it was determined by other ulterior motives (chiefly theological, in favour of a _creator spiritus)._ If the universe were in any way able to congeal, to dry up, to perish; or if it were capable of attaining to a state of equilibrium; or if it had any kind of goal at all which a long lapse of time, immutability, and finality reserved for it (in short, to speak metaphysically, if becoming could resolve itself into being or into nonentity), this state ought already to have been reached.

But it has not been reached: it therefore follows.... This is the only certainty we can grasp, which can serve as a corrective to a host of cosmic hypotheses possible in themselves. If, for instance, materialism cannot consistently escape the conclusion of a finite state, which William Thomson has traced out for it, then materialism is thereby refuted.

If the universe may be conceived as a definite quantity of energy, as a definite number of centres of energy,--and every other concept remains indefinite and therefore useless,--it follows therefrom that the universe must go through a calculable number of combinations in the great game of chance which constitutes its existence. In infinity, at some moment or other, every possible combination must once have been realised; not only this, but it must have been realised an infinite number of times. And inasmuch as between every one of these combinations and its next recurrence every other possible combination would necessarily have been undergone, and since every one of these combinations would determine the whole series in the same order, a circular movement of absolutely identical series is thus demonstrated: the universe is thus shown to be a circular movement which has already repeated itself an infinite number of times, and which plays its game for all eternity.--This conception is not simply materialistic; for if it were this, it would not involve an infinite recurrence of identical cases, but a finite state. Owing to the fact that the universe has not reached this finite state, materialism shows itself to be but an imperfect and provisional hypothesis.

1067.

And do ye know what "the universe" is to my mind? Shall I show it to you in my mirror? This universe is a monster of energy, without beginning or end; a fixed and brazen quantity o; energy which grows neither bigger nor smaller, which does not consume itself, but only alters its face; as a whole its bulk is immutable, it is a household without either losses or gains, but likewise without increase and without sources of revenue, surrounded by nonentity as by a frontier, it is nothing vague or wasteful, it does not stretch into infinity; but it is a definite quantum of energy located in limited space, and not in space which would be anywhere empty. It is rather energy everywhere, the play of forces and force-waves, at the same time one and many, agglomerating here and diminishing there, a sea of forces storming and raging in itself, for ever changing, for ever rolling back over in calculable ages to recurrence, with an ebb and flow of its forms, producing the most complicated things out of the most simple structures; producing the most ardent, most savage, and most contradictory things out of the quietest, most rigid, and most frozen material, and then returning from multifariousness to uniformity, from the play of contradictions back into the delight of consonance, saying yea unto itself, even in this homogeneity of its courses and ages; for ever blessing itself as something which recurs for all eternity,--a becoming which knows not satiety, or disgust, or weariness:--this, my Dionysian world of eternal self-creation, of eternal self-destruction, this mysterious world of twofold voluptuousness; this, my "Beyond Good and Evil" without aim, unless there is an aim in the bliss of the circle, without will, unless a ring must by nature keep goodwill to itself,--would you have a name for my world? A _solution_ of all your riddles? Do ye also want a light, ye most concealed, strongest and most undaunted men of the blackest midnight?--_This world is the Will to Power--and nothing else!_ And even ye yourselves are this will to power--and nothing besides!

==========

Shakspeare and His Times [Vol. 1 of 2]

Nathan Drake

Project Gutenberg Release: November 28, 2016 · eBook #53625

Transcriber's Notes: Words in italics in the original are surrounded with _underscores_. Words in a Saxon font in the original are surrounded with +plus+ signs. Words in blackletter in the original are surrounded with =equal= signs. Characters superscripted in the original are surrounded by {braces}. Ellipses match the original. In footnotes and attributions, commas and periods seem to be used interchangeably. They remain as printed. Variations in spelling, hyphenation, and accents remain as in the original unless noted. A complete list of corrections follows the text.

SHAKSPEARE

AND

HIS TIMES:

INCLUDING THE BIOGRAPHY OF THE POET; CRITICISMS ON HIS GENIUS AND WRITINGS; A NEW CHRONOLOGY OF HIS PLAYS; A DISQUISITION ON THE OBJECT OF HIS SONNETS; AND A HISTORY OF _THE MANNERS, CUSTOMS, AND AMUSEMENTS, SUPERSTITIONS, POETRY, AND ELEGANT LITERATURE OF HIS AGE_.

BY NATHAN DRAKE, M.D. AUTHOR OF "LITERARY HOURS," AND OF "ESSAYS ON PERIODICAL LITERATURE."

Triumph my Britain! thou hast one to show, To whom all scenes of Europe homage owe.— ————— Soul of the age, The applause, delight, the wonder of our stage, My Shakspeare, rise! BEN JONSON.

The very age and body of the time, his form and pressure. SHAKSPEARE.

IN TWO VOLUMES.

VOL. I.

LONDON: PRINTED FOR T. CADELL AND W. DAVIES, IN THE STRAND. 1817.

Printed by A. Strahan, Printers-Street, London.

PREFACE.

Though two centuries have now elapsed, since the death of Shakspeare, no attempt has hitherto been made to render him the medium for a comprehensive and connected view of the Times in which he lived.

Yet, if any man be allowed to fill a station thus conspicuous and important, Shakspeare has undoubtedly the best claim to the distinction; not only from his pre-eminence as a dramatic poet, but from the intimate relation which his works bear to the manners, customs, superstitions, and amusements of his age.

Struck with the interest which a work of this kind, if properly executed, might possess, the author was induced, several years ago, to commence the undertaking, with the express intention of blending with the detail of manners, &c. such a portion of criticism, biography, and literary history, as should render the whole still more attractive and complete.

In attempting this, it has been his aim to place Shakspeare in the fore-ground of the picture, and to throw around him, in groups more or less distinct and full, the various objects of his design; giving them prominency and light, according to their greater or smaller connection with the principal figure.

More especially has it been his wish, to infuse throughout the whole plan, whether considered in respect to its entire scope, or to the parts of which it is composed, that degree of unity and integrity, of relative proportion and just bearing, without which neither harmony, simplicity, nor effect, can be expected, or produced.

With a view, also, to distinctness and perspicuity of elucidation, the whole has been distributed into three parts or pictures, entitled,—"SHAKSPEARE IN STRATFORD;"—"SHAKSPEARE IN LONDON;"— "SHAKSPEARE IN RETIREMENT;"—which, though inseparably united, as forming but portions of the same story, and harmonized by the same means, have yet, both in subject and execution, a peculiar character to support.

The _first_ represents our Poet in the days of his youth, on the banks of his native Avon, in the midst of rural imagery, occupations, and amusements; in the _second_, we behold him in the capital of his country, in the centre of rivalry and competition, in the active pursuit of reputation and glory; and in the _third_, we accompany the venerated bard to the shades of retirement, to the bosom of domestic peace, to the enjoyment of unsullied fame.

It has, therefore, been the business of the author, in accordancy with his plan, to connect these delineations with their relative accompaniments; to incorporate, for instance, with the first, what he had to relate of the _country_, as it existed in the age of Shakspeare; its manners, customs, and characters; its festivals, diversions, and many of its superstitions; opening and closing the subject with the biography of the poet, and binding the intermediate parts, not only by a perpetual reference to his drama, but by their own constant and direct tendency towards the developement of the one object in view.

With the _second_, which commences with Shakspeare's introduction to the stage as an actor, is combined the poetic, dramatic, and general literature of the times, together with an account of _metropolitan_ manners and diversions, and a full and continued criticism on the poems and plays of our bard.

After a survey, therefore, of the Literary world, under the heads of Bibliography, Philology, Criticism, History, Romantic, and Miscellaneous Literature, follows a View of the Poetry of the same period, succeeded by a critique on the juvenile productions of Shakspeare, and including a biographical sketch of Lord Southampton, and a new hypothesis on the origin and object of the Sonnets.

Of the immediately subsequent description of diversions, &c. the Economy of the Stage forms a leading feature, as preparatory to a History of Dramatic Poetry, previous to the year 1590; and this is again introductory to a discussion concerning the Period when Shakspeare commenced a writer for the theatre; to a new chronology of his plays, and to a criticism on each drama; a department which is interspersed with dissertations on the _fairy mythology_, the _apparitions_, the _witchcraft_, and the _magic_ of Shakspeare; portions of popular credulity which had been, in reference to this distribution, omitted in detailing the superstitions of the country.

This second part is then terminated by a summary of Shakspeare's dramatic character, by a brief view of dramatic poetry during his connection with the stage, and by the biography of the poet to the close of his residence in London.

The _third_ and last of these delineations is, unfortunately, but too short, being altogether occupied with the few circumstances which distinguish the last three years of the life of our bard, with a review of his disposition and moral character, and with some notice of the first tributes paid to his memory.

It will readily be admitted, that the materials for the greater part of this arduous task are abundant; but it must also be granted, that they are dispersed through a vast variety of distant and unconnected departments of literature; and that to draw forth, arrange, and give a luminous disposition to, these masses of scattered intelligence, is an achievement of no slight magnitude, especially when it is considered, that no step in the progress of such an undertaking can be made, independent of a constant recurrence to authorities.

How far the author is qualified for the due execution of his design, remains for the public to decide; but it may, without ostentation, be told, that his leisure, for the last thirty years, has been, in a great decree, devoted to a line of study immediately associated with the subject; and that his attachment to old English literature has led him to a familiarity with the only sources from which, on such a topic, authentic illustration is to be derived.

He will likewise venture to observe, that, in the style of criticism which he has pursued, it has been his object, an ambitious one it is true, to unfold, in a manner more distinct than has hitherto been effected, the peculiar character of the poet's drama; and, lastly, to

produce a work, which, while it may satisfy the poetical antiquary, shall, from the variety, interest, and integrity of its component parts, be equally gratifying to the general reader.

Hadleigh, Suffolk, April 7th, 1817.

CONTENTS

OF

THE FIRST VOLUME.

PART I.

SHAKSPEARE IN STRATFORD.

CHAP. I.

Birth of Shakspeare — Account of his Family — Orthography of his Name. _Page_ 1

CHAP. II.

The House in which Shakspeare was born — Plague at Stratford, June 1564 — Shakspeare educated at the Free-school of Stratford — State of Education, and of Juvenile Literature in the Country at this period — Extent of Shakspeare's acquirements as a Scholar. 21

CHAP. III.

Shakspeare, after leaving School, follows his Father's Trade — Statement of Aubrey — Probably present in his Twelfth Year at Kenelworth, when Elizabeth visited the Earl of Leicester — Tradition of Aubrey concerning him — Whether there is reason to suppose that, after leaving his Father, he was placed in an Attorney's Office, who was likewise Seneschal or Steward of some Manor — Anecdotes of Shakspeare — Allusions in his Works to Barton, Wilnecotte, and Barston, Villages in Warwickshire — Earthquake in 1580 alluded to — Whether, after leaving School, he acquired any Knowledge of the French and Italian languages. 34

CHAP. IV.

Shakspeare married to Anne Hathaway — Account of the Hathaways — Cottage at Shottery — Birth of his eldest Child, Susanna — Hamnet and Judith baptized — Anecdote of Shakspeare — Shakspeare apparently settled in the Country. 59

CHAP. V.

A View of Country-Life during the Age of Shakspeare — Its _Manners and Customs_ — Rural Characters; the Country-Gentleman — the Country-Coxcomb — the Country-Clergyman — the Country-Schoolmaster — the Farmer or Yeoman, his Mode of Living — the Huswife, her Domestic Economy — the Farmer's Heir — the Poor Copyholder — the Downright Clown, or Plain Country-Boor. 68

CHAP. VI.

A View of Country-Life during the Age of Shakspeare — _Manners and Customs continued_ — Rural Holidays and Festivals; New-Year's Day — Twelfth Day — Rock-Day — Plough-Monday — Shrove-tide — Easter-tide — Hock-tide — May-Day — Whitsuntide — Ales; Leet-ale — Lamb-ale — Bride-ale — Clerk-ale — Church-ale — Whitsun-ale — Sheep-shearing Feast — Candlemas-Day — Harvest-Home — Seed-cake Feast — Martinmas — Christmas. 123

CHAP. VII.

A View of Country-Life during the Age of Shakspeare — _Manners and Customs_, continued — Wakes — Fairs — Weddings — Christenings — Burials. 209

CHAP. VIII.

View of Country-Life during the Age of Shakspeare, continued — _Diversions_ — The Itinerant Stage — Cotswold Games — Hawking — Hunting — Fowling — Fishing — Horse-racing — The Quintaine — The Wild-goose Chase — Hurling — Shovel-board — Juvenile Sports — Barley-breake — Parish-Top. 246

CHAP. IX.

View of Country-Life during the Age of Shakspeare, continued — An Account of some of its _Superstitions_; Winter-Night's Conversation — Peculiar Periods devoted to Superstition — St. Paul's Day — St. Swithen's Day — St. Mark's Day — Childermas — St. Valentine's Day — Midsummer-Eve — Michaelmas — All Hallow-Eve — St. Withold — Omens — Charms — Sympathies — Superstitious Cures — Miscellaneous Superstitions. 314

CHAP. X.

Biography of Shakspeare resumed — His Irregularities — Deer-stealing in Sir Thomas Lucy's Park — Account of the Lucy family — Daisy-hill, the Keeper's Lodge, where Shakspeare was confined, on the Charge of stealing Deer — Shakspeare's Revenge — Ballad on Lucy — Severe Prosecution by Sir Thomas — never forgotten by Shakspeare — this Cause, and probably also Debt, as his Father was now in reduced Circumstances, induced him to leave the Country for London about 1586 — Remarks on this Removal. 401

PART II.

SHAKSPEARE IN LONDON.

CHAP. I.

Shakspeare's Arrival in London about the Year 1586, when twenty-two Years of Age — Leaves his Family at Stratford, visiting them occasionally — His Introduction to the Stage — His Merits as an Actor. 413

CHAP. II.

Shakspeare commences a Writer of Poetry, probably about the year 1587, by the composition of his Venus and Adonis — Historical Outline of Polite Literature, during the Age of Shakspeare — General passion for Letters — Bibliography — Shakspeare's Attachment to Books — Philology — Criticism — Shakspeare's Progress in both — History, general, local, and personal, Shakspeare's Acquaintance with — Miscellaneous Literature. 426

CHAP. III.

View of Romantic Literature during the Age of Shakspeare — Shakspeare's Attachment to, and Use of, Romances, Tales, and Ballads. 518

CHAP. IV.

View of Miscellaneous Poetry during the same period. 594

SHAKSPEARE AND HIS TIMES.

PART I.

SHAKSPEARE IN STRATFORD.

CHAPTER I.

BIRTH OF SHAKSPEARE—HIS FAMILY—THE ORTHOGRAPHY OF HIS NAME.

William Shakspeare, the object almost of our idolatry as a dramatic poet, was born at Stratford-upon-Avon, in Warwickshire, on the 23d of April, 1564, and he was baptized on the 26th of the same month.

Of his family, not much that is certain can be recorded; but it would appear, from an instrument in the College of Heralds, confirming the grant of a coat of arms to John Shakspeare in 1599, that his great grandfather had been rewarded by Henry the Seventh, "for his faithefull and approved service, with lands and tenements given to him in those parts of Warwickshire, where," proceeds this document, "they have continued by some descents in good reputation and credit." Notwithstanding this assertion, however, no such grant, after a minute examination, made by Mr. Malone in the chapel of the Rolls, has been discovered; whence we have reason to infer, that the heralds have been mistaken in their statement, and that the bounty of the monarch was directed through a different channel. From the language, indeed, of two rough draughts of a prior grant of arms to John Shakspeare in 1596, it is probable that the service alluded to was of a military cast, for it is there expressly said, that he was rewarded "for his faithful and _valiant_ service," a term, perhaps, implying the heroism of our poet's ancestor in the field of Bosworth.

That the property, thus bestowed upon the family of Shakspeare, descended to John, the father of the poet, and contributed to his influence and respectability, there is no reason to doubt. From the register, indeed, and public writings relating to Stratford, Mr. Rowe has justly inferred, that the Shakspeares were of good figure and fashion there, and were considered as gentlemen. We may presume, however, that the patrimony of Mr. John Shakspeare, the parent of our great dramatist, was not very considerable, as he found the profits of business necessary to his support. He was, in fact, a wool-stapler, and, there is reason to suppose, in a large way; for he was early chosen a member of the corporation of his town, a situation usually connected with respectable circumstances, and soon after, he filled the office of high bailiff or chief magistrate of that body. The record of these promotions has been thus given from the books of the corporation.

"Jan. 10, in the 6th year of the reign of our sovereign lady Queen Elizabeth, John Shakspeare passed his Chamberlain's accounts."

"At the Hall holden the eleventh day of September, in the eleventh year of the reign of our sovereign lady Elizabeth, 1569, were present Mr. John Shakspeare, High Bailiff."[2:A]

It was during the period of his filling this important office, that he first obtained a grant of arms; and, in a note annexed to the subsequent patent of 1596, now in the College of Arms[2:B], it is stated that he was likewise a justice of the peace, and possessed of lands and tenements to the amount of 500_l._ The final confirmation of this grant took place in 1599, in which his shield and coat are described to be, _In a field of gould upon a bend sable, a speare of the first, the poynt upward, hedded argent_; and for his crest or cognisance, _A falcon with his wyngs displayed, standing on a wrethe of his coullers, supporting a speare armed hedded, or steeled sylver_.[3:A]

Mr. John Shakspeare married, though in what year is not accurately known, the daughter and heir of Robert Arden, of Wellingcote, in the county of Warwick, who is termed, in the Grant of Arms of 1596, "a gentleman of worship." The Arden, or Ardern family, appears to have been of considerable antiquity; for, in Fuller's Worthies, Rob. Arden de Bromwich, ar. is among the names of the gentry of this county returned by the commissioners in the twelfth year of King Henry the Sixth, 1433; and in the eleventh and sixteenth years of Elizabeth, A. D. 1562 and 1568, Sim. Ardern, ar. and Edw. Ardrn, ar. are enumerated, by the same author, among the sheriffs of Warwickshire.[3:B] It is well known that the woodland part of this county was formerly denominated Ardern, though, for the sake of euphony, frequently softened towards the close of the sixteenth century, into the smoother appellation of Arden; hence it is not improbable, that the supposition of Mr. Jacob, who reprinted, in 1770, the Tragedy of Arden of Feversham, a play which was originally published in 1592, may be correct; namely that Shakspeare, the poet, was _descended by the female line_ from the unfortunate individual whose tragical death is the subject of this drama; for though the name of this gentleman was originally Ardern, he seems early to have experienced the fate of the county district, and to have had his surname harmonized by a similar omission. In consequence of this marriage, Mr. John Shakspeare and his posterity were allowed, by the College of Heralds, to impale their arms with the ancient arms of the Ardrns of Wellingcote.[3:C]

Of the issue of John Shakspeare by this connection, the accounts are contradictory and perplexed; nor is it absolutely ascertained, whether he had only one wife, or whether he might not have had two, or even three. Mr. Rowe, whose narrative has been usually followed, has given him _ten_ children, among whom he considers _William_ the poet, as the _eldest_ son.[4:A] The Register, however, of the parish of Stratford-upon-Avon, which commences in 1558, is incompatible with this statement; for, we there find _eleven_ children ascribed to John Shakspeare, _ten_ baptized, and _one_, the baptism of which had taken place before the commencement of the Register, buried.[4:B] The dates of these baptisms, and of two or three other events, recorded in this Register, it will be necessary, for the sake of elucidation, to transcribe:

"_Jone_, daughter of John Shakspere, was baptized Sept. 15, 1558.

"_Margaret_, daughter of John Shakspere, was buried April 30, 1563.

"WILLIAM, son of John Shakspere, was baptized April 26, 1564.

"_Gilbert_, son of John Shakspere, was baptized Oct. 3, 1566.

"_Jone_[4:C], daughter of John Shakspere, was baptized April 15, 1569.

"_Anne_, daughter of Mr. John Shakspere, was baptized Sept. 28, 1571.

"_Richard_, son of Mr. John Shakspere, was baptized March 11, 1573-4.

"_Edmund_, son of Mr. John Shakspere, was baptized May 3, 1580.

"_John Shakspere_ and Margery Roberts were married Nov. 25, 1584.

"_Margery_, wife of John Shakspere, was buried Oct. 29, 1587.

"_Ursula_, daughter of John Shakspere, was baptized March 11, 1588.

"_Humphrey_, son of John Shakspere, was baptized May 24, 1590.

"_Philip_, son of John Shakspere, was baptized Sept. 21, 1591.

"Mr. _John Shakspere_ was buried Sept. 8, 1601.

"_Mary Shakspere_, widow, was buried Sept. 9, 1608."

Now it is evident, that if the ten children which were baptized, according to this Register, between the years 1558 and 1591, are to be ascribed to the father of our poet, he must necessarily have had _eleven_, in consequence of the record of the decease of his daughter Margaret. He must also have had three wives, for we find his second wife, Margery, died in 1587, and the death of a third, Mary, a widow, is noticed in 1608.

It was suggested to Mr. Malone[5:A], that very probably, Mr. John Shakspeare had a son born to him, as well as a daughter, before the commencement of the Register, and that this his eldest son, was, as is customary, named after his father, John; a supposition which, (as no other child was baptized by the Christian name of the old gentleman,) carries some credibility with it, and was subsequently acquiesced in by Mr. Malone himself.

In this case, therefore, the marriage recorded in the Register, is that of John Shakspeare the _younger_ with Margery Roberts, and the three children born between 1588 and 1591, Ursula, Humphrey, and Philip, the issue of this John, not by the first, but by a second marriage; for as Margery Shakspeare died in 1587, and Ursula was baptized in 1588-9, these children must have been by the Mary Shakspeare, whose death is mentioned as occurring in 1608, and as she is there denominated a _widow_; the younger John must consequently have died before that date.

The result of _this_ arrangement will be, that the father of our poet had only _nine_ children, and that WILLIAM was not the eldest, but the _second_ son.

On either plan, however, the account of Mr. Rowe is equally inaccurate; and as the introduction of an elder son involves a variety of suppositions, and at the same time nothing improbable is attached to the consideration of this part of the Register in the light in which it usually appears, that is, as allusive solely to the father, it will, we think, be the better and the safer mode, to rely upon it,

according to its more direct and literal import. This determination will be greatly strengthened by reflecting, that old Mr. Shakspeare was, on the authority of the last instrument granting him a coat of arms, living in 1599; that on the testimony of the Register, taken in the common acceptation, he was not buried until September 1601; and that in no part of the same document is the epithet _younger_ annexed to the name of John Shakspeare, a mark of distinction which there is every reason to suppose would have been introduced, had the father and a son of the same Christian name been not only living at the same time in the same town, but the latter likewise a parent.

That the circumstances of Mr. John Shakspeare were, at the period of his marriage, and for several years afterwards, if not affluent, yet easy and respectable, there is every reason to suppose, from his having filled offices of the first trust and importance in his native town; but, from the same authority which has induced us to draw this inference, another of a very different kind, with regard to a subsequent portion of his life, may with equal confidence be taken. In the books of the corporation of Stratford it is stated, that—

"At the hall holden Nov. 19th, in the 21st year of the reign of our sovereign lady Queen Elizabeth, it is ordained, that every Alderman shall be taxed to pay weekly 4_d._, saving _John Shakspeare_ and Robert Bruce, who shall not be taxed to pay any thing; and every burgess to pay 2_d._" Again,

"At the hall holden on the 6th day of September, in the 28th year of our sovereign lady Queen Elizabeth:

"At this hall William Smith and Richard Courte are chosen to be Aldermen in the places of John Wheler and John Shakspeare, for that Mr. Wheler doth desire to be put out of the company, and Mr. Shakspeare doth not come to the halls, when they be warned, nor hath not done of long time."[6:A]

The conclusion to be drawn from these memoranda must unavoidably be, that, in 1579, ten years after he had served the office of High Bailiff, his situation, in a pecuniary light, was so much reduced, that, on this account, he was excused the weekly payment of 4_d._; and that, in 1586, the same distress still subsisting, and perhaps in an aggravated degree, he was, on the plea of non-attendance, dismissed the corporation.

The causes of this unhappy change in his circumstances cannot now, with the exception of the burthen of a large and increasing family, be ascertained; but it is probable, that to this period is to be referred, if there be any truth in the tradition, the report of Aubrey, that "William Shakspeare's father was a butcher." This anecdote, he affirms, was received from the neighbours of the bard, and, on this account, merits some consideration.[7:A]

We are indebted to Mr. Howe for the first intimation concerning the trade of John Shakspeare; his declaration, derived also from tradition, that he was a "considerable dealer in wool," appears confirmed by subsequent research. From a window in a room of the premises which originally formed part of the house at Stratford, in which Shakspeare the poet was born, and a part of which premises has for many years been occupied as a public-house, with the sign of the Swan and Maidenhead, a pane of glass was taken, about five and forty years ago, by Mr. Peyton, the then master of the adjoining Inn called The White Lion. This pane, now in the possession of his son, is nearly six inches in diameter, and perfect, and on it are painted the arms of the merchants of the wool-staple—_Nebule on a chief gules, a lion passant or_. It appears, from the style in which it is finished, to have been executed about the time of Shakspeare, the father, and is undoubtedly a strong corroborative proof of the authenticity of Mr. Rowe's relation.[7:B]

These traditionary anecdotes, though apparently contradictory, may easily admit of reconcilement, if we consider, that between the employment of a wool-dealer, and a butcher, there is no small affinity; "few occupations," observes Mr. Malone, "can be named which are more naturally connected with each other."[8:A] It is highly probable, therefore, that during the period of John Shakspeare's distress, which we know to have existed in 1579, when our poet was but fifteen years of age, he might have had recourse to this more humble trade, as in many circumstances connected with his customary business, and as a great additional means of supporting a very numerous family.

That the necessity for this union, however, did not exist towards the latter part of his life, there is much reason to imagine, both from the increasing reputation and affluence of his son William, and from the fact of his applying to the College of Heralds, in 1596 and 1599, for a grant of arms; events, of which the first, considering the character of the poet, must almost necessarily have led to, and the second directly pre-supposes, the possession of comparative competence and respectability.

The only remaining circumstance which time has spared us, relative to the personal conduct of John Shakspeare, is, that there appears some foundation to believe that, a short time previous to his death, he made a confession of his faith, or spiritual will; a document still in existence, the discovery and history of which, together with the declaration itself, will not improperly find a place at the close of this commencing chapter of our work.

About the year 1770, a master-bricklayer, of the name of Mosely, being employed by Mr. Thomas Hart, the fifth in descent, in a direct line, from the poet's sister, Joan Hart, to new-tile the house in which he then lived, and which is supposed to be that under whose roof the bard was born, found hidden between the rafters and the tiling of the house, a manuscript, consisting of six leaves, stitched together, in the form of a small book. This manuscript Mosely, who bore the character of an honest and industrious man, gave (without asking or receiving any recompense) to Mr. Peyton, an alderman of Stratford; and this gentleman very kindly sent it to Mr. Malone, through the medium of the Rev. Mr. Davenport, vicar of Stratford. It had, however, previous to this transmission, unfortunately been deprived of the first leaf, a deficiency which was afterwards supplied by the discovery, that Mosely, who had now been dead about two years, had copied a great portion of it, and from his transcription the introductory parts were supplied.[9:A] The daughter of Mosely and Mr. Hart, who were both living in the year 1790, agreed in a perfect recollection of the circumstances attending the discovery of this curious document, which consists of the following fourteen articles.

1.

"In the name of God, the Father, Sonne and Holy Ghost, the most holy and blessed Virgin Mary, Mother of God, the holy host of archangels, angels, patriarchs, prophets, evangelists, apostles, saints, martyrs, and all the celestial court and company of heaven: I John Shakspear, an unworthy member of the holy Catholic religion, being at this my present writing in perfect health of body, and sound mind, memory, and understanding, but calling to mind the uncertainty of life and certainty of death, and that I may be possibly cut off in the blossome of my sins, and called to render an account of all my transgressions externally and internally, and that I may be unprepared for the dreadful trial either by sacrament, pennance, fasting, or prayer, or any other purgation whatever, do in the holy presence above specified, of my own free and voluntary accord, make and ordaine this my last spiritual will, testament, confession, protestation, and confession of faith, hopinge hereby to receive pardon for all my sinnes and offences, and thereby to be made partaker of life everlasting, through the only merits of Jesus Christ my saviour and redeemer, who took upon himself the likeness of man, suffered death, and was crucified upon the crosse, for the redemption of sinners.

2.

"_Item_, I John Shakspear doe by this present protest, acknowledge, and confess, that in my past life I have been a most abominable and grievous sinner, and therefore unworthy to be forgiven without a true and sincere repentance for the same. But trusting in the manifold mercies of my blessed Saviour and Redeemer, I am encouraged by relying on his sacred word, to hope for salvation, and be made partaker of his heavenly kingdom, as a member of the celestial company of angels, saints, and martyrs, there to reside for ever and ever in the court of my God.

3.

"_Item_, I John Shakspear doe by this present protest and declare, that as I am certain I must passe out of this transitory life into another that will last to eternity, I do hereby most humbly implore and intreat my good and guardian angell to instruct me in this my solemn preparation, protestation, and confession of faith, at least spiritually, in will adoring and most humbly beseeching my Saviour, that he will be pleased to assist me in so dangerous a voyage, to defend me from the snares and deceites of my infernal enemies, and to conduct me to the secure haven of his eternal blisse.

4.

"_Item_, I John Shakspear doe protest that I will also passe out of this life, armed with the last sacrament of extreme unction: the which if through any let or hindrance I should not then be able to have, I doe now also for that time demand and crave the same; beseeching his Divine Majesty that he will be pleased to anoynt my senses both internall and externall with the sacred oyle of his infinite mercy, and to pardon me all my sins committed by seeing, speaking, feeling, smelling, hearing, touching, or by any other way whatsoever.

5.

"_Item_, I John Shakspear doe by this present protest, that I will never through any temptation whatsoever despaire of the divine goodness, for the multitude and greatness of my sinnes; for which, although I confesse that I have deserved hell, yet will I steadfastly hope in God's infinite mercy, knowing that he hath heretofore pardoned many as great sinners as myself, whereof I have good warrant sealed with his sacred mouth, in holy writ, whereby he pronounceth that he is not come to call the just, but sinners.

6.

"_Item_, I John Shakspear do protest, that I do not know that I have ever done any good worke meritorious of life everlasting: and if I have done any, I do acknowledge that I have done it with a great deale of negligence and imperfection; neither should I have been able to have done the least without the assistance of his divine grace. Wherefore let the devill remain confounded: for I doe in no wise presume to merit heaven by such good workes alone, but through the merits and bloud of my Lord and Saviour Jesus, shed upon the cross for me most miserable sinner.

7.

"_Item_, I John Shakspear do protest by this present writing, that I will patiently endure and suffer all kind of infirmity, sickness, yea, and the paine of death itself: wherein if it should happen, which God forbid, that through violence of paine and agony, or by subtilty of the devill, I should fall into any impatience or temptation of blasphemy, or murmuration against God, or the Catholic faith, or give any signe of bad example, I do henceforth, and for that present, repent me, and am most heartily sorry for the same: and I do renounce all the evill whatsoever, which I might have then done or said; beseeching his divine clemency that he will not forsake me in that grievous and paignefull agony.

8.

"_Item_, I John Shakspear, by virtue of this present testament, I do pardon all the injuries and offences that any one hath ever done unto me, either in my reputation, life, goods, or any other way whatsoever; beseeching sweet Jesus to pardon them for the same; and I do desire that they will doe the like by me whome I have offended or injured in any sort howsoever.

9.

"_Item_, I John Shakspear do here protest, that I do render infinite thanks to his Divine Majesty for all the benefits that I have received, as well secret as manifest, and in particular for the benefit of my creation, redemption, sanctification, conservation, and vocation to the holy knowledge of him and his true Catholic faith: but above all for his so great expectation of me to pennance, when he might most justly have taken me out of this life, when I least thought of it, yea, even then, when I was plunged in the durty puddle of my sinnes. Blessed be therefore and praised, for ever and ever, his infinite patience and charity.

10.

"_Item_, I John Shakspear do protest, that I am willing, yea, I do infinitely desire and humbly crave, that of this my last will and testament the glorious and ever Virgin Mary, mother of God, refuge and advocate of sinners, (whom I honour specially above all saints,) may be the chiefe executresse, togeather with these other saints, my patrons, (Saint Winefride,) all whome I invoke and beseech to be present at the hour of my death, that she and they comfort me with their desired presence, and crave of sweet Jesus that he will receive my soul into peace.

11.

"_Item_, In virtue of this present writing, I John Shakspear do likewise most willingly and with all humility constitute and ordaine my good angell for defender and protector of my soul in the dreadfull day of judgment, when the finall sentence of eternall life or death shall be discussed and given: beseeching him that, as my soule was appointed to his custody and protection when I lived, even so he will vouchsafe to defend the same at that houre, and conduct it to eternall bliss.

12.

"_Item_, I John Shakspear do in like manner pray and beseech all my dear friends, parents, and kinsfolks, by the bowells of our Saviour Jesus Christ, that since it is uncertain what lot will befall me, for fear notwithstanding least by reason of my sinnes I be to

pass and stay a long while in purgatory, they will vouchsafe to assist and succour me with their holy prayers and satisfactory workes, especially with the holy sacrifice of the masse, as being the most effectual means to deliver soules from their torments and paines; from the which, if I shall by God's gracious goodnesse, and by their vertuous workes, be delivered, I do promise that I will not be ungratefull unto them for so great a benefitt.

13.

"_Item_, I John Shakspear doe by this my last will and testament bequeath my soul, as soon as it shall be delivered and loosened from the prison of this my body, to be entombed in the sweet and amorous coffin of the side of Jesus Christ; and that in this life-giving sepulcher it may rest and live, perpetually enclosed in that eternall habitation of repose, there to blesse for ever and ever that direful iron of the launce, which, like a charge in a censore, formes so sweet and pleasant a monument within the sacred breast of my Lord and Saviour.

14.

"_Item_, Lastly I John Shakspear doe protest, that I will willingly accept of death in what manner soever it may befall me, conforming my will unto the will of God; accepting of the same in satisfaction for my sinnes, and giving thanks unto his Divine Majesty for the life he hath bestowed upon me. And if it please him to prolong or shorten the same, blessed be he also a thousand thousand times; into whose most holy hands I commend my soul and body, my life and death: and I beseech him above all things, that he never permit any change to be made by me John Shakspear of this my aforesaid will and testament. Amen.

"I John Shakspeare have made this present writing of protestation, confession, and charter, in presence of the blessed Virgin Mary, my angell guardian, and all the celestial court, as witnesses hereunto: the which my meaning is, that it be of full value now presently and for ever, with the force and vertue of testament, codicill, and donation in course of death; confirming it anew, being in perfect health of soul and body, and signed with mine own hand; carrying also the same about me, and for the better declaration hereof, my will and intention is that it be finally buried with me after my death.

"Pater noster, Ave maria, Credo.

"Jesu, son of David, have mercy on me.—Amen."[14:A]

If the intention of the testator, as expressed in the close of this will, were carried into effect, then, of course, the manuscript which Mosely found, must necessarily have been a copy of that which was buried in the grave of John Shakspeare.

Mr. Malone, to whom, in his edition of Shakspeare, printed in 1790, we are indebted for this singular paper, and for the history attached to it, observes, that he is unable to ascertain, whether it was drawn up by John Shakspeare the father, or by John his _supposed_ eldest son; but he says, "I have taken some pains to ascertain the authenticity of this manuscript, and, after a very careful inquiry, am perfectly satisfied that it is genuine."[15:A] In the "Inquiry," however, which he published in 1796, relative to the Ireland papers, he has given us, though without assigning any reasons for his change of opinion, a very different result: "In my conjecture," he remarks, "concerning the writer of that paper, I certainly was mistaken; for I have since obtained documents that clearly prove it could not have been the composition of any one of our poet's family."[15:B]

In the "Apology" of Mr. George Chalmers "for the Believers in the Shakspeare-Papers," which appeared in the year subsequent to Mr. Malone's "Inquiry," a new light is thrown upon the origin of this confession. "From the sentiment, and the language, this confession appears to be," says this gentleman, "the effusion of a Roman Catholic mind, and was probably drawn up by some Roman Catholic priest.[15:C] If these premises be granted, it will follow, as a fair deduction, that the family of Shakspeare were Roman Catholics; a circumstance this, which is wholly consistent with what Mr. Malone is now studious to inculcate, viz. "that this confession could not have been the composition of any of our poet's family." The thoughts, the language, the orthography, all demonstrate the truth of my conjecture, though Mr. Malone did not perceive this truth, when he first published this paper in 1790. But, it was the performance of a _clerke_, the undoubted work of the family-priest. The conjecture, that Shakspeare's family were Roman Catholics, is strengthened by the fact, that his father declined to attend the corporation meetings, and was at last removed from the corporate body."[16:A]

This conjecture of Mr. Chalmers appears to us in its leading points very plausible; for that the father of our poet might be a Roman Catholic is, if we consider the very unsettled state of his times with regard to religion, not only a possible but a probable supposition: in which case, it would undoubtedly have been the office of the spiritual director of the family to have drawn up such a paper as that

which we have been perusing. It was the fashion also of the period, as Mr. Chalmers has subsequently observed, to draw up confessions of religious faith, a fashion honoured in the observance by the great names of Lord Bacon, Lord Burghley, and Archbishop Parker[16:B]. That he declined, however, attending the corporation-meetings of Stratford from religious motives, and that his removal from that body was the result of non-attendance from _such a cause_, cannot readily be admitted; for we have clearly seen that his defection was owing to pecuniary difficulties; nor is it, in the least degree, probable that, after having honourably filled the highest offices in the corporation without scruple, he should at length, and in a reign too popularly protestant, incur expulsion from an avowed motive of this kind; especially as we have reason to suppose, from the mode in which this profession was concealed, that the tenets of the person whose faith it declares, were cherished in secret.

From an accurate inspection of the hand-writing of this will, Mr. Malone infers that it cannot be attributed to an earlier period than the year 1600[16:C], whence it follows that, if dictated by, or drawn up at the desire of, John Shakspeare, his death soon sealed the confession of his faith; for, according to the register, he was buried on September 8th, 1601.

Such are the very few circumstances which reiterated research has hitherto gleaned relative to the father of our poet; circumstances which, as being intimately connected with the history and character of his son, have acquired an interest of no common nature. Scanty as they must be pronounced, they lead to the conclusion that he was a moral and industrious man; that when fortune favoured him, he was not indolent, but performed the duties of a magistrate with respectability and effect, and that in the hour of adversity he exerted every nerve to support with decency a numerous family.

Before we close this chapter, it may be necessary to state, that the very orthography of the name of Shakspeare has occasioned much dispute. Of Shakspeare the father, no autograph exists; but the _poet_ has left us several, and from these, and from the monumental inscriptions of his family, must the question be decided; the latter, as being of the least authority, we shall briefly mention, as exhibiting, in Dugdale, three varieties,—_Shakespeare_; _Shakespere_, and _Shakspeare_. The former present us with _five_ specimens which, singular as it may appear, all vary, either in the mode of writing, or mode of spelling. The first is annexed to a mortgage executed by the poet in 1613, and appears thus, _W{m} Shakspe{a}_: the second is from a deed of bargain and sale, relative to the same transaction, and of the same period, and signed, _William Shaksper■_: the third, fourth, and fifth are taken from the _Will_ of Shakspeare executed in March 1616, consisting of three _briefs_ or sheets, to each of which his name is subscribed. These signatures, it is remarkable, differ considerably, especially in the surnames; for in the first brief we find _William Shackspere_; in the second, _Willm Shakspe re_, and in the third, _William Shakspeare_. It has been supposed, however, that, according to the practice in Shakspeare's time, the name in the first sheet was written by the scrivener who drew the will.

In the year 1790, Mr. Malone, from an inspection of the mortgage, pronounced the genuine orthography to be _Shakspeare_[17:A]; in 1796, from consulting the deed of sale, he altered his opinion, and declared that the poet's own mode of spelling his name was, beyond a possibility of doubt, that of _Shakspere_, though for reasons which he should assign in a subsequent publication, he should still continue to write the name _Shakspeare_.[18:A]

To this decision, relative to the genuine orthography, Mr. Chalmers cannot accede; and for this reason, that, "when the testator subscribed his name, for the _last time_, he _plainly_ wrote Shakspe_a_re."[18:B]

It is obvious, therefore, that the controversy turns upon, whether there be, or be not, an _a_ introduced in the second syllable of the last signature of the poet. Mr. Malone, on the suggestion of an anonymous correspondent, thinks that there is not, this gentleman having clearly shown him, "that though there was a superfluous stroke when the poet came to write the letter _r_ in his last signature, probably from the tremor of his hand, there was no _a_ discoverable in that syllable; and that this name, like both the other, was written _Shakspere_."[18:C]

From the annexed plate of autographs, which is copied from Mr. Chalmers's Apology, and presents us with very perfect fac-similes of the signatures, it is at once evident, that the assertion of the anonymous correspondent, that the last signature, "_like both the other_, was written Shakspere," cannot be correct; for the surname in the first brief is written Sha_c_kspere, and, in the second, Shakspe re. Now the _hiatus_ in this second signature is unaccounted for in the fac-simile given by Mr. Malone[18:D]; but in the plate of Mr. Chalmers it is found to have been occasioned by the intrusion of the word _the_ of the _preceding line_, a circumstance which, very probably, might prevent the introduction of the controverted letter. It is likewise, we think, very evident that something more than _a superfluous stroke_ exists between the _e_ and _r_ of the last signature, and that the variation is, indeed, too material to have originated from any supposed tremor of the hand.

Upon the whole, it may, we imagine, be safely reposed on as a fact, that Shakspeare was not uniform in the orthography of his own name; that he sometimes spelt it _Shakspere_ and sometimes _Shakspeare_; but that no other variation is extant which can claim a similar authority.[19:A] It is, therefore, nearly a matter of indifference which of _these two_ modes of spelling we adopt; yet, as his last signature appears to have included the letter _a_, it may, for the sake of consistency, be proper silently to acquiesce in its admission.

FOOTNOTES:

[2:A] Communicated to Mr. Malone by the Rev. Mr. Davenport, vicar of Stratford-upon-Avon.

[18:C] Malone's Inquiry, p. 117, 118.

[18:D] Inquiry, Plate II. No. 12.

[19:A] A want of uniformity in the spelling of names, was a species of negligence very common in the time of Shakspeare, and may be observed, remarks Mr. Chalmers, "with regard to the principal poets of that age; as we may see in _England's Parnassus_, a collection of poetry which was published in 1600: thus,

S_y_dney S_i_dney. Spen_s_er Spen_c_er. Jonson Johnson Jhonson. Dekker Dekkar. Markeham Markham. Sylv_i_ster Sylv_e_ster S_i_lvester. Sackwill Sackuil. Fitz Geffrey Fitzjeffry Fitz Jeffr_a_y. France Fraunce. Mid_l_eton Mid_d_leton. G_u_ilpin G_i_lpin. Achelly Achely Achilly Achillye. Dra_y_ton Dra_i_ton. Danie_l_ Daniel_l_. Dav_i_s Davi_e_s. Marlo_w_ Marlo_we_. M_a_rston M_u_rston. Fair_e_fax Fa_ir_fax. K_i_d K_y_d.

Yet, it is remarkable, that in this collection of diversities, our dramatist's name is uniformly spelt Shakespeare: in whatever manner this celebrated name may have been pronounced in Warwickshire, it certainly was spoken in London, with the _e_ soft, thus, Shak_e_speare: in the registers of the Stationers' Company, it is written, Shakes_pere_, and Shakes_peare_." Chalmers's Supplemental Apology, p. 129, 130.

A curious proof of the uncertain orthography of the poet's surname among his contemporaries and immediate successors, may be drawn from a pamphlet, entitled, "The great Assizes holden in Parnassus by Apollo and his Assessours: at which Sessions are arraigned, Mercurius Britannicus, &c. &c. London: Printed by Richard Cotes for Edward Husbands, and are to be sold at his shop in the Middle Temple. 1645. qto. 25 leaves."

In this rare tract, among the list of the jurors is found the name of our bard, written William _Shakespeere_; and in the body of the poem, it is given _Shakespeare_, and _Shakespear_. _Vide_ British Bibliographer, vol. i. p. 513.

CHAPTER II.

THE HOUSE IN WHICH SHAKSPEARE WAS BORN—PLAGUE AT STRATFORD, JUNE 1564—SHAKSPEARE EDUCATED AT THE FREE-SCHOOL OF STRATFORD—STATE OF EDUCATION, AND OF JUVENILE LITERATURE IN THE COUNTRY AT THIS PERIOD—EXTENT OF SHAKSPEARE'S ACQUIREMENTS AS A SCHOLAR.

The experience of the last half century has fully proved, that every thing relative to the history of our immortal dramatist has been received, and received justly too, by the public with an avidity proportional to his increasing fame. What, if recorded of a less celebrated character, might be deemed very uninteresting, immediately acquires, when attached to the mighty name of Shakspeare, an importance nearly unparalleled. No apology, therefore, can be necessary for the introduction of any fact or circumstance, however minute, which is, in the slightest degree, connected with his biography; tradition, indeed, has been so sparing of her communications on this subject, that every addition to her little store has been hitherto welcomed with the most lively sensation of pleasure, nor will the attempt to collect and embody these scattered fragments be unattended with its reward.

The birth-place of our poet, the spot where he drew the first breath of life, where Fancy

—— "fed the little prattler, and with songs Oft sooth'd his wond'ring ears,"

has been the object of laudable curiosity to thousands, and happily the very roof that sheltered his infant innocence can still be pointed out. It stands in Henley-street, and, though at present forming two separate tenements, was originally but one house.[21:A] The premises are still in possession of the Hart family, _now_ the _seventh_ descendants, in a direct line, from Jone the sister of the poet. From the plate in Reed's Shakspeare, which is a correct representation of the existing state of this humble but interesting dwelling, it will appear, that one portion of it is occupied by the Swan and Maidenhead public-house, and the other by a butcher's shop, in which the son of old Mr. Thomas Hart, mentioned in the last chapter, still carries on his father's trade.[22:A] "The kitchen of this house," says Mr. Samuel Ireland, "has an appearance sufficiently interesting, abstracted from its claim to notice as relative to the Bard. It is a subject very similar to those that so frequently employed the rare talents of Ostade, and therefore cannot be deemed unworthy the pencil of an inferior artist. In the corner of the chimney stood an old oak-chair, which had for a number of

years received nearly as many adorers as the celebrated shrine of the Lady of Loretto. This relic was purchased, in July 1790, by the Princess Czartoryska, who made a journey to this place, in order to obtain intelligence relative to Shakspeare; and being told he had often sat in this chair, she placed herself in it, and expressed an ardent wish to become a purchaser; but being informed that it was not to be sold at any price, she left a handsome gratuity to old Mrs. Hart, and left the place with apparent regret. About four months after, the anxiety of the Princess could no longer be withheld, and her secretary was dispatched express, as the fit agent, to purchase this treasure at any rate: the sum of twenty guineas was the price fixed on, and the secretary and chair, with a proper certificate of its authenticity on stamped paper, set off in a chaise for London."[23:A] The elder Mr. Hart, who died about the year 1794, aged sixty-seven, informed Mr. Samuel Ireland, that he well remembered, when a boy, having dressed himself, with some of his playfellows, as Scaramouches (such was his phrase), in the wearing-apparel of Shakspeare; an anecdote of which, if we consider the lapse of time, it may be allowed us to doubt the credibility, and to conclude that the recollection of Mr. Hart had deceived him.

Little more than two months had passed over the head of the infant Shakspeare, when he became exposed to danger of such an imminent kind, that we have reason to rejoice he was not snatched from us even while he lay in the cradle. He was born, as we have already recorded, on the 23d of April, 1564; and on the 30th of the June following, the plague broke out at Stratford, the ravages of which dreadful disease were so violent, that between this last date and the close of December, not less than two hundred and thirty-eight persons perished; "of which number," remarks Mr. Malone, "probably two hundred and sixteen died of that malignant distemper; and one only of the whole number resided, not in Stratford, but in the neighbouring town of Welcombe. From the two hundred and thirty-seven inhabitants of Stratford, whose names appear in the Register, twenty-one are to be subducted, who, it may be presumed, would have died in six months, in the ordinary course of nature; for in the five preceding years, reckoning, according to the style of that time, from March 25. 1559, to March 25. 1564, two hundred and twenty-one persons were buried at Stratford, of whom two hundred and ten were townsmen: that is, of these latter, forty-two died each year at an average. Supposing one in thirty-five to have died annually, the total number of the inhabitants of Stratford at that period was one thousand four hundred and seventy; and consequently the plague, in the last six months of the year 1564, carried off more than a seventh part of them. Fortunately for mankind it did not reach the house in which the infant Shakspeare lay; for not one of that name appears in the dead list. May we suppose, that, like Horace, he lay secure and fearless in the midst of contagion and death, protected by the Muses, to whom his future life was to be devoted, and covered over:—

———————— "_sacrâ Lauroque, collataque myrto, Non sine Diis animosus infans_."[24:A]

It is now impossible to ascertain with any degree of certainty the mode which was adopted in the education of this aspiring genius; all that time has left us on the subject is, that he was sent, though but for a short period, to the free-school of Stratford, a seminary founded in the reign of Henry the Sixth, by the Rev. —— Jolepe, M. A., a native of the town; and which, after sharing, at the general dissolution of chantries, religious houses, &c. the usual fate, was restored and patronised by Edward the Sixth, a short time previous to his death. Here it was, that he acquired the _small Latin and less Greek_, which Jonson has attributed to him, a mode of phraseology from which it must be inferred, that he was at _least acquainted_ with _both_ languages; and, perhaps, we may add, that he who has obtained some knowledge of Greek, however slight, may, with little hesitation, be supposed to have proceeded considerably beyond the limits of mere elementary instruction in Latin.

At the period when Shakspeare was sent to school, the study of the classical languages had made, since the era of the revival of literature, a very rapid progress. Grammars and Dictionaries, by various authors, had been published[25:A]; but the grammatical institute then in general use, both in town and country, was the Grammar of Henry the Eighth, which, by the order of Queen Elizabeth, in her Injunctions of 1559, was admitted, to the exclusion of all others: "Every schoolmaster," says the thirty-ninth Injunction, "shall teach the grammar set forth by King Henrie the Eighth, of noble memorie, and continued in the time of Edward the Sixth, and _none other_;" and in the Booke of certain Cannons, 1571, it is again directed, "that no other grammar shall be taught, but only that which the Queen's Majestie hath commanded to be read in all schooles, through the whole realm."

With the exception of Wolsey's _Rudimenta Grammatices_, printed in 1536, and taught in his school at Ipswich, and a similar work of Collet's, established in his seminary in St. Paul's churchyard, this was the grammar publicly and universally adopted, and without doubt the instructor of Shakspeare in the language of Rome.

Another initiatory work, which we may almost confidently affirm him to have studied under the tuition of the master of the free-school at Stratford, was the production of one Ockland, and entitled EIPHNAPXIA, _sive_ ELIZABETHA. The object of this book, which is written in Latin verse, is to panegyrise the characters and government of Elizabeth and her ministers, and it was,

therefore, enjoined by authority to be read as a classic in every grammar-school, and to be indelibly impressed upon the memory of every young scholar in the kingdom; "a matchless contrivance," remarks Bishop Hurd, "to imprint a sense of loyalty on the minds of the people."[26:A]

To these school-books, to which, being introduced by compulsory edicts, there is no doubt Shakspeare was indebted for some learning and much loyalty, may be added, as another resource to which he was directed by his master, the Dictionary of Syr Thomas Elliot, declaring Latin by English, as greatly improved and enriched by Thomas Cooper in 1552. This lexicon, the most copious and celebrated of its day, was received into almost every school, and underwent numerous editions, namely, in 1559, and in 1565, under the title of _Thesaurus Linguæ Romanæ et Britannicæ_, and again in 1573, 1578, and 1584. Elizabeth not only recommended the lexicon of Cooper, and professed the highest esteem for him, in consequence of the great utility of his work toward the promotion of classical literature, but she more substantially expressed her opinion of his worth by promoting him to the deanery of Gloucester in 1569, and to the bishoprics of Lincoln and Winchester in 1570 and 1584, at which latter see he died on the 29th of April, 1594.[27:A]

Thus far we may be allowed, on good grounds, to trace the very books which were placed in the hands of Shakspeare, during his short noviciate in classical learning; to proceed farther, would be to indulge in mere conjecture, but we may add, and with every just reason for the inference, that from these productions, and from the few minor classics which he had time to study at this seminary, all that the most precocious genius, at such a period of life, and under so transient a direction of the mind to classic lore, could acquire, was obtained.[27:B]

The universality of classical education about the era of 1575, when, it is probable, Shakspeare had not long entered on the acquisitions of the Latin elements, was such that no person of rank or property could be deemed accomplished who had not been thoroughly imbued with the learning and mythology of Greece and Rome. The knowledge which had been previously confined to the clergy or professed scholars, became now diffused among the nobility and gentry, and even influenced, in a considerable degree, the minds and manners of the softer sex. Elizabeth herself led the way in this career of erudition, and she was soon followed by the ladies of her court, who were taught, as Warton observes, not only to distil strong waters, but to construe Greek.[28:A]

The fashion of the court speedily became, to a certain extent, the fashion of the country, and every individual possessed of a decent competency, was solicitous that his children should acquire the literature in vogue. Had the father of our poet continued in prosperous circumstances, there is every reason to conclude that his son would have had the opportunity of acquiring the customary erudition of the times; but we have already seen, that in 1579 he was so reduced in fortune, as to be excused a weekly payment of 4_d._, a state of depression which had no doubt existed some time before it attracted the notice of the corporation of Stratford.

One result therefore of these pecuniary difficulties was the removal of young Shakspeare from the free-school, an event which has occasioned, among his biographers and numerous commentators, much controversy and conjecture as to the extent of his classical attainments.

From the short period which tradition allows us to suppose that our poet continued under the instruction of a master, we have a right to conclude that, notwithstanding his genius and industry, he must necessarily have made a very superficial acquaintance with the learned languages. That he was called home to assist his father, we are told by Mr. Rowe; and consequently, as the family was numerous and under the pressure of poverty, it is not likely that he found much time to prosecute what he had commenced at school. The accounts, therefore, which have descended to us, on the authority of Ben Jonson, Drayton, Suckling, &c. that he had not much learning, that he depended almost exclusively on his _native_ genius, (_that his Latin was small and his Greek less_,) ought to have been, without scruple, admitted. Fuller, who was a diligent and accurate enquirer, has given us in his Worthies, printed in 1662, the most full and express opinion on the subject. "He was an eminent instance," he remarks, "of the truth of that rule, _Poeta non fit, sed nascitur_; one is not _made_ but _born_ a poet. Indeed his learning was _very little_, so that as _Cornish diamonds_ are not polished by any lapidary, but are pointed and smoothed even as they are taken out of the earth, so _nature_ itself was all the _art_ which was used upon him."[29:A]

Notwithstanding this uniform assertion of the contemporaries and immediate successors of Shakspeare, relative to his very imperfect knowledge of the languages of Greece and Rome, many of his modern commentators have strenuously insisted upon his intimacy with both, among whom may be enumerated, as the most zealous and decided on this point, the names of Gildon, Sewell,

Pope, Upton, Grey, and Whalley. The dispute, however, has been nearly, if not altogether terminated, by the _Essay_ of Dr. Farmer _on the Learning of Shakspeare_, who has, by a mode of research equally ingenious and convincing, clearly proved that all the passages which had been triumphantly brought forward as instances of the classical literature of Shakspeare, were taken from translations, or from original, and once popular, productions in his native tongue. Yet the _conclusion_ drawn from this essay, so far as it respects the portion of latinity which our poet had acquired and preserved, as the result of his school-education, appears to us greatly too restricted. "_He remembered_," says the Doctor, "_perhaps enough of his school-boy learning to put the Hig, hag, hog, into the mouth of Sir Hugh Evans_:" and might pick up in the writers of the time, or the course of his conversation, a familiar phrase or two of French or Italian: but his studies were most demonstratively confined to nature and his own language.[30:A]

A very late writer, in combating this part of the _conclusion_ of Dr. Farmer, has advanced an opinion in several respects so similar to our own, that it will be necessary, in justice to him and previous to any further expansion of the idea which we have embraced, to quote his words. "Notwithstanding," says he, "Dr. Farmer's essay on the deficiency of Shakspeare in learning, I must acknowledge myself to be one who does not conceive that his proofs of that fact sufficiently warrant his conclusions from them: 'that his _studies_ were demonstrably confined to nature and his own language' is, as Dr. Farmer concludes, true enough; but when it is added, 'that he only picked up in conversation a familiar phrase or two of French, or remembered enough of his school-boy's learning to put _hig, hag, hog_, in the mouths of others:' he seems to me to go beyond any evidence produced by him of so little knowledge of languages in Shakspeare. He proves indeed sufficiently, that Shakspeare chiefly read English books, by his copying sometimes minutely the very errors made in them, many of which he might have corrected, if he had consulted the original Latin books made use of by those writers: but this does not prove that he was not able to read Latin well enough to examine those originals if he chose; it only proves his indolence and indifference about accuracy in minute articles of no importance to the chief object in view of supplying himself with subjects for dramatic compositions. Do we not every day meet with numberless instances of similar and much greater oversights by persons well skilled in Greek as well as Latin, and professed critics also of the writings and abilities of others? If Shakspeare made an ignorant man pronounce the French word _bras_ like the English _brass_, and evidently on purpose, as being a probable mistake by such an unlearned speaker; has not one learned modern in writing Latin made _Paginibus_ of _Paginis_, and another mentioned a person as being born in the reign of Charles the First, and yet as dying in 1600, full twenty-five years before the accession of that king? Such mistakes arise not from ignorance, but a heedless inattention, while their thoughts are better occupied with more important subjects; as those of Shakspeare were with forming his plots and his characters, instead of examining critically a great Greek volume to see whether he ought to write _on this side of Tiber or on that side of Tiber_; which however very possibly he might not be able to read; but Latin was more universally learnt in that age, and even by women, many of whom could both write and speak it; therefore it is not likely that he should be so very deficient in that language, as some would persuade us, by evidence which does not amount to sufficient proofs of the fact. Nay, even although he had a sufficiency of Latin to understand any Latin book, if he chose to do it, yet how many in modern times, under the same circumstances, are led by mere indolence to prefer translations of them, in case they cannot read Latin with such perfect ease, as never to be at a loss for the meaning of a word, so as to be forced to read some sentences twice over before they can understand them rightly. That Shakspeare was not an eminent Latin scholar may be very true, but that he was so totally ignorant as to know nothing more than _hic, hæc, hoc_, must have better proofs before I can be convinced."[31:A]

The truth seems to be, that Shakspeare, like most boys who have spent but two or three years at a grammar-school, acquired just as much Latin as would enable him, with the assistance of a lexicon, and no little share of assiduity, to construe a minor classic; a degree of acquisition which we every day see, unless forwarded by much leisure and much private industry, immediately becomes stationary, and soon retrograde. Our poet, when taken from the free-school of Stratford, had not only to direct his attention to business, in order to assist in warding off from his father's family the menacing approach of poverty; but it is likewise probable that his leisure, as we shall notice more at large in the next chapter, was engaged in other acquisitions; and when at a subsequent period, and after he had become a married man, his efforts were thrown into a channel perfectly congenial to his taste and talents, still to procure subsistence for the day was the immediate stimulus to exertion. Under these circumstances, and when we likewise recollect that _popular_ favour and applause were essential to his success, and that nearly to the last period of his life he was a prolific caterer for the public in a species of poetry which called for no recondite or learned resources, it is not probable, nay, it is, indeed, scarcely possible, that he should have had time to cultivate and increase his classical attainments, originally and necessarily superficial. To translations, therefore, and to popular and legendary lore, he was alike directed by policy, by inclination, and by want of leisure; yet must we still agree, that, had a proficiency in the learned languages been necessary to his career, the means resided within himself, and that, on the basis merely of his school-education, although limited as we have seen it, he might, had he early and steadily directed his attention to the subject, have built the reputation of a scholar.

That the powers, however, of his vast and capacious mind, especially if we consider the shortness of his life, were not expended on such an attempt, we have reason to rejoice; for though his attainments, as a linguist, were truly trifling, yet his _knowledge_ was great, and his _learning_, in the best sense of the term, that is, as distinct from the mere acquisition of language, multifarious, and extensive beyond that of most of his contemporaries.[32:A]

It is, therefore, to his _English_ studies that we must have recourse for a due estimate of his reading and research; a subject which will be treated of in a future portion of the work.

FOOTNOTES:

[21:A] It is with some apprehension of imposition that I quote the following passage from Mr. Samuel Ireland's Picturesque Views on the River Avon. This gentleman, the father of the youth who endeavoured so grossly to deceive the public by the fabrication of a large mass of MSS. which he attributed to Shakspeare, was undoubtedly, at the time he wrote this book, the complete dupe of his son; and though, as a man of veracity and integrity, to be depended upon with regard to what originated from himself, it is possible, that the settlement which he quotes may have been derived from the same ample store-house of forgery which produced the folio volume of miscellaneous papers, &c. This settlement, in the possession of Mr. Ireland, is brought forward as a proof that the premises in Henley-street were certainly in the occupation of John Shakspeare, the father of the poet; it is dated August 14th, thirty-third of Elizabeth, 1591, and Mr. Ireland professes to give the substance of it in the subsequent terms:—"'That George Badger, senior, of Stratford upon Avon, conveys to John and William Courte, yeomen, and their heirs, in trust, &c. a messuage or tenement, with the appurtenances, in Stratford upon Avon, in a certain streete called Henley-streete, between the house of Robert Johnson on the one part, and the house of _John Shakspeare_ on the other; and also two selions (_i. e._ ridges, or ground between furrows) of land lying between the land of _Thomas Combe_, Gent. on the one hand, and Thomas Reynolde, Gent. on the other.' It is regularly executed, and livery of seisin on the 29th of the same month and year indorsed." _P._ 195, 196.

[22:A] "In a lower room of this public house," says Mr. Samuel Ireland, "which is part of the premises wherein Shakspeare was born, is a curious antient ornament over the chimney, relieved in plaister, which, from the date, 1606, that was originally marked on it, was probably put up at the time, and possibly by the poet himself: although a rude attempt at historic representation, I have yet thought it worth copying, as it has, I believe, passed unnoticed by the multitude of visitors that have been on this spot, or at least has never been made public: and to me it was enough that it held a conspicuous place in the dwelling-house of one who is himself the ornament and pride of the island he inhabited. In 1759, it was repaired and painted in a variety of colours by the old Mr. Thomas Harte before-mentioned, who assured me the motto then round it had been in the old black letter, and dated 1606. The motto runs thus:

=Golith comes with sword and spear, And David with a sling: Although Golith rage and sweare, Down David doth him bring.=" Picturesque Views, p. 192, 193.

[23:A] Picturesque Views, p. 189, 190. It is probable that Mr. Ireland, though, it appears, unconnected with the forgeries of his son, might, during his tour, be too eager in crediting the tales which were told him. One Jordan, a native of Alverton near Stratford, was for many years the usual _cicerone_ to enquirers after Shakspeare, and was esteemed not very accurate in weighing the authenticity of the anecdotes which he related.

[24:A] Reed's Shakspeare, vol. i. p. 84, 85.

[25:A] It is possible also that the following grammars and dictionaries, independent of those mentioned in the text, may have contributed to the school-education of Shakspeare:—

1. Certain brief Rules of the Regiment or Construction of the Eight Partes of Speche, in English and Latin, 1537.

2. A short Introduction of Grammar, generallie to be used: compiled and set forth, for the bringyng up of all those that intend to attaine the knowledge of the Latin tongue, 1557.

3. The Scholemaster; or, Plaine and perfite Way of teaching Children to understand, write, and speak, the Latin Tong. By Roger Ascham. 1571.

4. Abecedarium Anglico-Latinum, pro tyrunculis, Ricardo Huloeto exscriptore, 1552.

5. The Short Dictionary, 1558.

6. A little Dictionary; compiled by J. Withals, 1559. Afterwards reprinted in 1568, 1572, 1579, and 1599; and entitled, A Shorte Dictionarie most profitable for young Beginners: and subsequently, A Shorte Dictionarie in Lat. and English.

7. The brefe Dyxcyonary, 1562.

8. Huloets Dictionary; newlye corrected, amended, and enlarged, by John Higgins, 1572.

9. Veron's Dictionary; Latin and English, 1575.

10. An Alvearie, or Quadruple Dictionarie; containing foure sundrie Tongues: namelie, English, Latine, Greeke, and Frenche. Newlie enriched with varietie of wordes, phrases, proverbs, and divers lightsome observations of grammar. By John Baret, 1580.

11. Rider's Dictionary, Latine, and English, 1589.

[26:A] Moral and Political Dialogues, vol. ii. p. 28. edit. 1788.

[27:A] That school-masters and lexicographers were not usually so well rewarded, notwithstanding the high value placed on classical literature at this period, may be drawn from the complaint of Ascham: "It is pitie," says he, "that commonlie more care is had, yea, and that amonge verie wise men, to find out rather a cunnynge man for their horse, than a cunnynge man for their children. They say nay in worde, but they do so in deede. For, to the one they will gladlie give a stipend of 200 crownes by yeare, and loth to offer to the other 200 shillings. God, that sitteth in heaven, laugheth their choice to skorne, and rewardeth their liberalitie as it should; for he suffereth them to have tame, and well ordered horse, but wilde and unfortunate children; and therefore, in the ende, they finde more pleasure in their horse than comforte in their children."—Ascham's Works, Bennet's edition, p. 212.

[27:B] It is more than possible that the Eclogues of Mantuanus the Carmelite may have been one of the school-books of Shakspeare. He is familiarly quoted and praised in the following passage from Love's Labour's Lost:—

"Hol. _Fauste, precor gelidâ quando pecus omne sub umbrâ Ruminat_,—and so forth. Ah, good old Mantua! I may speak of thee as the traveller doth of Venice:

——— _Vinegia, Vinegia, Chi non te rede, ci non te pregia._

Old Mantuan! old Mantuan! who understandeth thee not, loves thee not." Act iv. sc. 2. And his Eclogues, be it remembered, were translated and printed, together with the Latin on the opposite page, for the use of schools, before the commencement of our author's education; and from a passage quoted by Mr. Malone, from Nashe's _Apologie of Pierce Penniless_, 1593, appear to have continued in use long after its termination. "With the first and second leafe, he plaies very prettilie, and, in ordinarie terms of extenuating, verdits Pierce Pennilesse for a grammar-school wit; saies, his margine is as deeply learned as, _Fauste, precor gelidâ_." Mantuanus was translated by George Turberville in 1567, and reprinted in 1591.—_Vide_ Reed's Shakspeare, vol. vii. p. 95.

[29:A] Worthies, p. iii. p. 126.

[30:A] Reed's Shakspeare, vol. ii. p. 85.

[31:A] Censura Literaria, vol. ix. p. 285.

[32:A] "If it were asked from what sources," observes Mr. Capel Lofft, "_Shakspeare_ drew these abundant streams of wisdom, carrying with their current the fairest and most unfading flowers of poetry, I should be tempted to say, he had what would be now considered a very reasonable portion of Latin; he was not wholly ignorant of Greek; he had a knowledge of the French, so as to read it with ease; and I believe not less of the Italian. He was habitually conversant in the chronicles of his country. He lived with wise and highly cultivated men; with Jonson, Essex, and Southampton, in familiar friendship. He had deeply imbibed the Scriptures. And his own most acute, profound, active, and original genius (for there never was a truly great poet, nor an aphoristic writer of excellence without these accompanying qualities) must take the lead in the solution." Aphorisms from Shakspeare: Introduction, pp. xii. and xiii.

Again, in speaking of his poems, he remarks—"Transcendent as his original and singular genius was, I think it is not easy, with due attention to _these_ poems, to doubt of his having acquired, when a boy, no ordinary facility in the _classic_ language of Rome;

though his knowledge of it might be small, comparatively, to the knowledge of that great and indefatigable scholar, Ben Jonson. And when Jonson says he had 'less Greek,' had it been true that he had none, it would have been as easy for the verse as for the sentiment to have said 'no Greek.'"—Introduction, p. xxiv.

CHAPTER III.

SHAKSPEARE, AFTER LEAVING SCHOOL, FOLLOWS HIS FATHER'S TRADE—STATEMENT OF AUBREY—PROBABLY PRESENT IN HIS TWELFTH YEAR, AT KENELWORTH, WHEN ELIZABETH VISITED THE EARL OF LEICESTER—TRADITION OF AUBREY CONCERNING HIM—WHETHER THERE IS REASON TO SUPPOSE THAT, AFTER LEAVING HIS FATHER, HE WAS PLACED IN AN ATTORNEY'S OFFICE WHO WAS LIKEWISE SENESCHAL OR STEWARD OF SOME MANOR—ANECDOTES OF SHAKSPEARE—ALLUSIONS IN HIS WORKS TO BARTON, WILNECOTTE AND BARSTON, VILLAGES IN WARWICKSHIRE—EARTHQUAKE IN 1580 ALLUDED TO—WHETHER, AFTER LEAVING SCHOOL, HE ACQUIRED ANY KNOWLEDGE OF THE FRENCH AND ITALIAN LANGUAGES.

That Shakspeare, when taken from the free-school of Stratford, became an assistant to his father in the wool-trade, has been the general opinion of his biographers from the period of Mr. Rowe, who first published the tradition in 1709, to the present day. The anecdote was probably collected by Mr. Betterton the player, who visited Stratford in order to procure intelligence relative to his favourite poet, and from whom Mr. Rowe professes to have derived the greater part of his information.[34:A] A few incidental circumstances tend also to strengthen the account that both father and son were engaged in this employment, and, for a time, together: in the first place, we may mention the discovery already noticed of the arms of the merchants of the wool-staple on a window of the house in which the poet was born[34:B]; secondly, the almost certain conclusion that the poverty of John Shakspeare, which we know to have been considerable in 1579, would naturally incline him to require the assistance of his son, in the only way in which, at that time, he could be serviceable to him; and thirdly, we may adduce the following passages from the works of our Dramatist, which seem to imply a more than theoretic intimacy with his father's business. In the Winter's Tale, the Clown exclaims,

"Let me see:—Every 'leven wether—tods; every tod yields—pound and odd shilling: fifteen hundred shorn,—What comes the wool to?" _Act IV. Scene 2._

Upon this passage Dr. Farmer remarks, "that to _tod_ is used as a verb by dealers in wool; thus, they say, 'Twenty sheep ought to _tod_ fifty pounds of wool,' &c. The meaning, therefore, of the Clown's words is, 'Every eleven wether _tods_; i. e. _will produce a tod_, or twenty-eight pounds of wool; every _tod_ yields a pound and some odd shillings; what then will the wool of fifteen hundred yield?'"

"The occupation of his father," subjoins Mr. Malone, "furnished our poet with accurate knowledge on this subject; for two pounds and a half of wool is, I am told, a very good produce from a sheep at the time of shearing."

"_Every 'leven wether—tods_," adds Mr. Ritson, "has been rightly expounded to mean that the wool of _eleven sheep_ would weigh a _tod_, or 28lb. Each fleece would, therefore, be 2lb. 8oz. 11½dr., and the whole produce of _fifteen hundred shorn 136 tod_, 1 clove, 2lb. 6oz. 2dr. which _at pound and odd shilling per tod_, would yield 143_l._ 3_s._ 0_d._ Our author was too familiar with the subject to be suspected of inaccuracy.

"Indeed it appears from Stafford's _Breefe Conceipte of English Pollicye_, 1581, p. 16, that the price of a tod of wool was at that period _twenty_ or _two_ and _twenty shillings_: so that the medium price was exactly '_pound and odd shilling_.'"[35:A]

In Hamlet, the prince justly observes,

There's a divinity that _shapes our ends_, _Rough-hew_ them how we will. _Act V. Scene 2._

Lines, of which the words in italics were considered by Dr. Farmer as merely technical. "A woolman, butcher, and dealer in _skewers_," says Mr. Stevens, "lately observed to him (Dr. F.), that his nephew, an idle lad, could only _assist_ him in making them; '—he could _rough-hew_ them, but I was obliged to _shape their ends_.' To shape the ends of _wool-skewers_, i. e. to _point_ them, requires a degree of skill; any one can _rough-hew_ them. Whoever recollects the profession of Shakspeare's father, will admit that his son might be no stranger to such terms. I have frequently seen packages of wool pinned up with _skewers_."[36:A]

We may, therefore, after duly considering all the evidence that can now be obtained, pretty confidently acquiesce in the traditional account that Shakspeare was, for a time, and that immediately on his being taken from the free-school, the assistant of his father in the wool-trade; but it will be necessary here to mention, that Aubrey, on whose authority it has been related that John Shakspeare was, at one period of his life, a butcher, adds, with regard to our poet, that "when he was a boy, he exercised his father's trade;" and that "when he killed a calfe, he would do it in a _high style_, and make a speech."[36:B] That John Shakspeare, when under the pressure of adversity, might combine the two employments, which are, in a certain degree, connected with each other, we have already recorded as probable; it is very possible, also, that the following similes may have been suggested to the son, by what he had occasionally observed at home:

And as the butcher takes away the calf, And binds the wretch, and beats it when it strays, Bearing it to the bloody slaughter-house; Even so, remorseless, have they borne him hence. And as the dam runs lowing up and down, Looking the way her harmless young one went, And can do nought but wail her darling's loss; Even so, &c. &c. _Henry VI. Part II. Act III. Scene 1._

but that the father of our poet, the former bailiff of Stratford, should employ his children, instead of servants, in the slaughter of his cattle, is a position so revolting, so unnecessarily degrading on the part of the father, and, at the same time, must have been so discordant with the well-known humane and gentle cast of the poet's disposition, that we cannot, for a moment, allow ourselves to conceive that any credibility can be attached to such a report.

At what age he began to assist his father in the wool-trade, cannot now be positively ascertained; but as he was early taken from school, for this purpose, we shall probably not err far, if we suppose this change to have taken place when he was _twelve_ years old; a computation which includes a period of scholastic education sufficiently long to have imbued him with just such a portion of classical lore, as an impartial enquirer into his life and works would be willing to admit.

A short time previous to this, when our poet was in his twelfth year, and in the summer of 1575, an event occurred which must have made a great impression on his mind; the visit of Queen Elizabeth to the magnificent Earl of Leicester, at Kenelworth Castle. That young Shakspeare was a spectator of the festivities on this occasion, was first suggested by Bishop Percy[37:A], who, in his Essay on the Origin of the English Stage, speaking of the old Coventry play of Hock Tuesday, which was performed before Her Majesty during her residence at the castle, observes,—"Whatever this old play, or 'storial show,' was at the time it was exhibited to Queen Elizabeth, it had probably our young Shakspeare for a spectator, who was then in his twelfth year, and doubtless attended with all the inhabitants of the surrounding country at these 'Princely Pleasures of Kenelworth,'[37:B] _whence Stratford is only a few miles distant_. And as the Queen was much diverted with the Coventry play, 'whereat Her Majestie laught well,' and rewarded the performers with two bucks, and five marks in money: who, 'what rejoicing upon their ample reward, and what triumphing upon the good acceptance, vaunted their play was never so dignified, nor ever any players before so beatified:' but especially if our young Bard afterwards gained admittance into the castle to see a play, which the same evening, after supper, was there 'presented of a very good theme, but so set forth by the actors' well-handling, that pleasure and mirth made it seem very short,' though it lasted two good hours and more, we may imagine what an impression was made on his infant mind. Indeed the dramatic cast of many parts of that superb entertainment, which continued nineteen days, and was the most splendid of the kind ever attempted in this kingdom, must have had a very great effect on a young imagination, whose dramatic powers were hereafter to astonish the world."[38:A]

Of the gorgeous splendour, and elaborate pageantry which were displayed during this princely fete at Kenelworth, some idea may be formed from the following summary. The Earl met the Queen on Saturday the 9th of July 1575, at Long Ichington, a town seven miles from Kenelworth, where His Lordship had erected a tent, for the purpose of banqueting Her Majesty, upon such a magnificent scale, "that justly for dignity," says Laneham, "may be comparable with a beautiful palace; and for greatness and quantity, with a proper town, or rather a citadel;" and to give his readers an adequate conception of its vast magnitude, he adds that "it had seven cart load of pins pertaining to it."[38:B] At the first entrance of the Queen into His Lordship's castle a floating island was discerned upon the pool, glittering with torches, on which sat the Lady of the Lake, attended by two nymphs, who addressed Her Majesty in verse, with an historical account of the antiquity and owners of the castle; and the speech was closed with the sound of cornets, and other instruments of loud music. Within the base-court was erected a stately bridge, twenty feet wide, and seventy feet long, over which the Queen was to pass; and on each side stood columns, with presents upon them to Her Majesty from the gods. Silvanus offered a cage of wild-fowl, and Pomona various sorts of fruits; Ceres gave corn, and Bacchus wine; Neptune presented sea-fish; Mars the habiliments of war; and Phœbus all kinds of musical instruments. During the rest of her stay, varieties of sports and shows were daily exhibited. In the chase was a savage-man clad in ivy accompanied by satyrs; there were bear-baitings and fire-works, Italian tumblers, and a country brideale, running at the Quintain, and Morrice-dancing. And, that no sort of diversion might be omitted, hither came the Coventry-men and acted the old play already mentioned, called Hock Tuesday, a kind of tilting

match, representing, in dumb show, the defeat of the Danes by the English, in the reign of King Ethelred. There were besides on the pool, a Triton riding on a Mermaid eighteen feet long, and Arion upon a Dolphin. To grace the entertainment, the Queen here knighted Sir Thomas Cecil, eldest son to the lord treasurer; Sir Henry Cobham, brother to the Lord Cobham; Sir Francis Stanhope, and Sir Thomas Tresham. An estimate may be formed of the expense from the quantity of ordinary beer, that was drank upon this occasion, which amounted to three hundred and twenty hogsheads.[39:A]

To the ardent and opening mind of our youthful Bard what exquisite delight must this grand festival have imparted, the splendour of which, as Bishop Hurd remarks, "claims a remembrance even in the annals of our country."[39:B] A considerable portion of the very mythology which he had just been studying at school, was here brought before his eyes, of which the costume and language were under the direction of the first poets of the age; and the dramatic cast of the whole pageantry, whether classical or Gothic, was such, as probably to impress his glowing imagination with that bias for theatrical amusements, which afterwards proved the basis of his own glory, and of his country's poetic fame.

Here, could he revisit the glimpses of the day, how justly might he deplore, in his own inimitable language, the havoc of time, and the mutability of human grandeur; of this princely castle, once the seat of feudal hospitality, of revelry and song, and of which Laneham, in his quaint style and orthography, has observed,—"Who that considerz untoo the stately seat of _Kenelworth Castl_, the rare beauty of bilding that His Honor hath avaunced; all of the hard quarry-stone: every room so spacious, so well belighted, and so hy roofed within; so seemly too sight by du proportion without; a day tyme, on every side so glittering by glasse; a night, by continuall brightnesse of candel, fyre, and torch-light, transparent thro the lyghtsome wyndow, as it wear the _Egiptian Pharos_ relucent untoo all the _Alexandrian_ coast: or els (too talke merily with my mery freend) thus radiant, as thoogh _Phœbus_ for hiz eaz woold rest him in the _Castl_, and not every night so to travel doown untoo the _Antipodes_; heertoo so fully furnisht of rich apparell and utensilez apted in all points to the best;"[40:A] of this vast pile the very ruins are now so reduced, that the grand gateway, and the banquetting hall, eighty-six feet in length, and forty-five in width, are the only important remains.[40:B]

If Shakspeare were taken as early from school as we have supposed, and his slender attainments in latinity strongly warrant the supposition, it is more than probable, building on the traditional hint in Rowe, of his aid being _wanted at home_[42:A], that he continued to assist his father in the wool-trade for some years; that is, in all likelihood, until his sixteenth or eighteenth year. Mr. Malone, however, not adverting to this tradition, has, in a note to Rowe's Life, declared his belief, "that, _on leaving school_, Shakspeare was placed in the office of some country attorney, or the seneschal of some manor court[43:A]:" a position which we think improbable only in _point of time_; and, in justice to Mr. Malone, it must be added, that in other places he has given a much wider latitude to the period of this engagement.

The circumstances on which this conjecture has been founded, are these:—that, in the first place, throughout the dramas of Shakspeare, there is interspersed such a vast variety of legal phrases and allusions, expressed with such _technical_ accuracy, as to force upon the mind a conviction, that the person who had used them must have been intimately acquainted with the profession of the law; and, secondly, that at the close of Aubrey's manuscript anecdotes of Shakspeare, which are said to have been collected, at an early period, from the information of the neighbours of the poet, it is positively asserted, that our bard "understood Latin pretty well, for he had been in his younger years a schoolmaster in the country."[43:B]

On the first of these data, it has been observed by Mr. Malone, in his "Attempt to ascertain the Order in which the Plays of Shakspeare were written," that the poet's "knowledge of legal terms is not merely such as might be acquired by the casual observation of even his all-comprehending mind; it has the appearance of _technical_ skill; and he is so fond of displaying it on all occasions, that I suspect he was early initiated in at least the forms of law, and was employed, _while he yet remained at Stratford_, in the office of some country-attorney, who was at the same time a petty conveyancer, and perhaps also the seneschal of some manor-court."[43:C] In confirmation of this opinion, various instances are given of his legal phraseology, which we have copied in the note below[43:D]; and here we must remark that the expression, _while he yet remained at Stratford_, leaves the period of his first application to the law, from the time at which he left school to the era of his visiting London, unfixed; a portion of time which we may fairly estimate as including the lapse of _ten_ years.

With regard to the affirmation of Aubrey, that Shakspeare had been in his younger years a schoolmaster in the country, the same ingenious critic very justly remarks, that "many traditional anecdotes, though not perfectly accurate, contain an adumbration of the truth;" and then adds, "I am strongly inclined to think that the assertion contains, though not the truth, yet something like it: I mean that Shakspeare had been employed for some time in his younger years as a _teacher_ in the country; though Dr. Farmer has incontestably proved, that he could not have been a teacher of _Latin_. I have already suggested my opinion, that before his

coming to London he had acquired some share of legal knowledge in the office of a petty country-conveyancer, or in that of the steward of some manorial court. _If he began to apply to this study at the age of eighteen_, two years afterwards he might have been sufficiently conversant with conveyances to have _taught others_ the form of such legal assurances as are usually prepared by country-attorneys; and perhaps spent two or three years in this employment before he removed from Stratford to London. Some uncertain rumour of this kind might have continued to the middle of the last century, and by the time it reached Mr. Aubrey, our poet's original occupation was changed from a scrivener to that of a schoolmaster."[46:A]

In this quotation it will be immediately perceived that the period of our author's application to the study of the law, is now supposed to have occurred _at the age of eighteen_, when he must have been long removed from school, and that he is also conceived to have been a _teacher_ of what he had acquired in the profession.

These conjectures of Mr. Malone, which, in their latter and modified state, appear to me singularly happy, have met with a warm advocate in Mr. Whiter: "The anecdotes," he remarks, "which have been delivered down to us respecting our poet, appear to me neither improbable nor, when duly examined, inconsistent with each other: even those which seem least allied to probability, contain in my opinion the _adumbrata_, if not _expressa signa veritatis_. Mr. Malone has admirably sifted the accounts of _Aubrey_; and there is no truth, that is obtained by a train of reasoning not reducible to demonstration, of which I am more convinced than the conjecture of Mr. Malone, who supposes that Shakspeare, before he quitted Stratford, was employed in such matters of business as belonged to the office of a country-attorney, or the steward of a manor-court. I have stated his conjecture in general terms, that the _fact_, as it relates to our poet's _legal allusions_, might be separated from any accidental circumstances of _historical truth_. I am astonished, however, that Mr. Malone has confirmed his conjecture by so few examples. I can supply him with a very large accession."[46:B]

Mr. Chalmers, however, refuses his aid in the structure of this conjectural fabric, and asserts that Shakspeare might have derived all his technical knowledge of the law from a very few books. "From Totell's Presidents, 1572; from Pulton's Statutes, 1578; and from the Lawier's Logike, 1588."[47:A]

That these books were read by Shakspeare, there can, we think, be little doubt; but this concession by no means militates against the idea of his having been employed for a short period in some profitable branch of the law. After weighing all the evidence which can _now_ be adduced, either for or against the hypothesis, we shall probably make the nearest approximation to the truth in concluding, that the object of our research, having assisted his father for some years in the wool-trade, for which express purpose he had been early taken from school, might deem it necessary, on the prospect of approaching marriage, to acquire some additional means of supporting a domestic establishment, and, accordingly, annexed to his former occupation, or superseded it, by a knowledge of an useful branch of the law, which, by being taught to others, might prove to himself a source of revenue. Thus combining the record of Rowe with the tradition of Aubrey, and with the evidence derived from our author's own works, an inference has been drawn which, though not amounting to certainty, approaches the confine of it with no small pretensions.

Of the events and circumstances which must have occurred to Shakspeare in the interval between his leaving the free-school of Stratford, and his marriage, scarcely any thing has transpired; the following anecdote, however, which is still preserved at Stratford and the neighbouring village of Bidford, may be ascribed with greater propriety to this than to any subsequent period of his life. We shall give it in the words of the author of the "Picturesque Views on the Avon," who professes to have received it on the spot, as one of the traditional treasures of the place. Speaking of Bidford, which is still equally notorious for the excellence of its ale, and the thirsty clay of its inhabitants, he adds, "there were antiently two societies of village-yeomanry in this place, who frequently met under the appellation of Bidford Topers. It was a custom with these heroes to challenge any of their neighbours, famed for the love of good ale, to a drunken combat: among others the people of Stratford were called out to a trial of strength, and in the number of their champions, as the traditional story runs, our Shakspeare, who forswore all thin potations, and addicted himself to ale as lustily as Falstaff to his sack, is said to have entered the lists. In confirmation of this tradition we find an epigram written by Sir Asten Cockayn, and published in his poems in 1658, p. 124: it runs thus—

TO MR. CLEMENT FISHER, OF WINCOT.

SHAKSPEARE, your _Wincot_ ale hath much renown'd, That fox'd a beggar so (by chance was found Sleeping) that there needed not many a word To make him to believe he was a lord: But you affirm (and in it seems most eager) 'Twill make a lord as drunk as any beggar. Bid _Norton_ brew such ale as Shakspeare fancies Did put Kit Sly into such lordly trances: And let us meet there (for a fit of gladness) And drink ourselves merry in sober sadness.

"When the Stratford lads went over to Bidford, they found the topers were gone to Evesham fair; but were told, if they wished to try their strength with the sippers, they were ready for the contest. This being acceded to, our bard and his companions were staggered at the first outset, when they thought it adviseable to sound a retreat, while the means of retreat were practicable; and then had scarce marched half a mile, before they were all forced to lay down more than their arms, and encamp in a very disorderly and unmilitary form, under no better covering than a large crab-tree; and there they rested till morning:

"This tree is yet standing by the side of the road. If, as it has been observed by the late Mr. T. Warton, the meanest hovel to which Shakspeare has an allusion interests curiosity, and acquires an importance, surely the tree that has spread its shade over him, and sheltered him from the dews of the night, has a claim to our attention.

"In the morning, when the company awakened our bard, the story says they intreated him to return to Bidford, and renew the charge; but this he declined, and looking round upon the adjoining villages, exclaimed, 'No! I have had enough; I have drank with

Piping Pebworth, Dancing Marston, Haunted Hillbro', Hungry Grafton, Dudging Exhall, Papist Wicksford, Beggarly Broom, and Drunken Bidford.'

"Of the truth of this story I have very little doubt: it is certain that the crab-tree is known all round the country by the name of Shakspeare's crab; and that the villages to which the allusion is made, all bear the epithets here given them: the people of Pebworth are still famed for their skill on the pipe and tabor: Hillborough is now called Haunted Hillborough; and Grafton is notorious for the poverty of its soil."[50:A]

To the immediate neighbourhood indeed of Stratford, and to the adjacent country, with which, at this early period of his life, our poet seems to have been familiarised by frequent excursions either of pleasure or business, are to be found some allusions in his dramatic works. In the _Taming of the Shrew_, Christopher Sly, being treated with great ceremony and state, on waking in the bed-chamber of the nobleman, exclaims—"What, would you make me mad? Am not I Christopher Sly, old Sly's son of _Burton-Heath_; by birth a pedlar, by education a card-maker, by transmutation a bear-herd, and now by present profession a tinker? Ask Marian Hacket, the fat ale-wife of _Wincot_, if she know me not: if she say I am not fourteen pence on the score for sheer ale, score me up for the lyingest knave in Christendom. What, I am not bestraught!"[50:B]

There are two villages in Warwickshire called _Burton Dorset_ and _Burton Hastings_; but that which was the residence of old Sly, is, in all probability, _Burton on the Heath_, on the south side of the Avon, opposite to Bidford, and about eighteen miles from Stratford. The first scene of the play is described as _Before an Alehouse on a Heath_, and it is remarkable that on Burton-heath there still remains a tenement, which was formerly a public-house, under the name of Woncott or Onecott: yet there is much reason to conclude, from the mode in which Wincot is spoken of, both in this place, and in the following passage, that Burton-heath and Wincot were considerably distant: in the Second Part of King Henry IV. Davy says to Justice Shallow, "I beseech you, Sir, to countenance William Visor _of Wincot_ against Clemont Perkes of the hill[50:C]," a phraseology which seems to imply, not an insulated house, but a village, an inference which is strongly supported by the fact that _near_ Stratford there is actually a village with the closely resembling name of _Wilnecotte_, which, in the pronunciation and orthography of the common people, would almost necessarily become _Wincot_. It should likewise be mentioned that Mr. Warton is of opinion that this is the place to which Shakspeare alludes, and he adds, "the house kept by our genial hostess still remains, but is at present a mill."[51:A]

We are indebted also to the Second Part of King Henry IV. for another local allusion of a similar kind: Silence, addressing Pistol, nicknames him "goodman Puff of _Barson_[51:B]," a village which, under this appellation, and that of _Barston_, is situated between Coventry and Solyhall. It may indeed excite some surprise that we have not more allusions of this nature to commemorate; that the scenery which occurred to him early in life, and especially at this period, when the imagery drawn from nature must have been impressed on his mind in a manner peculiarly vivid and defined, when he was free from care, unshackled by a family, and at liberty to roam where fancy led him, has not been delineated in some portion of his works, with such accuracy as immediately to designate its origin. For, if we consider the excursive powers of his imagination, and the desultory and unsettled habits which tradition has ascribed to him during his youthful residence at Stratford, we may assert, without fear of contradiction, and as an undoubted truth, that his rambles into the country, and for a poet's purpose, were both frequent and extensive, and that not a stream, a wood, or hamlet, within many miles of his native town, was unvisited by him at various times and under various circumstances.

Yet, if we can seldom point out in his works any distinct reference to the actual scenery of Stratford and its neighbourhood, we may observe, that few of the remarkable events of his own time appear to have escaped his notice; and among these may be found one

which occurred at this juvenile period of his life, and to which we have an allusion in Romeo and Juliet; for though the personages of the drama exist and act in a foreign clime, yet in this, and in many similar instances, he hesitates not to describe the events of his native country as occurring wherever he has chosen to lay the scene. Thus the nurse, describing to Lady Capulet the age at which Juliet was weaned, says

'"Tis since the _earthquake_ now eleven years,"—

a line, which, as Mr. Tyrwhitt and Mr. Malone have observed[52:A], manifestly alludes to a phenomenon of this kind that had been felt throughout England in the year 1580, and of which Holinshed, the favourite historian of our bard, has given the following striking account:—"On the sixt of April (1580), being Wednesdaie in Easter weeke, about six of the clocke toward evening, a sudden earthquake happening in London, and almost generallie throughout all England, caused such an amazednesse among the people as was wonderfull for the time, and caused them to make their earnest praiers to Almighty God! The great clocke bell in the palace at Westminster strake of it selfe against the hammer with the shaking of the earth, as diverse other clocks and bels in the steeples of the cities of London and els-where did the like. The gentlemen of the Temple being then at supper, ran from the tables, and out of their hall with their knives in their hands. The people assembled at the plaie-houses in the fields, as at the Whoreater (the Theater I would saie) were so amazed, that doubting the ruine of the galleries, they made hast to be gone. A péece of the Temple church fell downe, some stones fell from Saint Paule's church in London: and at Christ's church neere to Newgate-market, in the sermon while, a stone fell from the top of the same church, which stone killed out of hand one Thomas Greie an apprentice, and another stone fell on his fellow-servant named Mabell Eueret, and so brused hir that she lived but four daies after. Diverse other at that time in that place were sore hurt, with running out of the church one over an other for feare. The tops of diverse chimnies in the citie fell downe, the houses were so shaken: a part of the castell at Bishops Stratford in Essex fell downe. This earthquake indured in or about London not passing one minute of an houre, and was no more felt. But afterward in Kent, and on the sea coast it was felt three times; and at Sandwich at six of the clocke the land not onelie quaked, but the sea also fomed, so that the ships tottered. At Dover also the same houre was the like, so that a péece of the cliffe fell into the sea, with also a péece of the castell wall there: a piece of Saltwood castell in Kent fell downe: and in the church of Hide the bels were heard to sound. A peece of Sutton church in Kent fell downe, the earthquake being there not onlie felt, but also heard. And in all these places and others in east Kent, the same earthquake was felt three times to move, to wit, at six, at nine, and at eleven of the clocke."[53:A] In this passage, to which we shall again have occasion to revert, the violence and universality of the event described, are such as would almost necessarily form an era for reference in the poet's mind; and the date, indeed, of the _prima stamina_ of the play in which the line above-mentioned is found, may be nearly ascertained by this allusion.

If, as some of his commentators have supposed, Shakspeare possessed any grammatical knowledge of the French and Italian languages, it is highly probable that the acquisition must have been obtained in the interval which took place between his quitting the grammar-school of Stratford and his marriage, a period, if our arrangement be admitted, of about six years; and consequently, any consideration of the subject will almost necessarily claim a place at the close of this chapter.

That the dramas of our great poet exhibit numerous instances in which both these languages are introduced, and especially the former, of which we have an entire scene in Henry V., will not be denied by any reader of his works; nor will any person, acquainted with the literature of his times, venture to affirm, that he might not have acquired by his own industry, and through the medium of the introductory books then in circulation, a sufficient knowledge of French and Italian for all the purposes which he had in view. We cannot therefore agree with Dr. Farmer, when he asserts, that Shakspeare's acquaintance with these languages consisted only of _a familiar phrase or two_ picked up _in the writers of the time, or the course of his conversation_.[54:A]

The corrupted state of the French and Italian passages, as found in the early editions of our poet's plays, can be no argument that he was totally ignorant of these languages; as it would apply with nearly equal force to prove that he was similarly situated with regard to his vernacular tongue, which in almost every scene of these very editions has undergone various and gross corruptions. Nor will greater conviction result, when it is affirmed that this foreign phraseology might be the interpolation of the players; for it remains to be ascertained, that they possessed a larger portion of exotic literature than Shakspeare himself.

The author of an essay on Shakspeare's learning in the _Censura Literaria_, from which we have already quoted a passage in favour of his having made some progress in latinity, is likewise of opinion that his knowledge of the French was greater than Dr. Farmer is willing to allow.

"I have been confirmed in this opinion," he observes, "by a casual discovery of Shakspeare having imitated a whole French line and description in a long French epic poem, written by Garnier, called the _Henriade_, like Voltaire's, and on the same subject, first published in 1594.

"In _As You Like It_, Shakspeare gives an affecting description of the different manners of men in the different ages of life, which closes with these lines:

"What ends this strange eventful history Is second childishness and mere oblivion, Sans teeth, sans eyes, sans taste, sans every thing."

"Now—why have recourse for an insipid preposition to a language of which he is said to have been totally ignorant? I always supposed therefore that there must have been some peculiar circumstance well known in those times, which must have induced him to give this motley garb to his language:—but what that circumstance was I could not discover until I accidentally in a foreign literary journal, met with a review of a republication of that poem of Garnier at Paris, in which were inserted, as a specimen of the poem, a description of the appearance of the ghost of Admiral Coligny on the night after his murder at the massacre of St. Bartholomew, and in the following lines:

"_Sans pieds, sans mains, sans nez, sans oreilles, sans yeux, Meurtri de toutes parts; la barbe et les cheveux Poudreux, ensanglantez, chose presque incredible! Tant cette vision etoit triste et horrible!_"

"Here it immediately appeared to what author Shakspeare had gone for the archetype of his own description of the last stage of old age, which, by a parody on the above lines, he meant to represent like to that mutilated ghost; and this seems to indicate that he had read that poem in the original; for we even find the _meurtri de toutes parts_ imitated by _sans every thing_. A friend of mine formerly mentioned this to Mr. Steevens, and he has briefly noticed this parody, if I recollect rightly, in his joint edition along with Johnson[55:A], but he did not copy the original lines of Garnier; nor so far as I know any editor since; which however are too remarkable to be altogether consigned to oblivion; and it is not very likely, that any Englishman will ever read through that long dull poem; neither should I myself have known of those lines, if they had not been quoted as a specimen. Steevens's note is so very brief as to be quite obscure in regard to what consequence he thought deducible from the imitation: he seems to suggest as if there might have been some English translation of the poem published, though now unknown; this is the constant refuge for Shakspeare's knowledge of any thing written originally in another language. But even if the fact were true, yet no translator would have preserved the repetition of that word _sans_; for this he must have gone to the French poem itself, therefore must at least have been able to read that line in French, if not also the whole description of the ghost; and if that, why not able also to read other French books? It may indeed, be _supposed_, that some friend may have shown him the above description, and explained to him the meaning of the French lines, but this is only to make a second supposition in order to support a former one made without sufficient foundation: we may just as well make a single supposition at once, that he was himself able to read and understand it, since he has evidently derived from it his own description of the decrepitude of old age. Upon the whole, if his copy of a single word from Holinshed, viz. 'on _this_ side Tiber,' is a proof of his having read that historian, why also is not his copy of the repetition of _sans_, and his parody of Coligny's ghost, an equally good proof of his having read the poem of Garnier in the original French language? To reason otherwise is to say, that when he gives us bad French, this proves him not to understand it; and that when he gives us good French, applied with propriety and even with ingenuity, yet this again equally proves that he neither understood what he wrote, nor was so much as able to read the French lines, which he has thus so wittily imitated."[56:A]

Dr. Farmer has himself granted that Shakspeare _began_ to learn Latin: why then not allow, from premises still more copious and convincing, that he began likewise to learn French and Italian? That he wanted not inclination for the attempt, the frequent use of these languages in his works will sufficiently evince; that he had some leisure at the period which we have appropriated to these acquisitions, namely, between the years 1576 and 1582, few will be disposed to deny; and that he had books which might enable him to make some progress in these studies, the following list will ascertain:—

1. A Treatyse English and French right necessarye and profitable for all young Children. 1560.

2. Principal Rules of the Italian Grammar, &c. Newly corrected and imprinted by Wykes: 1560, reprinted 1567.

3. The Italian Grammar and Dictionary: By W. Thomas. 1561.

4. Lentulo's Italian Grammar, put into English: By Henry Grenthem. 1578.

5. Ploiche, Peter, Introduction to the French Tongue. 1578.

6. An Alvearie, or Quadruple Dictionarie, containing foure sundrie tongues: namelie, English, Latine, Greeke, and French: By I. Baret. 1580.[57:A]

In short, with regard to the literature of Shakspeare, the nearest approximation to the truth will be found to arise from taking a medium course between the conclusions of Dr. Farmer, and of those who have gone into a contrary extreme. That he had made some and that the usual progress in the Latin language during the short period of his school-education, it is, we think, in vain to deny; but that he ever attained the power of reading a Roman classic with facility, cannot with any probability be affirmed: it will be likewise, we are disposed to believe, equally rational and correct, if we conclude, from the evidence which his genius and his works afford, that his acquaintance with the French and Italian languages was not merely confined to the picking up _a familiar phrase or two_ from the conversation or writings of others, but that he had actually commenced, and at an early period too, the study of these languages, though, from his situation, and the circumstances of his life, he had neither the means nor the opportunity of cultivating them to any considerable extent.[58:A]

FOOTNOTES:

[34:A] "Mr. Betterton," observes Mr. Malone, "was born in 1635, and had many opportunities of collecting information relative to Shakspeare, but unfortunately the age in which he lived was not an age of curiosity. Had either he or Dryden or Sir William d'Avenant taken the trouble to visit our poet's youngest daughter, who lived till 1662, or his grand-daughter, who did not die till 1670, many particulars might have been preserved which are now irrecoverably lost. Shakspeare's sister, Joan Hart, who was only five years younger than him, died at Stratford in Nov. 1646, at the age of seventy-six; and from her undoubtedly his two daughters, and his grand-daughter Lady Bernard, had learned several circumstances of his early history antecedent to the year 1600." Reed's Shakspeare, p. 119, 120.

[34:B] It has already been observed, in a note written some years after the composition of the text, that this supposed corroboration is no longer to be depended upon.

[40:A] Laneham's Account, p. 65. of the Original.

[40:B] The following extract from Laneham's Letter, which immediately follows the passage given in the text, and in which I have dropped the author's singular orthography, will afford the reader a curious and very entertaining description of the costly and magnificent gardens of Kenelworth Castle, gardens in which it is probable the youthful Shakpeare had more than once wandered with delight:—

"Unto this, His Honour's exquisite appointment of a beautiful garden, an acre or more of quantity, that lieth on the north there: wherein hard all along the castle-wall is reared a pleasant terrace of a ten foot high, and a twelve broad: even under foot, and fresh of fine grass; as is also the side thereof toward the garden, in which, by sundry equal distances, with obelisks, spheres, and white

bears, all of stone, upon their curious bases, by goodly shew were set: to these two fine arbours redolent by sweet trees and flowers, at each end one, the garden plot under that, with fair allies green by grass, even voided from the borders a both sides, and some (for change) with sand, not light or too soft or soily by dust, but smooth and firm, pleasant to walk on, as a sea-shore when the water is availd: then, much gracified by due proportion of four even quarters: in the midst of each, upon a base a two foot square, and high, seemly bordered of itself, a square pilaster rising pyramidally of a fifteen foot high: simmetrically pierced through from a foot beneath, until a two foot of the top: whereupon for a capital, an orb of a ten inches thick: every of these (with his base) from the ground to the top, of one whole piece; hewn out of hard porphery, and with great art and heed (thinks me) thither conveyed and there erected. Where, further also, by great cast and cost, the sweetness of savour on all sides, made so repirant from the redolent plants and fragrant herbs and flowers, in form, colour, and quantity so deliriously variant; and fruit-trees bedecked with apples, pears, and ripe cherries.

"And unto these, in the midst against the terrace, a square cage, sumptuous and beautiful, joined hard to the north wall (that a that side gards the garden as the garden the castle), of a rare form and excellency, was raised: in height a twenty foot, thirty long, and a fourteen broad. From the ground strong and close, reared breast high, whereat a soil of a fair moulding was couched all about: from that upward, four great windows a front, and two at each end, every one a five foot wide, as many more even above them, divided on all parts by a transome and architrave, so likewise ranging about the cage. Each window arched in the top, and parted from other in even distance by flat fair bolted columns, all in form and beauty like, that supported a comely cornish couched all along upon the bole square; which with a wire net, finely knit, of mashes six square, an inch wide (as it were for a flat roof) and likewise the space of every window with great cunning and comeliness, even and tight was all over-strained. Under the cornish again, every part beautified with great diamonds, emeralds, rubies, and sapphires; pointed, tabled, rok and round; garnished with their gold, by skilful head and hand, and by toil and pencil so lively expressed, as it mought be great marvel and pleasure to consider how near excellency of art could approach unto perfection of nature.

"Holes were there also and caverns in orderly distance and fashion, voided into the wall, as well for heat, for coolness, for roost a nights and refuge in weather, as also for breeding when time is. More, fair even and fresh holly-trees for pearching and proining, set within, toward each end one.

"Hereto, their diversity of meats, their fine several vessels for their water and sundry grains; and a man skilful and diligent to look to them and tend them.

"But (shall I tell you) the silver sounded lute, without the sweet touch of hand; the glorious golden cup, without the fresh fragrant wine; or the rich ring with gem, without the fair featured finger; is nothing indeed in his proper grace and use: even so His Honour accounted of this mansion, till he had placed their tenants according. Had it therefore replenished with lively birds, _English_, _French_, _Spanish_, _Canarian_, and (I am deceived if I saw not some) _African_. Whereby, whether it became more delightsome in change of tunes, and harmony to the ear; or else in difference of colours, kinds, and properties to the eye, I'll tell you if I can, when I have better bethought me.

"In the centre (as it were) of this goodly garden, was there placed a very fair fountain, cast into an eight-square, reared a four foot high; from the midst whereof a column up set in shape of two Athlants joined together a back half; the one looking east, tother west, with their hands upholding a fair formed bowl of a three foot over; from whence sundry fine pipes did lively distill continual streams into the receipt of the fountain, maintained still two foot deep by the same fresh falling water: wherein pleasantly playing to and fro, and round about, carp, tench, bream, and for variety, perch, and eel, fish fair-liking all, and large: In the top, the _ragged staff_; which with the bowl, the pillar, and eight sides beneath, were all hewn out of rich and hard white marble. A one side _Neptune_ with his tridental fuskin triumphing in his throne, trailed into the deep by his marine horses. On another, _Thetis_ in her chariot drawn by her dolphins. Then _Triton_ by his fishes. Here _Proteus_ herding his sea-bulls. There _Doris_ and her daughters solacing a sea and sands. The waves scourging with froth and foam, intermingled in place, with whales, whirlpools, sturgeons, tunnies, conchs, and wealks, all engraven by exquisite device and skill, so as I may think this not much inferior unto _Phœbus_ gates, which (Ovid says) and peradventure a pattern to this, that _Vulcan_ himself did cut: whereof such was the excellency of art, that the work in value surmounted the stuff, and yet were the gates all of clean massy silver.

"Here were things, ye see, mought inflame any mind to long after looking: but whoso was found so hot in desire, with the wreast of a cok was sure of a cooler: water spurting upward with such vehemency, as they should by and by be moistened from top to toe; the he's to some laughing, but the she's to more sport. This some time was occupied to very good pastime.

"A garden then so appointed, as wherein aloft upon sweet shawdowed walk of terrace, in heat of summer, to feel the pleasant whisking wind above, or delectable coolness of the fountain spring beneath: to taste of delicious strawberries, cherries and other fruits, even from their stalks: to smell such fragrancy of sweet odours, breathing from the plants, herbs, and flowers: to hear such natural melodious musick and tunes of birds: to have in eye, for mirth, some time these under springing streams; then, the woods, the waters (for both pool and chase were hard at hand in sight,) the deer, the people (that out of the east arbour in the base court also at hand in view,) the fruits trees, the plants, the herbs, the flowers, the change in colours, the birds flittering, the fountain streaming, the fish swimming, all in such delectable variety, order, dignity; whereby, at one moment, in one place, at hand, without travel, to have so full fruition of so many God's blessings, by entire delight unto all senses (if all can take) at once: for _etymon_ of the word worthy to be called _Paradise_: and though not so goodly as _Paradise_ for want of the fair rivers, yet better a great deal by the lack of so unhappy a tree." Pages 66-72.

[43:D]

'"——— For what in me was _purchased_, Falls upon thee in a much fairer sort.' _K. Hen. IV. P. II._

"_Purchase_ is here used in its strict legal sense, in contradistinction to an acquisition by _descent_.

'Unless the devil have him in _fee-simple, with fine and recovery_.' _Merry Wives of Windsor._

'He is 'rested _on the case_.' _Comedy of Errors._

'——— with _bills_ on their necks, Be it known unto all men by these presents,' &c. _As you like it._

'——— who writes himself armigero, in any _bill, warrant, quittance, or obligation_.' _Merry Wives of Windsor._

'Go with me to a notary, seal me there Your _single bond_.' _Merchant of Venice._

'Say, for non-payment that the debt should double.' _Venus and Adonis._

"On a conditional bond's becoming forfeited for non-payment of money borrowed, the whole penalty, which is usually the double of the principal sum lent by the obligee, was formerly recoverable at law. To this our poet here alludes.

'But the defendant doth that plea deny; To 'cide his title, is impanell'd A quest of thoughts.' _Sonnet 46._

"In _Much Ado about Nothing_, Dogberry charges the watch to keep their _fellow's counsel and their own_. This Shakspeare transferred from the oath of a grand juryman.

'And let my officers of such a nature Make an _extent_ upon his house and lands.' _As you like it._

'He was taken _with the manner_.' _Love's Labour's lost._

'_Enfeof'd_ himself to popularity.' _K. Hen. IV. P. I._

'He will seal the fee-simple of his salvation, and cut the entail from all remainders, and a perpetual succession for it perpetually.' _All's Well that ends Well._

'Why, let her _accept before excepted_.' _Twelfth Night._

'——— which is four terms or two actions;—and he shall laugh without _intervallums_.' _K. Hen. IV. P. II._

'——— keeps leets and _law-days_.' _K. Richard II._

'_Pray in aid_ for kindness.' _Anthony and Cleopatra._

"No writer but one who had been conversant with the technical language of leases and other conveyances, would have used _determination_ as synonymous to _end_. Shakspeare frequently uses the word in that sense. See vol. xii. (Reed's Shakspeare,) p. 202. n. 2.; vol. xiii. p. 127. n. 4.; and (Mr. Malone's edit.) vol. x. p. 202. n. 8. 'From and after the _determination_ of such a term,' is the regular language of conveyancers.

'Humbly complaining to Your Highness.' _K. Richard III._

'Humbly complaining to Your Lordship, your orator,' &c. are the first words of every bill in chancery.

'A kiss in fee farm! In witness whereof these parties interchangeably have set their hands and seals.' _Troilus and Cressida._

'Art thou a _feodary_ for this act?' _Cymbeline._

"See the note on that passage, vol. xviii. p. 507, 508. n. 3. Reed's edit.

'Are those _precepts_ served?' says Shallow to Davy, in _K. Henry IV._

"_Precept_ in this sense is a word only known in the office of a justice of peace.

'Tell me what state, what dignity, what honour, Can'st thou _demise_ to any child of mine?' _K. Richard III._

'——— hath _demised_, granted, and to farm let,' is the constant language of leases. What _poet_ but Shakspeare has used the word _demised_ in this sense?

"Perhaps it may be said, that our author in the same manner may be proved to have been equally conversant with the terms of divinity or physic. Whenever as large a number of instances of his ecclesiastical or medicinal knowledge shall be produced, what has now been stated will certainly not be entitled to any weight." Malone, Reed's Shakspeare, vol. ii. p. 276. n. 9.

[46:A] Reed's Shakspeare, vol. iii. p. 222, 223.

[46:B] Whiter's Specimen of a Commentary, p. 95. note. As Mr. Whiter has not chosen to append these additional examples, I have thought it would be satisfactory to give the few which more immediately occur to my memory.

"Immediately provided in that case." _Midsummer Night's Dream._

"Royally attornied." _Winter's Tale._

"That doth _utter_ all men's ware-a." _Winter's Tale._

"Thy title is _affeer'd_." (This is a law-term for confirmed.)

"Keep leets, and law-days, and in sessions sit." _Othello._

"Why should calamity be full of words? Windy _attorneys_ to their _client_ woes." _Richard III._

"But when the heart's _attorney_ once is mute, The _client_ breaks, as desperate in his suit." _Venus and Adonis._

"So now I have confessed that he is thine, And I myself am _mortgaged to thy Will_." _Sonnet 134._

"He learn'd but, _surety-like_, to write for me, _Under that bond that him as fast doth bind_. The _statute_ of thy beauty, &c." _Sonnet 134._

[47:A] Chalmers's Apology, p. 554. The "Lawiers Logike" was written by Abraham Fraunce.

[50:A] Ireland's Picturesque Views, p. 229-233.

[50:B] Act i. sc. 2.

[50:C] Act v. sc. 1.

[51:A] Mr. Edwards and Mr. Steevens have conjectured that _Barton_ and _Woodmancot_, vulgarly pronounced _Woncot_, in Gloucestershire, might be the places meant by Shakspeare; and Mr. Tollet remarks, that _Woncot_, may be put for _Wolphmancote_, vulgarly _Ovencote_, in Warwickshire. Vide Reed's Shakspeare, vol. ix. p. 30., and vol. xii. p. 240.

[51:B] Act v. sc. 3.

[52:A] Reed's Shakspeare, vol. xx. p. 38. n. 2.

[53:A] Holinshed's Chronicles, vol. iv. p. 126. edit. of 1808.

[54:A] Reed's Shakspeare, vol. ii. p. 85. Mr. Capel Lofft's opinion of the Italian literature of Shakspeare is somewhat more extended than my own. "My impression," says he, "is, that Shakspeare was not unacquainted with the most popular authors in _Italian prose_: and that his ear had listened to the enchanting tones of _Petrarca_ and some others of their great poets." Preface to his Laura, p. cxcii.

[55:A] This notice does not appear in the Variorum edition of 1803.

[56:A] Censura Literaria, vol. ix. p. 287. et seq.

[57:A] Vide Chalmers's Apology, p. 549. and Bibliotheca Reediana, p. 9.

[58:A] Since these observations were written, a work has fallen into my hands under the title of "A Tour in Quest of Genealogy, through several parts of Wales, Somersetshire, and Wiltshire, in a Series of Letters to a Friend in Dublin; interspersed with a description of Stourhead and Stonehenge; together with various Anecdotes and curious Fragments from a Manuscript Collection ascribed to Shakespeare. By a Barrister." London, 1811.

These manuscripts ascribed to Shakspeare, which, from the language and sentiment of almost every line, are manifestly a mere fiction, are said to have been purchased at an auction at Carmarthen, consisting of verses and letters that passed between Shakspeare and his mistress Anne Hatheway, together with letters to and from him and others, a journal of Shakspeare, an account of many of his plays, memoirs of his life by himself, &c. I have mentioned the publication in this place, as it is worthy of remark, that the fabricator of these MSS., whoever he is, appears to have entertained an idea similar to my own, with regard to the period when our poet attempted the acquisition of the modern languages; for of the supposed memoirs said to be written by Shakspeare himself, the following, among others, is given as a specimen:—

"Having an ernest desier to lerne forraine tonges, it was mie good happ to have in mie fathere's howse an Italian, one Girolama Albergi, tho he went bye the name of Francesco Manzini, a dier of woole; but he was not what he wished to passe for; he had the breedinge of a gentilman, and was a righte sounde scholer. It was he taught me the littel Italian I know, and rubbed up my Latten; we redd Bandello's Novells together, from the which I gatherid some delliceous flowres to stick in mie dramattick poseys. He was nevew to Battisto Tibaldi, who made a translacion of the Greek poete, Homar, into Italian; he showed me a coppy of it given him by hys kinsman, Ercole Tibaldi." P. 202.

I must do the author of this literary forgery, however, the justice to say, that in taste and genius he is immeasurably beyond his youthful predecessor, and that some of the verses ascribed to _Anna_ Hatheway, as he terms her, possess no inconsiderable beauties. It is most extraordinary, however, that any individual should venture to bring forward the following lines, which are exquisitely modern in their structure, as the production of a cottage girl of the sixteenth century.

TO THE BELOVYD OF THE MUSES AND MEE.

SWEETE swanne of Avon, thou whoose art Can mould at will the human hart, Can drawe from all who reade or heare, The unresisted smile and teare:

By thee a vyllege maiden found, No care had I for measured sounde; To dresse the fleese that Willie wrought Was all I knewe, was all I sought.

At thie softe lure too quicke I flewe, Enamored of thie songe I grew; The distaffe soone was layd aside, And all mie woork thie straynes supply'd.

Thou gavest at first th' inchanting quill, And everie kiss convay'd thie skill; Unfelt, ye maides, ye cannot tell The wondrous force of suche a spell.

Nor marvell if thie breath transfuse A charme repleate with everie muse; They cluster rounde thie lippes, and thyne Distill theire sweetes improv'd on myne. ANNA HATHEWAY.

CHAPTER IV.

SHAKSPEARE MARRIED TO ANNE HATHAWAY—ACCOUNT OF THE HATHAWAYS—COTTAGE AT SHOTTERY—BIRTH OF HIS ELDEST CHILD, SUSANNA—HAMNET AND JUDITH BAPTIZED—ANECDOTE OF SHAKSPEARE—APPARENTLY SETTLED IN THE COUNTRY.

Shakspeare married and became the father of a family at a very early period; at a period, indeed, when most young men, even in his own days, had only completed their school-education. He had probably been attached also to the object of his affections, who resided very near to him, for a year or two previous to the nuptial connection, which took place in 1582; and Mr. Malone is inclined to believe that the ceremony was performed either at Hampton-Lacy, or at Billesley, in the August of that year[59:A], when consequently the poet had not attained the age of eighteen and a half!

The maiden name of the lady who had induced her lover to enter thus early on the world, with little more than his passion to console, and his genius to support them, was _Anne Hathaway_, the daughter of Richard Hathaway, a substantial yeoman, residing at Shottery, a village about a mile distant from Stratford. It appears also from the tomb-stone of his mistress[60:A] in the church of Stratford, that she must have been born in 1556, and was therefore eight years older than himself.

Of the family of the Hathaways little now, except the record of a few deaths and baptisms, can be ascertained with precision: in the register-books of the parish of Stratford, the following entry, in all probability, refers to the father of the poet's wife:—

"Johanna, daughter of _Richard Hathaway_, otherwise Gardiner, of Shottery, was baptized May 9, 1566."[60:B]

As the register does not commence before 1558, the baptism of _Anne_ could not of course be included; but it appears that the family of this Richard was pretty numerous, for Thomas his son was baptized at Stratford, April 12. 1569; John, another son, Feb. 3. 1574; and William, another son, Nov. 30. 1578.[60:C] Thomas died at Stratford in 1654-5, at the advanced age of eighty-five.[60:D] That the Hathaways have continued resident at Shottery and the neighbourhood, down to the present age, will be evident from the note below, which records their deaths to the year 1785, as inscribed on the floor, in the nave and aisle of Stratford church.[60:E]

The cottage at Shottery, in which Anne and her parents dwelt, is said to be yet standing, and is still pointed out to strangers as a subject of curiosity. It is now impossible to substantiate the truth of the tradition; but Mr. Ireland, who has given a sketch of this cottage in his Picturesque Views on the Avon, observes, "it is still occupied by the descendants of her family, who are poor and numerous. To this same humble cottage I was referred when pursuing the same inquiry, by the late Mr. Harte, of Stratford, before-mentioned. He told me there was an old oak chair, that had always in his remembrance been called Shakspeare's courting chair, with a purse that had been likewise his, and handed down from him to his grand-daughter Lady Bernard, and from her through the Hathaway family to those of the present day. From the best information I was able to collect at the time, I was induced to consider this account as authentic, and from a wish to obtain the smallest trifle appertaining to our Shakspeare, I became a purchaser of these relics. Of the chair I have here given a sketch: it is of a date sufficiently ancient to justify the credibility of its history; and as to farther proof, it must rest on the traditional opinion and the character of this poor family. The purse is about four inches square, and is curiously wrought with small black and white bugles and beads; the tassels are of the same materials. The bed and other furniture in the room where the chair stood, have the appearance of so high antiquity, as to leave no doubt but that they might all have been the furniture of this house long before the time of Shakspeare.

"The proprietor of this furniture, an old woman upwards of seventy, had slept in the bed from her childhood, and was always told it had been there since the house was built. Her absolute refusal to part with this bed at any price was one of the circumstances which led to a persuasion that I had not listened with too easy credulity to the tale she told me respecting the articles I had purchased. By the same person I was informed, that at the time of the Jubilee, the late George Garrick obtained from her a small inkstand, and a pair of fringed gloves, said to have been worn by Shakspeare."[61:A]

Of the personal charms of the poet's mistress nothing has been transmitted to us by which we can form the smallest estimate, nor can we positively ascertain whether convenience, or the attraction of a beautiful form, was the chief promoter of this early connection. Mr. Rowe merely observes, that, "in order to settle in the world after a family-manner, he thought fit to marry while he was yet very[62:A] young;" language which seems to imply that _prudence_ was the prime motive with the youthful bard. Theobald proceeds still further, and declares "it is _probable_, a view of _interest_ might partly sway his conduct in this point: for he married the daughter of a _substantial_ yeoman in his neighbourhood, _and she had the start of him in age no less than eight

years_."[62:B] Capell, on the contrary, thinks that the marriage was contracted against the wishes of his father, whose displeasure was the consequence of their union.[62:C]

A moment's consideration of the character of Shakspeare will induce us to conclude that _interest_ could not be his _leading_ object in forming the matrimonial tie. In no stage of his subsequent life does a motive of this kind appear strongly to have influenced him; and it is well known, from facts which we shall have occasion shortly to record, that his juvenility at Stratford was marked, rather by carelessness and dissipation, than by the cool calculations of pecuniary wisdom. In short, to adopt, with slight variation, a line of his own, we may confidently assert that at this period,

"Love and Liberty crept in the mind and marrow of his youth." _Timon of Athens._

Neither can we agree with Mr. Capell in supposing that the father of our bard was averse to the connection; a supposition which he has built on the idea of old Mr. Shakspeare being "a man of no little substance," and that by this marriage of his son he was disappointed in a design which he had formed of sending him to an [62:D]University! Now it has been proved that John Shakspeare was, at this period, if not in distressed yet in embarrassed circumstances, and that neither the school-education of his son, nor his subsequent employment at home, could be such as was calculated in any degree to prepare him for an academical life.

We conclude, therefore, and certainly, with every probability on our side, that the young poet's attachment to Anne Hathaway was, not only perfectly disinterested, but had met likewise with the approbation of his parents. This will appear with more verisimilitude if we consider, in the first place, that though his bride were eight years older than himself, still she could be but in her twenty-sixth year, an age compatible with youth, and with the most alluring beauty; secondly, it does not appear that the finances of young Shakspeare were in the least improved by the connection; and thirdly, we know that he remained some years at Stratford after his marriage, which it is not likely that he would have done, had he been at variance with his father.

It is to be regretted, and it is indeed somewhat extraordinary, that not a fragment of the bard's poetry, addressed to his Warwickshire beauty, has been rescued from oblivion; for that the muse of Shakspeare did not lie dormant on an occasion so propitious to her inspiration we must believe, both from the costume of the times, and from his own amatory disposition. He has himself told us that

"Never durst poet touch a pen to write, Until his ink were temper'd with love's sighs."— _Love's Labour's Lost_, act iv. sc. 3.

and we have seen that an opportunity for qualification was very early placed within his power. That he availed himself of it, there can be no doubt; and had his effusions, on this occasion, descended to posterity, we should, in all probability, have been made acquainted with several interesting particulars relative to his early life and character, and to the person and disposition of his mistress.[63:A]

Our ignorance on this subject, however, would have been compensated, had any authentic documents been preserved relative to his establishment at Stratford, in consequence of his marriage; but of his domestic arrangements, of his business or professional employment, no information, or tradition to be depended upon, has reached us. We can only infer, from the evidence produced in the preceding chapter, and from the necessity, which must now have occurred, of providing for a family-establishment, that if, as we have reason to conclude, he had entered on the exercise of a branch of the manorial law, previous to his marriage, and with a view towards that event, he would, of course, be compelled, from prudential motives, to continue that occupation, after he had become a householder, and most probably to combine with it the business of a woolstapler, either on his own separate interest, or in concert with his father.

If any further incitement were wanting to his industry, it was soon imparted; for, to the claims upon him as a husband, were added, during the following year, those which attach to the name of a parent; his eldest child, Susanna, being born in May 1583, and baptized on the 26th of the same month. Thus, scarcely had our poet completed his nineteenth year, when the most serious duties of life were imperiously forced upon his attention, under circumstances perhaps of narrow fortune not altogether calculated to render their performance easy and pleasant; a situation which, on a superficial view, would not appear adapted to afford that leisure, that free and unincumbered state of intellect, so necessary to mental exertion; but with Shakspeare the pressure of these and of pecuniary difficulties served only to awaken that energy and elasticity of mind, which, ultimately directing his talents into their proper channel, called forth the brightest and most successful emanations of a genius nearly universal.

The family of the youthful bard gathered round him with rapidity; for, in 1584-5, it was increased by the birth of twins, a son and daughter, named Hamnet and Judith, who were baptized on February the 2d, of the same year.

The boy was christened by the name of Hamnet in compliment to his god-father Mr. Hamnet Sadler, and the girl was called Judith, from a similar deference to his wife, Mrs. Judith Sadler, who acted as her sponsor. Mr. Hamnet or Hamlet Sadler, for they were considered as synonymous names, and therefore used indiscriminately[65:A], appears to have been some relation of the Shakspeare family; he is one of the witnesses to Shakspeare's will, and is remembered in it in the following manner:—"_Item_, I give and bequeath to Hamlet Sadler twenty-six shillings eight-pence, to buy him a ring." Mr. Sadler died at Stratford in October 1624, and is supposed to have been born about the year 1550. His wife was buried there March 23. 1613-14, and Mr. Malone conjectures that our poet was probably god-father to their son _William_, who was baptized at Stratford, February 5. 1597-8.[65:B] In the Stratford Register are to be found entries of the baptism of six of Mr. Sadler's children, four sons and two daughters, William being the last but one.

An anecdote of Shakspeare, unappropriated to any particular period of his life, and which may with as much, if not more, probability, be ascribed to this stage of his biography, as to any subsequent era, has been preserved as a tradition at Stratford. A drunken blacksmith, with a carbuncled face, reeling up to Shakspeare, as he was leaning over a mercer's door, exclaimed, with much vociferation,

"Now, Mr. SHAKSPEARE, tell me, if you can, The difference between a youth and a young man:"

a question which immediately drew from our poet the following reply:

"Thou son of fire, with _thy face like a maple_, The same difference as between a scalded and a coddled apple."

A part of the wit of this anecdote, which, says Mr. Malone, "was related near fifty years ago to a gentleman at Stratford, by a person then above eighty years of age, whose father might have been contemporary with Shakspeare," turns upon the comparison between the blacksmith's face and a species of maple, the bark of which, according to Evelyn, is uncommonly rough, and the grain undulated and crisped into a variety of curls.

It would appear, indeed, from a book published in 1611, under the title of _Tarleton's Jeasts_, that this fancied resemblance was a frequent source of sarcastic wit; for it is there recorded of this once celebrated comedian, that, "as he was performing some part 'at the Bull in Bishopsgate-street, where the Queen's players oftentimes played,' while he was 'kneeling down to aske his father's blessing,' a fellow in the gallery threw an apple at him, which hit him on the cheek. He immediately took up the apple, and, advancing to the audience, addressed them in these lines:

'Gentlemen, this fellow, with _his face of mapple_, Instead of a pippin hath throwne me an apple; But as for an apple he hath cast a crab, So instead of an honest woman God hath sent him a drab.'

'The people,' says the relator, 'laughed heartily; for the fellow had a quean to his wife.'"[66:A]

Shakspeare was now, to all appearance, settled in the country; he was carrying on his own and his father's business; he was married and had a family around him; a situation in which the comforts of domestic privacy might be predicted within his reach, but which augured little of that splendid destiny, that universal fame and unparalleled celebrity, which awaited his future career.

In adherence, therefore, to the plan, which we have announced, of connecting the circumstances of the times with our author's life, we have chosen this period of it, as admirably adapted for the introduction of a survey of country life and manners, its customs, diversions and superstitions, as they existed in the age of Shakspeare. These, therefore, will be the subject of the immediately following chapters, in which it shall be our particular aim, among the numerous authorities to which we shall be obliged to have recourse, to draw from the poet himself those passages which throw light upon the topics as they rise to view; an arrangement which, when it shall have been carried, in all its various branches, through the work, will clearly show, that from Shakspeare, more than from any other poet, is to be collected the history of the times in which he lived, so far as that history relates to popular usage and amusement.

[63:A] Building on the high credibility of Shakspeare having employed his poetical talents, at this period, on the subject nearest to his heart, two ingenious gentlemen have been so obliging as not only to furnish him with words on this occasion, but to offer these to the world as the genuine product of his genius. It is scarcely necessary to add, that I allude to the Shakspeare Papers of young Ireland; and to a Tour in Quest of Genealogy, by a Barrister.

[65:A] Thus in the will of Shakspeare we read, "I give and bequeath to _Hamlet_ Sadler;" when at the close, Mr. Sadler as a witness writes his Christian name _Hamnet_. See Malone's note on this subject, Reed's Shakspeare, vol. i. p. 135.

CHAPTER V.

A VIEW OF COUNTRY LIFE DURING THE AGE OF SHAKSPEARE;—ITS MANNERS AND CUSTOMS.—RURAL CHARACTERS.

It may be necessary, in the commencement of this chapter, to remark, that rural life, in the strict acceptation of the term, will be at present the exclusive object of attention; a survey of the manners and customs of the metropolis, and of the superior orders of society, being deferred to a subsequent portion of the work.

No higher character will, therefore, be introduced in this sketch than the _country squire_, constituting according to Harrison, who wrote about the year 1580, one of the second order of gentlemen; for these, he remarks, "be divided into two sorts, as the baronie or estate of lords (which conteineth barons and all above that degree), and also those that be no lords, as knights, esquires, and simple gentlemen."[68:A] He has also furnished us, in another place, with a more precise definition of the character under consideration. "Esquire (which we call commonlie squire) is a French word, and so much in Latine as Scutiger vel Armiger, and such are all those which beare armes, or armoires, testimonies of their race from whence they be descended. They were at the first costerels or bearers of the armes of barons, or knights, and thereby being instructed in martiall knowledge, had that name for a dignitie given to distinguish them from common souldiers called Gregarii Milities when they were together in the field."[68:B]

It is curious to mark the minute distinctions of gentlemen as detailed at this period, in the various books of _Armorie_ or _Heraldrie_. The science, indeed, was cultivated, in the days of Shakspeare, with an enthusiasm which has never since been equalled, and the treatises on the subject were consequently multitudinous.

"—— If no gentleman, why then no arms,"[69:A]

exclaims our poet; the aspirants, therefore, to this distinction were numerous, and in the _Gentleman's Academie_; or, _The Booke of St. Albans_, published by Gervase Markham in 1595, which he says in the dedication was _then_ absolutely "necessarie and behovefull to the accomplishment of the gentlemen of this flourishing ile—in the heroicall and excellent study of Armory," we find "nine sortes" and "foure maner" of gentlemen expressly distinguished.

"Of nine sortes of gentlemen:

"First, there is a gentleman of ancestry and blood.

"A gentleman of blood.

"A gentleman of coat-armour, and those are three, one of the kings badge, another of lordship, and the third of killing a pagan.

"A gentleman untriall: a gentleman Ipocrafet: a gentleman spirituall and temporall: there is also a gentleman spirituall and temporall.—

"The divers manner of gentlemen:

"There are foure maner of gentlemen, to wit, one of auncestrie, which must needes bee of blood, and three of coate-armour, and not of blood: as one a gentleman of coate-armour of the kings badge, which is of armes given him by an herauld: another is, to whome the king giveth a lordeshippe, to a yeoman by his letters pattents, and to his heires for ever, whereby hee may beare the coate-armour of the same lordeshippe: the thirde is, if a yeoman kill a gentleman, Pagan or Sarazen, whereby he may of right weare his coate-armour: and some holde opinion, that if one Christian doe kill an other, and if it be lawfull battell, they may weare each others coate-armour, yet it is not so good as where the Christian killes the Pagan."

We have also the virtues and vices proper or contrary to the character of the gentleman, the former of which are divided into five amorous and four sovereign: "the five amorous are these,—lordly of countenance, sweet in speech, wise in answere, perfitte in government and cherefull to faithfulnes: the foure soveraigne are these fewe,—oathes are no swearing, patient in affliction, knowledge of his owne birth, and to feare to offend his soveraigne."[70:A] The vices which are likewise enumerated as _nine_, are all modifications of cowardice, lechery, and drunkenness.

That the character of the gentleman was still estimated, in the reign of Elizabeth, according to this definition of the Prioress of Sopewell, we have consequently the authority of Markham to assert, who tells us, that the study of his modernised edition of the Booke of St. Albans was still "behovefull to the accomplishment of the gentleman" of 1595.

The mansion-houses of the country-gentlemen were, in the days of Shakspeare, rapidly improving both in their external appearance, and in their interior comforts. During the reign of Henry the Eighth, and even of Mary, they were, if we except their size, little better than cottages, being thatched buildings, covered on the outside with the coarsest clay, and lighted only by lattices; when Harrison wrote, in the age of Elizabeth, though the greater number of manor-houses still remained framed of timber, yet he observes, "such as be latelie builded, are c■monlie either of bricke or hard stone, or both; their roomes large and comelie, and houses of office further distant from their lodgings."[72:A] The old timber mansions, too, were now covered with the finest plaster, which, says the historian, "beside the delectable whitenesse of the stuffe itselfe, is laied on so even and smoothlie, as nothing in my judgment can be done with more exactnesse[73:A]:" and at the same time, the windows, interior decorations, and furniture were becoming greatly more useful and elegant. "Of old time our countrie houses," continues Harrison, "instead of glasse did use much lattise, and that made either of wicker or fine rifts of oke in chekerwise. I read also that some of the better sort, in and before the time of the Saxons, did make panels of horne insteed of glasse, and fix them in woodden calmes. But as horne in windows is now quite laid downe in everie place, so our lattises are also growne into lesse use, because glasse is come to be so plentifull, and within a verie little so good cheape if not better then the other.—The wals of our houses on the inner sides in like sort be either hanged with tapisterie, arras worke, or painted cloths, wherein either diverse histories, or hearbes, beasts, knots, and such like are stained, or else they are seeled with oke of our owne, or wainescot brought hither out of the east countries, whereby the roomes are not a little commanded, made warme, and much more close than otherwise they would be. As for stooves we have not hitherto used them greatlie, yet doo they now begin to be made in diverse houses of the gentrie.—Likewise in the houses of knights, gentlemen, &c. it is not geson to behold generallie their great provision of Turkie worke, pewter, brasse, fine linen, and thereto costlie cupbords of plate, worth five or six hundred or a thousand pounds, to be deemed by estimation."[73:B]

The house of every country-gentleman of property included a neat chapel and a spacious hall; and where the estate and establishment were considerable, the mansion was divided into two parts or sides, one for the state or banqueting-rooms, and the other for the household; but in general, the latter, except in baronial residences, was the only part to be met with, and when complete had the addition of parlours; thus Bacon, in his Essay on Building, describing the houshold side of a mansion, says, "I wish it divided at the first into a hall, and a chappell, with a partition betweene; both of good state and bignesse: and those not to goe all the length, but to have, at the further end, a winter, and a summer parler, both faire: and under these roomes a faire and large cellar, sunke under ground: and likewise, some privie kitchins, with butteries and pantries, and the like."[74:A] It was the custom also to have windows opening from the parlours and passages into the chapel, hall, and kitchen, with the view of overlooking or controlling what might be going on; a trait of vigilant caution, which may still be discovered in some of our ancient colleges and manor-houses, and to which Shakspeare alludes in King Henry the Eighth, where he describes His Majesty and Butts the physician entering at a window above, which overlooks the council-chamber.[74:B] We may add, in illustration of this system of architectural espionage, that Andrew Borde, when giving instructions for building a house in his _Dietarie of Health_, directs "many of the chambers to have a view into the chapel:" and that Parker, Archbishop of Canterbury, in a letter, dated 1573, says, "if it please Her Majestie, she may come in through my gallerie, and see the disposition of the hall in dynner-time, at _a window opening thereunto_."[74:C]

The hall of the country-squire was the usual scene of eating and hospitality, at the upper end of which was placed the orsille or high table, a little elevated above the floor, and here the master of the mansion presided, with an authority, if not a state, which almost equalled that of the potent baron. The table was divided into upper and lower messes, by a huge saltcellar, and the rank and consequence of the visitors were marked by the situation of their seats above, and below, the saltcellar; a custom which not only distinguished the relative dignity of the guests, but extended likewise to the nature of the provision, the wine frequently circulating only above the saltcellar, and the dishes below it, being of a coarser kind than those near the head of the table. So prevalent was this uncourteous distinction, that Shakspeare, in his Winter's Tale, written about the year 1604, or 1610, designates the inferior orders of society by the term "_lower messes_."

——————————— "Lower messes, Perchance, are to this business purblind."[75:A]

Dekkar, likewise, in his play called _The Honest Whore_, 1604, mentions in strong terms the degradation of sitting beneath the salt: "Plague him, set him beneath the salt; and let him not touch a bit, till every one has had his full cut."[75:B] Hall too, in the sixth satire of his second book, published in 1597, when depicting the humiliated state of the squire's chaplain, says, that he must not

"ever presume to sit _above the salt_:"

and Jonson, in his Cynthia's Revells, speaking of a coxcomb, says, "his fashion is, not to take knowledge of him that is beneath him in clothes. He never drinkes _below the salt_." See act i. sc. 2.

This invidious regulation appears to have extended far into the seventeenth century; for Massinger in his _City Madam_, acted in 1632, thus notices it:

———————— "My proud lady Admits him to her table, marry, ever _Beneath the salt_, and there he sits the subject Of her contempt and scorn:"[75:C]

and Cartright still later:

——— "Where you are best esteem'd, You only pass under the favourable name Of humble cousins that sit _beneath the salt_." _Love's Convert._

The luxury of eating and of good cooking were well understood in the days of Elizabeth, and the table of the country-squire frequently groaned beneath the burden of its dishes; at Christmas and at Easter especially, the hall became the scene of great festivity; "in gentlemen's houses, at Christmas," says Aubrey, "the first dish that was brought to table was a boar's head, with a lemon in his mouth. At Queen's Coll. Oxon. they still retain this custom, the bearer of it bringing it into the hall, singing to an old tune an old Latin rhyme, _Apri caput defero, &c._ The first dish that was brought up to table on Easter-day was a red-herring riding away on horseback; _i. e._ a herring ordered by the cook something after the likeness of a man on horseback, set in a corn sallad. The custom of eating a gammon of bacon at Easter (which is still kept up in many parts of England) was founded on this, _viz._ to shew their abhorrence of Judaism at that solemn commemoration of our Lord's resurrection."[76:A]

Games and diversions of various kinds, such as mumming, masqueing, dancing, loaf-stealing, &c. &c. were allowed in the hall on these days; and the servants, or heralds, wore the coats of arms of their masters, and cried '_Largesse_' thrice. The hall was usually hung round with the insignia of the squire's amusements, such as hunting, shooting, fishing, &c.; but in case he were a justice of the peace, it assumed a more terrific aspect. "The halls of the justice of peace," observes honest Aubrey, "were dreadful to behold. The skreen was garnished with corslets and helmets, gaping with open mouths, with coats of mail, launces, pikes, halberts, brown bills, bucklers."[76:B]

The following admirable description of an old English hall, which still remains as it existed in the days of Elizabeth, is taken from the notes to Mr. Scott's recent poem of Rokeby, and was communicated to the bard by a friend; the story which it introduces, I have also added, as it likewise occurred in the same reign, and affords a curious though not a pleasing trait of the manners of the times; as, while it gives a dreadful instance of ferocity, it shows with what ease justice, even in the case of the most enormous crimes, might be set aside.

Littlecote-House stands in a low and lonely situation. On three sides it is surrounded by a park that spreads over the adjoining hill; on the fourth, by meadows which are watered by the river Kennet. Close on one side of the house is a thick grove of lofty trees, along the verge of which runs one of the principal avenues to it through the park. It is an irregular building of great antiquity, and was probably erected about the time of the termination of feudal warfare, when defence came no longer to be an object in a country-mansion. Many circumstances in the interior of the house, however, seem appropriate to feudal times. The hall is very spacious, floored with stones, and lighted by large transom windows, that are clothed with casements. Its walls are hung with old military accoutrements, that have long been left a prey to rust. At one end of the hall is a range of coats of mail and helmets, and there is on every side abundance of old-fashioned pistols and guns, many of them with matchlocks. Immediately below the cornice hangs a row of leathern jerkins, made in the form of a shirt, supposed to have been worn as armour by the vassals. A large oak-table, reaching nearly from one end of the room to the other, might have feasted the whole neighbourhood, and an appendage to one end of it made it answer at other times for the old game of shuffle-board. The rest of the furniture is in a suitable style, particularly an arm-chair of cumbrous workmanship, constructed of wood, curiously turned, with a high back and triangular seat, said to have been used by Judge Popham in the reign of Elizabeth. The entrance into the hall is at one end by a low door, communicating with a passage that leads from the outer door, in the front of the house, to a quadrangle within; at the other it opens upon a gloomy staircase, by which you ascend to the first floor, and, passing the doors of some bed-chambers, enter a narrow gallery, which extends along the back front of the house from one end to the other of it, and looks upon an old garden. This gallery is hung with portraits, chiefly in the Spanish dresses of the sixteenth century. In one of the bed-chambers, which you pass in going towards the gallery, is a bedstead with blue furniture, which time has now made dingy and threadbare, and in the bottom of one of the bed-curtains you are shewn a place where a small piece has been cut out and sown in again; a circumstance which serves to identify the scene of the following story:

"It was a dark rainy night in the month of November, that an old midwife sate musing by her cottage fire-side, when on a sudden she was startled by a loud knocking at the door. On opening it she found a horseman, who told her that her assistance was required immediately by a person of rank, and that she should be handsomely rewarded, but that there were reasons for keeping the affair a strict secret, and, therefore, she must submit to be blind-folded, and to be conducted in that condition to the bed-chamber of the lady. After proceeding in silence for many miles through rough and dirty lanes, they stopped, and the midwife was led into a house, which, from the length of her walk through the apartment, as well as the sounds about her, she discovered to be the seat of wealth and power. When the bandage was removed from her eyes, she found herself in a bed-chamber, in which were the lady on whose account she had been sent for, and a man of a haughty and ferocious aspect. The lady was delivered of a fine boy. Immediately the man commanded the midwife to give him the child, and, catching it from her, he hurried across the room, and threw it on the back of the fire, that was blazing in the chimney. The child, however, was strong, and by its struggles rolled itself off upon the hearth, when the ruffian again seized it with fury, and, in spite of the intercession of the midwife, and the more piteous entreaties of the mother, thrust it under the grate, and raking the live coals upon it, soon put an end to its life. The midwife, after spending some time in affording all the relief in her power to the wretched mother, was told that she must be gone. Her former conductor appeared, who again bound her eyes, and conveyed her behind him to her own home; he then paid her handsomely, and departed. The midwife was strongly agitated by the horrors of the preceding night; and she immediately made a deposition of the fact before a magistrate. Two circumstances afforded hopes of detecting the house in which the crime had been committed; one was, that the midwife, as she sate by the bed-side, had, with a view to discover the place, cut out a piece of the bed-curtain, and sown it in again; the other was, that as she had descended the staircase, she had counted the steps. Some suspicions fell upon one Darrell, at that time the proprietor of Littlecote-House and the domain around it. The house was examined, and identified

by the midwife, and Darrell was tried at Salisbury for the murder. By corrupting his judge, he escaped the sentence of the law; but broke his neck by a fall from his horse in hunting, in a few months after. The place where this happened is still known by the name of Darrell's Hill: a spot to be dreaded by the peasant whom the shades of evening have overtaken on his way.

"Littlecote-House is two miles from Hungerford, in Berkshire, through which the Bath road passes. The fact occurred in the reign of Elizabeth. All the important circumstances I have given exactly as they are told in the country." Rokeby, 4to. edit. notes, p. 102-106.

The usual fare of country-gentlemen, relates Harrison, was "foure, five, or six dishes, when they have but _small resort_;" and accordingly, we find that Justice Shallow, when he invites Falstaffe to dinner, issues the following orders: "Some pigeons, Davy; a couple of short-legged hens; a joint of mutton; and any pretty little tiny kickshaws, tell William Cook."[79:A] But on feast-days, and particularly on the festivals above-mentioned, the profusion and cost of the table were astonishing. Harrison observes that the country-gentlemen and merchants contemned butchers meat on such occasions, and vied with the nobility in the production of rare and delicate viands, of which he gives a long list[79:B]; and Massinger says,

"Men may talk of _country-christmasses_— Their thirty-pound butter'd eggs, their pies of carps tongues, Their pheasants drench'd with ambergris, the carcases Of three fat wethers bruised for gravy, to Make sauce for a single peacock; yet their feasts Were fasts, compared with the city's."[80:A]

It was the custom in the houses of the country-gentlemen to retire after dinner, which generally took place about eleven in the morning, to the garden-bower or an arbour in the orchard, in order to partake of the banquet or dessert; thus Shallow, addressing Falstaffe after dinner, exclaims, "Nay, you shall see mine orchard: where, in an _arbour_, we will eat a last year's pippin of my own graffing, with a dish of carraways, and so forth."[80:B] From the banquet it was usual to retire to evening prayer, and thence to supper, between five and six o'clock; for in Shakspeare's time, there were seldom more than two meals, dinner and supper; "heretofore," remarks Harrison, "there hath beene much more time spent in eating and drinking than commonlie is in these daies, for whereas of old we had breakfasts in the forenoone, beverages, or nuntions after dinner, and thereto reare suppers generallie when it was time to go to rest. Now these od repasts, thanked be God, are verie well left, and ech one in manner (except here and there some yoong hungrie stomach that cannot fast till dinner time) contenteth himselfe with dinner and supper onelie. The nobilitie, _gentlemen_, and merchantmen, especiallie at great meetings, doo sit commonlie till two or three of the clocke at afternoone, so that with manie is an hard matter to rise from the table to go to evening praier, and returne from thence to come time enough to supper."[81:A]

The supper which, on days of festivity, was often protracted to a late hour, and often too as substantial as the dinner, was succeeded, especially at Christmas, by gambols of various sorts, and sometimes the squire and his family would mingle in the amusements, or retiring to the tapestried parlour, would leave the hall to the more boisterous mirth of their household; then would the BLIND HARPER, who sold his _FIT of mirth for a groat_, be introduced, either to provoke the dance, or to rouse their wonder by his minstrelsy; his "matter being for the most part stories of old time, as the tale of Sir Topas, the reportes of Bevis of Southampton, Guy of Warwicke, Adam Bell, and Clymme of the Clough, and such other old romances or historical rimes, made purposely for recreation of the common people at Christmasse dinners and brideales."[81:B] Nor was the evening passed by the parlour fire-side dissimilar in its pleasures; the harp of history or romance was frequently made vocal by one of the party. "We ourselves," says Puttenham, who wrote in 1589, "have written for pleasure a little brief romance, or historical ditty, in the English tong of the Isle of Great Britaine, in short and long meetres, and by breaches or divisions, to be more commodiously sung to the harpe in places of assembly, where the company shal be desirous to heare of old adventures, and valiaunces of noble knights in times past, as are those of King Authur and his Knights of the Round Table, Sir Bevys of Southampton, Guy of Warwicke, and others like."[81:C]

The _posset_ at bed-time, closed the joyous day, a custom to which Shakspeare has occasionally alluded; thus Lady Macbeth says of the "surfeited grooms," "I have drugg'd their possets[82:A];" Mrs. Quickly tells Rugby, "Go; and we'll have a posset for't soon at night, in faith, at the latter end of a sea-coal fire[82:B];" and Page, cheering Falstaffe, exclaims, "Thou shall eat a posset to-night at my[82:C] house." Thomas Heywood also, a contemporary of Shakspeare, has particularly noticed this refection as occurring just before bed-time: "Thou shall be welcome to beef and bacon, and perhaps a bag-pudding; and my daughter Nell shall pop a _posset_ upon thee when thou goest to bed."[82:D]

In short, hospitality, a love of festivity, and an ardent attachment to the sports of the field, were prominent traits in the character of the country-gentleman in Shakspeare's days. The floor of his hall was commonly occupied by his greyhounds, and on his hand was usually to be found his favorite hawk. His conversation was very generally on the subject of his diversions; for as Master Stephen

says, "Why you know, an'a man have not skill in the hawking and hunting languages now-a-dayes, I'll not give a rush for him. They are more studied than the _Greeke_, or the _Latine_."[82:E] Classical acquirements were, nevertheless, becoming daily more fashionable and familiar with the character which we are describing; but still an intimacy with heraldry, romance, and the chroniclers, constituted the chief literary wealth of the country-gentleman. In his dress he was plain, though occasionally costly; yet Harrison complains in 1580, that the gaudy trappings of the French were creeping even into the rural and mercantile world: "Neither was it merrier," says he, "with England, than when an Englishman was knowne abroad by his owne cloth, and contented himselfe at home with his fine carsie hosen, and a meane slop: his coat, gowne, and cloak of browne, blue, or puke, with some pretie furniture of velvet or furre, and a doublet of sad tawnie, or blacke velvet, or other comelie silke, without such cuts and gawrish colours as are worne in these daies, and never brought in but by the consent of the French, who thinke themselves the gaiest men, when they have most diversities of jagges and change of colours about them."[83:A]

Of the female part of the family of the country-gentleman, we must be indulged in giving one description from Drayton, which not only particularizes the employments and dress of the younger part of the sex, but is written with the most exquisite simplicity and beauty; he is delineating the well-educated daughter of a country-knight:

"He had, as antique stories tell, A daughter cleaped Dawsabel, A maiden fair and free: And for she was her father's heir, Full well she was ycond the leir Of mickle courtesy.

The silk well couth she twist and twine, And make the fine march-pine, And with the needle work: And she couth help the priest to say His mattins on a holy day, And sing a psalm in kirk.

She wore a frock of frolic green, Might well become a maiden queen, Which seemly was to see; A hood to that so neat and fine, In colour like the columbine, Ywrought full featously.

Her features all as fresh above, As is the grass that grows by Dove, And lythe as lass of Kent. Her skin as soft as Lemster wool, As white as snow on Peakish Hull, Or swan that swims in Trent.

This maiden in a moon betime, Went forth when May was in the prime, To get sweet setywall, The honey-suckle, the harlock, The lily, and the lady-smock, To deck her summer-hall."[84:A]

Some heightening to the picture of the country-gentleman which we have just given, may be drawn from the character of the upstart squire or country-knight, as it has been pourtrayed by Bishop Earle, towards the commencement of the seventeenth century; for the absurd imitation of the one is but an overcharged or caricature exhibition of the costume of the other. The upstart country-gentleman, remarks the Bishop, "is a holiday clown, and differs only in the stuff of his clothes, not the stuff of himself, for he bare the kings sword before he had arms to wield it; yet being once laid o'er the shoulder with a knighthood, he finds the herald his friend. His father was a man of good stock, though but a tanner or usurer; he purchased the land, and his son the title. He has doffed off the name of a country-fellow, but the look not so easy, and his face still bears a relish of churne-milk. He is guarded with more gold lace than all the gentlemen of the country, yet his body makes his clothes still out of fashion. His house-keeping is seen much in the distinct families of dogs, and serving-men attendant on their kennels, and the deepness of their throats is the depth of his discourse. A hawk he esteems the true burden of nobility, and is exceeding ambitious to seem delighted in the sport, and have his fist gloved with his [84:B]jesses. A justice of peace he is to domineer in his parish, and do his neighbour wrong with more right. He will be drunk with his hunters for company, and stain his gentility with droppings of ale. He is fearful of being sheriff of the shire by instinct, and dreads the assize-week as much as the prisoner. In sum, he's but a clod of his own earth, or his land is the dunghill and he the cock that crows over it: and commonly his race is quickly run, and his children's children, though they scape hanging, return to the place from whence they came."[85:A]

Notwithstanding the hospitality which generally prevailed among the country-gentlemen towards the close of the sixteenth century, the injurious custom of deserting their hereditary halls for the luxury and dissipation of the metropolis, began to appear; and, accordingly, Bishop Hall has described in a most finished and picturesque manner the deserted mansion of his days;

"Beat the broad gates, a goodly hollow sound With double echoes doth againe rebound; But not a dog doth bark to welcome thee, Nor churlish porter canst thou chafing see: All dumb and silent, like the dead of night, Or dwelling of some sleepy Sybarite! The marble pavement hid with desert weed, With house-leek, thistle, dock, and hemlock-seed.— Look to the towered chimnies, which should be The wind-pipes of good hospitalitie:—— Lo, there th'unthankful swallow takes her rest, And fills the tunnel with her circled nest."[85:B]

That it was no very uncommon thing for country-gentlemen to spend their Christmas in London at this period, is evident from a letter preserved by Mr. Lodge, in his Illustrations of British History; it is written by William Fleetwood, afterwards Queen's Serjeant, to the Earl of Derby; is dated New Yere's Daye, 1589, and contains the following passage:—"The gentlemen of Norff. and Suffolk were commanded to dep{r}te from London before Xtemmas, and to repaire to their countries, and there to kepe hospitalitie amongest their neighbours.[86:A]" The fashion, however, of annually visiting the capital did not become general, nor did the character of the country-squire, such as it was in the days of Shakspeare, alter materially during the following century.[86:B]

The _country-clergyman_, the next character we shall attempt to notice, was distinguished, in the time of Shakspeare, by the appellation of _Sir_: a title which the poet has uniformly bestowed on the inferior orders of this profession, as _Sir_ Hugh in the Merry Wives of Windsor, _Sir_ Topas in the Twelfth Night, _Sir_ Oliver in As You like It, and _Sir_ Nathaniel in Love's Labour's lost. This custom, which was not entirely discontinued until the close of the reign of Charles II., owes its origin to the language of our universities, which confers the designation of _Dominus_ on those who have taken their first degree or bachelor of arts, and not, as has been supposed, to any claim which the clergy had upon the order of knighthood. The word _Dominus_ was naturally translated _Sir_; and as almost every clergyman had taken his first degree, it became customary to apply the term to the lower class of the hierarchy. "_Sir_ seems to have been a title," remarks Dr. Percy, "formerly appropriated to such of the inferior clergy as were only _readers_ of the service, and not admitted to be preachers, and therefore were held in the lowest estimation, as appears from a remarkable passage in Machell's MS. _Collections for the History of Westmoreland and Cumberland_, in six volumes, folio, preserved in the Dean and Chapter's library at Carlisle. The Rev. Thomas Machell, author of the Collections, lived temp. Car. II. Speaking of the little chapel of Martindale in the mountains of Westmoreland and Cumberland, the writer says, 'There is little remarkable in or about it, but a neat chapel yard, which, by the peculiar care of the old reader, _Sir Richard_[89:A], is kept clean, and as neat as a bowling-green.'

"Within the limits of myne own memory all _readers_ in chapels were called _Sirs_[89:B], and of old have been writ so; whence, I suppose, such of the laity as received the noble order of knighthood being called _Sirs_ too, for distinction sake had _Knight_ writ after them; which had been superfluous, if the title _Sir_ had been peculiar to them."[90:A]

Shakspeare has himself indeed sufficiently marked the distinction between priesthood and knighthood, when he makes Viola say, "I am one that had rather go with _Sir Priest_ than _Sir Knight_."[90:B]

Were we to estimate the diameter of the country-clergy, during the age of Elizabeth, from the sketches which Shakspeare has given us of them, I am afraid we should be induced to appreciate their utility and moral virtue on too low a scale. It will be a fairer plan to exhibit the picture from the delineation of one of their own order, a competent judge, and who was likewise a contemporary. "The apparell of our clergiemen," records Harrison, "is comlie, and, in truth, more decent than ever it was in the popish church: before the universities bound their graduats unto a stable attire, afterward usurped also even by the blind Sir Johns. For if you peruse well my chronolojie, you shall find, that they went either in diverse colors, like plaiers, or in garments of light hew, as yellow, red, greene, &c.: with their shoes piked, their haire crisped, their girdles armed with silver; their shoes, spurres, bridles, &c. buckled with like metall: their apparell (for the most part) of silke, and richlie furred; their cappes laced and butned with gold: so that to meet a priest in those daies, was to behold a peacocke that spreadeth his taile when he danseth before the henne: which now (I saie) is well reformed. Touching hospitalitie, there was never any greater used in England, sith by reason that marriage is permitted to him that will choose that kind of life, their meat and drinke is more orderly and frugallie dressed; their furniture of houshold more convenient, and better looked unto; and the poore oftener fed generallie than heretofore they have beene." Then, alluding to those who reproach the country-clergy for not being so prodigal of good cheer as in former days, he adds, "To such as doo consider of the curtailing of their livings, or excessive prices wherevnto things are growen, and how their course is limited by law, and estate looked into on every side, the cause of their so dooing is well inough perceived. This also offendeth manie, that they should after their deaths leave their substances to their wives and children: whereas they consider not, that in old time such as had no lemans nor bastards (verie few were there God wot of this sort) did leave their goods and possessions to their brethren and kinsfolk, whereby (as I can shew by good record) manie houses of gentilitie have growen and beene erected. If in anie age some one of them did found a college, almes-house, or schoole, if you looke unto these our times, you shall see no fewer deeds of charitie doone, nor better grounded upon the right stub of pietie than before. If you saie that their wives be fond, after the decease of their husbands, and bestow themselves not so advisedlie as their calling requireth, which God knoweth these curious surveiors make small accompt of in truth, further than thereby to gather matter of reprehension: I beseech you then to look into all states of the laitie, and tell me whether some duchesses, countesses, barons, or knights' wives, doo not fullie so often offend in the like as they: for Eve will be Eve, though Adam would saie naie. Not a few also find fault with our thread-bare gowns, as if not our patrons but our

wives were causes of our wo: but if it were knowne to all, that I know to have beene performed of late in Essex, where a minister taking a benefice (of lesse than twentie pounds in the Quéen's bookes so farre as I remember) was inforced to paie to his patrone, twentie quarters of otes, ten quarters of wheat, and sixtéene yéerlie of barleie, which he called hawkes-meat; and another left the like in farme to his patrone forten pounds by the yéere, which is well worth fortie at the least, the cause of our thread-bare gowns would easilie appeere, for such patrones doo scrape the wooll from our clokes."[91:A]

This delineation is, upon the whole, a favourable one; but the author in the very next page admits that the country-clergy had notwithstanding fallen into "general contempt" and "small consideration;" that the cause of this was not merely owing to the poverty of the ministry, but was for the most part attributable either to the iniquity of the patron or the immorality of the priest, will but too clearly appear from the relation of Harrison himself, and from other contemporary evidence. The historian declares that it was the custom of some patrons to "bestow advowsons of benefices upon their bakers, butlers, cookes, good archers, falconers, and horsekéepers, insted of other recompence for their long and faithfull service[92:A];" and the following letter from the Talbot papers presents us with a frightful view of the manners of the country-clergy at the commencement of the reign of James I.

"Ad. Slack to the Lady Bowes.

"Right wor{ll}.

"I understand that one Raphe Cleaton ys curate of the chappell at Buxton; his wages are, out of his neighbour's benevolence, about v{li} yearely: S{r} Charles Cavendishe had the tythes there this last yeare, ether of his owne right or my Lords, as th' inhabitants saye. The minister aforenamed differeth litle from those of the worste sorte, and hath dipt his finger both in manslaughter and p'jurie, &c. The placinge or displacing of the curate there resteth in Mr. Walker, commissarie of Bakewell, of which churche Buxton is a chappell of ease.

"I humbly thanke yo{r} Wor{pp} for yo{re} l{re} to the justices at the cessions; for S{r} Peter Fretchvell, togither w{th} Mr. Bainbrigg, were verie earnest against the badd vicar of Hope; and lykewyse S{r} Jermane Poole, and all the benche, savinge Justice Bentley, who use some vaine —— on his behalfe, and affirmed that my La. Bowes had been disprooved before My Lord of Shrowesburie in reports touching the vicar of Hope; but such answere was made therto as his mouthe was stopped: yet the latter daie, when all the justic's but himselffe and one other were rysen, he wold have had the said vicar lycensed to sell ale in his vicaredge, althoe the whole benche had comanded the contrarye; whereof S{r} Jermane Poole being adv'tised, retyrned to the benche (contradicting his speeche) whoe, w{th} Mr. Bainbrigge, made their warrant to bringe before them, him, or anie other person that shall, for him, or in his vicaridge, brue, or sell ale, &c. He ys not to bee punished by the Justices for the multytude of his women, untyll the basterds whereof he is the reputed father bee brought in. I am the more boulde to wryte so longe of this sorrie matter, in respect you maye take so much better knowledge of S{r} Jo. Bentley, and his p'tialytie in so vile a cause; and esteeme and judge of him accordinge to y{r} wisdome and good discretion. Thus, humbly cravinge p'don, I com■itt y{r} good Wors. to the everlasting Lorde, who ever keepe you. This 12th of Octob. 1609.

"Yo{r} La' humble poore tenant, at comandm{t}.

"AD. SLACK.[93:A]

"To the right wor{ll} my good Ladie, the La. Bowes of Walton, geive theise."

That men who could thus debase themselves should be held in little esteem, and their services ill requited, cannot excite our wonder; and we consequently read without surprise, that in the days of Elizabeth, the minstrel and the cook were often better paid than the priest;—thus on the books of the Stationers' Company for the year 1560, may be found the following entry:

_s._ _d._ "Item, payd to the preacher vi 2 Item, payd to the minstrell xij 0 Item, payd to the coke xv 0"[93:B]

Let us not conclude, however, that the age of Shakspeare was without instances of a far different kind, and that religion and virtue were altogether excluded from what ought to have been their most favoured abode; it will be sufficient to mention the name of _Bernard Gilpin_, the most exemplary of parish-priests, whose humility, benevolence, and exalted piety were never exceeded, and whose ministerial labours were such as to form a noble contrast to the shameful neglect of the pastoral care which existed around him. Indeed we are inclined to infer, notwithstanding the numerous individual instances of profligacy and dissipation which may be brought forward, that the country clergy then, as now, if considered in the aggregate, possessed more real virtue and utility than any other equally numerous body of men; but that aberrations from the stricter decency of their order were, as is still very properly

the case in the present day, marked with avidity, and censured with abhorrence. To the younger clergy in the country, also, was frequently committed the task of education, a labour of unspeakable importance, but in the period of which we are writing, attended too often with the most undeserved contumely and contempt. In the Scholemaster of Ascham may be found the most bitter complaints of the barbarous and disgraceful treatment of the able instructor of youth; and the following sketches of the clerical tutor from Peacham and Hall, will still further heighten and authenticate the picture. The former of these writers observes, "Such is the most base and ridiculous parsimony of many of our Gentlemen, (if I may so terme them) that if they can procure some poore Batchelor of Art from the Universitie to teach their children to say grace, and serve the cure of an impropriation, who wanting meanes and friends, will be content upon the promise of ten pounds a yeere at his first comming, to be pleased with five; the rest to be set off in hope of the next advouson, (which perhaps was sold before the young man was borne): Or if it chance to fall in his time, his lady or master tels him; 'Indeed Sir we are beholden unto you for your paines, such a living is lately falne, but I had before made a promise of it to my butler or bailiffe, for his true and extraordinary service.'

"Is it not commonly seene, that the most Gentlemen will give better wages, and deale more bountifully with a fellow who can but a dogge, or reclaime a hawke, than upon an honest, learned, and well qualified man to bring up their children? It may be, hence it is, that dogges are able to make syllogismes in the fields, when their young masters can conclude nothing at home, if occasion of argument or discourse be offered at the table."[95:A]

The domestic chaplain of Bishop Hall is touched with a glowing pencil, and while it faithfully exhibits the servile and depressed state of the poor tutor, is, at the same time, wrought up with much point and humour.

"A gentle squire would gladly entertaine Into his house some trencher-chapelaine; Some willing man, that might instruct his sons. And that would stand to good conditions. First, that he lie upon the truckle-bed, While his young maister lieth o'er his head: Second, that he do, upon no default, Never presume to sit above the salt: Third, that he never change his trencher twise; Fourth, that he use all common courtesies; Sit bare at meales, and one half rise and wait: Last, that he never his young maister beat; But he must aske his mother to define How manie jerks she would his breech should line. All these observ'd, he could contented be, To give five markes, and winter liverie."[95:B]

From the description of the character of the country clerical tutor, it is an easy transition to that of the _rural pedagogue or schoolmaster_, a personage of not less consequence in the days of Elizabeth, than in the present period. He frequently combined, indeed, in the sixteenth century, the reputation of a conjuror with that of a schoolmaster, and accordingly in the _Comedy of Errors_, _Pinch_, in the dramatis personæ, is described as "a schoolmaster, and a conjuror," and the following not very amiable portrait of his person is given towards the conclusion of the play:—

"They brought one Pinch; a hungry lean-faced villain, A meer anatomy, a mountebank, A thread-bare juggler, and a fortune-teller; A needy, hollow-eye'd, sharp-looking wretch, A living dead man: this pernicious slave, Forsooth, took him on as conjuror."[96:A]

Ben Jonson also alludes to this union of occupations when he says, "I would have ne'er a cunning _schoolemaster_ in England, I mean a Cunningman as a schoolemaster; that is, a Conjurour."[96:B]

A less formidable figure of a schoolmaster has been given us by Shakspeare, under the character of Holofernes, in _Love's Labour's Lost_, where he has drawn a full-length caricature of the too frequent pedantry of this profession. Yet Holofernes, though he speak _a leash of languages at once_, is not deficient either in ability or discrimination; he ridicules with much good sense and humour the literary fops of his day, the "rackers of orthography;" and his conversation is described by his friend, Sir Nathaniel, the Curate, as possessing all the requisites to perfection. "Sir: your reasons at dinner have been sharp and sententious; pleasant without scurrility, witty without affection, audacious without impudency, learned without opinion, and strange without heresy."[96:C] "It is very difficult," remarks Dr. Johnson, "to add any thing to this character of the schoolmaster's table-talk, and perhaps all the precepts of Castiglione will scarcely be found to comprehend a rule for conversation so justly delineated, so widely dilated, and so nicely limited."[96:D]

The country-schoolmasters in the reigns of Elizabeth and James, were, however, if we trust to the accounts of Ascham and Peacham, in general many degrees below the pedagogue of Shakspeare in ability; tyranny and ignorance appear to have been their chief characteristics; to such an extent, indeed, were they deficient in point of necessary knowledge, that Peacham, speaking of bad masters, declares, "it is a generall plague and complaint of the whole land; for, for one discreet and able teacher, you shall finde twenty ignorant and carelesse; who (among so many fertile and delicate wits as _England_ affordeth) whereas they make one scholler, they marre ten."[97:A]

Ascham had endeavoured, by every argument and mode of persuasion in his power, to check the severe and indiscriminate discipline which prevailed among the teachers in his time; it would seem in vain; for Peacham, about the year 1620, found it necessary to recommend lenity in equally strenuous terms, and has given a minute and we have no doubt a faithful picture of the various cruelties to which scholars were then subjected; a summary of the result of this conduct may be drawn, indeed, from his own words, where he says, "Masters for the most part so behave themselves, that their very name is hatefull to the scholler, who trembleth at their comming in, rejoyceth at their absence, and looketh his master (returned) in the the face, as his deadly enemy."[97:B]

To the charges of undue severity and defective literature, we must add, I am afraid, the infinitely more weighty accusation of frequent immorality and buffoonery. Ludovicus Vives, who wrote just before the age of Shakspeare, asserts, that "some schoolmasters taught Ovid's books of love to their scholars, and some made expositions, and expounded the vices[97:C];" and Peacham, at the close of the era we are considering, censures in the strongest terms their too common levity and misconduct: "the diseases whereunto some of them are very subject, are _humour_ and _folly_ (that I may say nothing of the grosse ignorance and insufficiency of many) whereby they become ridiculous and contemptible both in the schoole and abroad. Hence it comes to passe, that in many places, especially in Italy, of all professions that of _pedanteria_ is held in basest repute: the schoole-master almost in every comedy being brought upon the stage, to paralell the _Zani_ or _Pantaloun_. He made us good sport in that excellent comedy of _Pedantius_, acted in our Trinity Colledge in _Cambridge_, and if I be not deceived, in _Priscianus Vapulans_, and many of our English plays.

"I knew one, who in winter would ordinarily in a cold morning, whip his boyes over for no other purpose than to get himselfe a heat: another beat them for swearing, and all the while he sweares himself with horrible oathes, he would forgive any fault saving that.

"I had I remember myselfe (neere _S. Albanes_ in _Hertfordshire_, where I was borne) a master, who by no entreaty would teach any scholler he had, farther than his father had learned before him; as, if he had onely learned but to reade English, the sonne, though he went with him seven yeeres, should goe no further: his reason was, they would then proove saucy rogues, and controule their fathers; yet these are they that oftentimes have our hopefull gentry under their charge and tuition, to bring them in science and civility."[98:A]

We must, I apprehend, from these representations, be induced to conclude, that ignorance, despotism, and self-sufficiency were leading features in the composition of the country-schoolmaster, during this period of our annals; it would not be just, however, to infer from these premises that the larger schools were equally unfortunate in their conductors; on the contrary, most of the public seminaries of the capital, and many in the large provincial towns, were under the regulation of masters highly respectable for their erudition, men, indeed, to whom neither Erasmus nor Joseph Scaliger would have refused the title of ripe and good scholars.

We shall now pass forward, in the series of our rural characters, to the delineation of one of great importance in a national point of view, that of the substantial Farmer or Yeoman, of whom Harrison has left us the following interesting definition:—"This sort of people have a certaine preheminence, and more estimation than labourers and the common sort of artificers, and these commonlie live wealthilie, kéepe good houses, and travell to get riches. They are also for the most part farmers to gentlemen, or at the leastwise artificers, and with grazing, frequenting of markets, and kéeping of servants (not idle servants, as the gentlemen doo, but such as get both their owne and part of their masters living) do come to great welth, in somuch that manie of them are able and doo buie the lands of unthriftie gentlemen, and often setting their sonnes to the schooles, to the universities, and to the Ins of the court; or otherwise leaving them sufficient lands whereupon they may live without labour, doo make them by those meanes to become gentlemen: these were they that in times past made all France afraid. And albeit they be not called master, as gentlemen are, or sir as to knights apperteineth, but onelie John and Thomas, &c.: yet have they beene found to have doone verie good service: and the kings of England in foughten battels, were woont to remaine among them (who were their footmen) as the French kings did amongst their horssemen: the prince thereby shewing where his chiefe strength did consist."[99:A]

After this description of the rank which the farmer held in society, we shall proceed to state the mode in which he commonly lived in the age of Elizabeth; and in doing this we have chosen, as usual, to adopt at considerable length the language of our old writers; a practice to which we shall in future adhere, while detailing the manners, customs, &c. of our ancestors, a practice which has indeed peculiar advantages; for the authenticity of the source is at once apparent, the diction possesses a peculiar charm from its antique cast, and the expression has a raciness and force of colouring, which owes its origin to actual inspection, and which, consequently, it is in vain to expect, on such subjects, from modern composition.

The houses or cottages of the farmer were built, in places abounding in wood, in a very strong and substantial manner, with not more than four, six, or nine inches between stud and stud; but in the open and champaine country, they were compelled to use more flimsy materials, with here and there a girding to which they fastened their splints, and then covered the whole with thick clay to keep out the wind. "Certes this rude kind of building," says Harrison, "made the Spaniards in quéene Maries daies to wonder, but chéeflie when they saw what large diet was used in manie of these so homelie cottages, in so much that one of no small reputation amongst them said after this manner: 'These English (quoth he) have their houses made of sticks and durt, but they fare commonlie so well as the king.' Whereby it appeareth that he liked better of our good fare in such coarse cabins, than of their owne thin diet in their prince-like habitations and palaces."[100:A] The cottages of the peasantry usually consisted of but two rooms on the ground-floor, the outer for the servants, the inner for the master and his family, and they were thatched with straw or sedge; while the dwelling of the substantial farmer was distributed into several rooms above and beneath, was coated with white lime or cement, and was very neatly roofed with reed; hence Tusser, speaking of the farm-house, gives the following directions for repairing and preserving its thatch in the month of May:

"Where houses be reeded (as houses have need) Now pare of the mosse, and go beat in the reed: The juster ye drive it, the smoother and plaine, More handsome ye make it, to shut off the raine."[100:B]

A few years before the era of which we are treating, the venerable Hugh Latimer, describing in one of his impressive sermons the economy of a farmer in his time, tells us that his father, who was a yeoman, had no land of his own, but only "a farm of three or four pounds by the year at the utmost; and hereupon he tilled so much as kept half a dozen men. He had a walk for an hundred sheep; and my mother milked thirty kine. He kept his son at school till he went to the university, and maintained him there; he married his daughters with five pounds or twenty nobles a piece; he kept hospitality with his neighbours, and some alms he gave to the poor; and all this he did out of the said farm."[101:A]

Land let, at this period, it should be remembered, at about a shilling per acre; but in the reign of Elizabeth its value rapidly increased, together with a proportional augmentation of the comfort of the farmer, who even began to exhibit the elegancies and luxuries of life. Of the change which took place in rural economy towards the close of the sixteenth century, the following faithful and interesting picture has been drawn by the pencil of Harrison, who, noticing the additional splendour of gentlemen's houses, remarks,—"In times past the costlie furniture staied _there_, whereas now it is descended yet lower, even unto manie farmers, who by vertue of their old and not of their new leases, have for the most part learned also to garnish their cupbords with plate, their ioined beds with tapistrie and silke hangings, and their tables with carpets and fine naperie, whereby the wealth of our countrie (God be praised therefore, and give us grace to imploie it well) dooth infinitlie appeare. Neither doo I speake this in reproch of anie man, God is my judge, but to shew that I do rejoise rather, to see how God hath blessed us with his good gifts; and whilest I behold how that in a time wherein all things are growen to most excessive prices, and what commoditie so ever is to be had, is daily plucked from the commonaltie by such as looke in to everie trade, we doo yet find the means to obtein and atchive such furniture as here to fore hath beene unpossible. There are old men yet dwelling in the village where I remaine, which have noted three things to be marvellouslie altered in England within their sound remembrance; and other three things too too much encreased. _One_ is, the multitude of chimnies latelie erected, wheras in their yoong daies there were not above two or three, if so manie in most uplandish townes of the realme, (the religious houses, and manor places of their lords alwaies excepted, and peradventure some great personages) but ech one made his fire against a rere dosse in the hall, where he dined and dressed his meat.

"The _second_ is the great (although not generall) amendment of lodging, for (said they) our fathers (yea and wee ourselves also) have lien full oft upon straw pallets, on rough mats covered onlie with a shéet, under coverlets made of dagswain or hop harlots (I use their owne termes) and a good round log under their heads instead of a bolster or pillow. If it were so that our fathers or the good man of the house, had within seven yeares after his mariage purchased a matteres or flockebed, and thereto a sacke of chaffe to rest his head upon, he thought himselfe to be as well lodged as the lord of the towne, that peradventure laie seldome in a bed of downe or whole fethers; so well were they contented, and with such base kind of furniture: which also is not verie much amended as yet in some parts of Bedfordshire, and elsewhere further off from our southerne parts. Pillowes (said they) were thought méet onelie for women in child bed. As for servants, if they had anie shéet above them it was well, for seldome had they anie under their bodies, to kéepe them from the pricking straws that ran oft through the canvas of the pallet, and rased their hardened hides.

"The _third_ thing they tell of, is the exchange of vessell, as of treene platters into pewter, and wodden spoones into silver or tin. For so common was all sorts of tréene stuff in old time, that a man should hardlie find four péeces of pewter (of which one was peradventure a salt) in a good farmer's house, and yet for all this frugalitie (if it may so be justly called) they were scarce able to live

and paie their rents at their daies without selling of a cow, or an horsse, or more, although they paid but foure pounds at the uttermost by the yeare. Such also was their povertie, that if some one od farmer or husbandman had béene at the alehouse, a thing greatlie used in those daies, amongst six or seven of his neighbours, and there in a braverie to shew what store he had, did cast downe his purse, and therein a noble or six shillings in silver unto them (for few such men then cared for gold because it was not so readie paiment, and they were oft inforced to give a penie for the exchange of an angell) it was verie likelie that all the rest could not laie downe so much against it: whereas in my time, although peradventure foure poundes of old rent be improved to fortie, fiftie, or an hundred pounds, yet will the farmer as another palme or date trée thinke his gaines verie small toward the end of his terme, if he have not six or seven yeares rent lieing by him, therewith to purchase a new lease, beside a faire garnish of pewter on his cupbord, with so much in od vessell going about the house, thrée or foure feather beds, so manie coverlids and carpets of tapistrie, a silver salt, a bowle for wine (if not an whole neast) and a dozzen of spoones to furnish up the sute."[103:A]

To this curious delineation of the furniture and household accommodation of the farmer, it will be necessary, in order to complete the sketch, to add a few things relative to his diet and hospitality. Contrary to what has taken place in modern times, the hours for meals were later with the artificer and the husbandman than with the higher order of society; the farmer and his servants usually sitting down to dinner at one o'clock, and to supper at seven, while the nobleman and gentleman took the first at eleven in the morning, and the second at five in the afternoon.

It would appear that, from the cottage to the palace, good eating was as much cultivated in the days of Elizabeth as it has been in any subsequent period; and the rites of hospitality, more especially in the country, were observed with a frequency and cordiality which a further progress in civilisation has rather tended to check, than to increase.

Of the larder of the cotter and the shepherd, and of the hospitality of the former, a pretty accurate idea may be acquired from the simple yet beautiful strains of an old pastoral bard of Elizabeth's days, who, describing a nobleman fatigued by the chase, the heat of the weather, and long fasting, adds that he—

"Did house him in a peakish graunge, Within a forrest great:

Wheare, knowne, and welcom'd, as the place And persons might afforde, Browne bread, whig, bacon, curds, and milke, Were set him on the borde:

A cushion made of lists, a stoole Half backed with a houpe, Were brought him, and he sitteth down Besides a sorry coupe.

The poor old couple wish't their bread Were wheat, their whig were perry, Their bacon beefe, their milke and curds Weare creame, to make him mery."[104:A]

The picture of the shepherd youth is so exquisitely drawn that, though only a portion of it is illustrative of our subject, we cannot avoid giving so much of the text as will render the figure complete.

"Sweet growte, or whig, his bottle had As much as it might hold:

A sheeve of bread as browne as nut, And cheese as white as snowe, And wildings, or the season's fruite, He did in scrip bestow:

And whil'st his py-bald curre did sleepe, And sheep-hooke lay him by, On hollow quilles of oten strawe He piped melody:—

— — — — — — — With the sun He doth his flocke unfold, And all the day on hill or plaine He merrie chat can hold:

And with the sun doth folde againe; Then jogging home betime, _He turnes a crab_, or tunes a round, Or sings some merrie ryme:

Nor lackes he gleeful tales to tell, Whil'st round the bole doth trot; And sitteth singing care away, Till he to bed hath got.

Theare sleeps he soundly all the night, Forgetting morrow cares, Nor feares he blasting of his corne Nor uttering of his wares,

Or stormes by seas, or stirres on land, Or cracke of credite lost, Not spending franklier than his flocke Shall still defray the cost.

Wel wot I, sooth they say that say: More quiet nightes and daies The shepheard sleepes and wakes than he Whose cattel he doth graize."[105:A]

The lines in Italics allude to the favourite beverage of the peasantry, and the mode in which they recreated themselves over the spicy bowl. To _turne a crab_ is to roast a wilding or wild apple in the fire for the purpose of being thrown hissing hot into a bowl of nut-brown ale, into which had been previously put a toast with some spice and sugar. To this delicious compound Shakspeare has

frequently referred; thus in _Love's Labour's Lost_ one of his designations of winter is,

"When roasted crabs hiss in the bowl:"[105:B]

and Puck, describing his own wanton tricks in _Midsummer Night's Dream_, says—

"And sometime lurk I in a gossip's bowl, In very likeness of a roasted crab, And when she drinks, against her lips I bob."[106:A]

The very expression to _turn a crab_ will be found in the following passages from two old plays, in the first of which the good man says he will

"Sit down in _his_ chaire by _his_ wife faire Alison, And _turne a crabbe_ in the fire;"[106:B]

and in the second, Christmas is personified

—— "sitting in a corner _turning crabs_, Or coughing o'er a warmed pot of ale."[106:C]

Nor can we omit, in closing this series of quotations, the following stanza of a fine old song in the curious comedy of _Gammer Gurton's Needle_, first printed in 1575:

"I love no rost, but a nut brown toste, and _a crab layde in the fyre_; A lytle bread shall do me stead, much bread I not desyre.

No froste nor snow, no winde, I trow, can hurte me if I wolde, I am so wrapt, and throwly lapt of joly good ale, and olde.

Back and syde go bare, go bare, booth foote and hande go colde; But belly, God sende thee good ale ynoughe, whether it be newe or olde."[106:D]

To tell gleeful tales, "whilst round the bole doth trot," was an amusement much more common among our ancestors, during the age of Elizabeth, and the subsequent century, than it has been in any later period. The _Winter's Tale_ of Shakspeare owes its title to this custom, of which an example is placed before us in the first scene of the second act.

Her. Come Sir— —— Pray you, sit by us, And tell 's a _tale_.

Mam. Merry, or sad, shal't be?

Her. As merry as you will.[107:A]

And Burton, the first edition of whose Anatomy of Melancholy was published in 1617, enumerates, among the ordinary recreations of Winter, "merry tales of errant knights, queens, lovers, lords, ladies, giants, dwarfs, thieves, cheaters, witches, fayries, goblins, friars, &c.—which some delight to hear, some to tell; all are well pleased with;" and he remarks shortly afterwards, "when three or four good companions meet, they tell old stories by the fire-side, or in the sun, as old folks usually do, remembering afresh and with pleasure antient matters, and such like accidents, which happened in their younger years."[107:B] Milton also, in his _L'Allegro_, first printed in 1645, gives a conspicuous station

—— "to the spicy nut-brown ale, With stories told of many a feat:"

and adds,

"Thus done the tales, to bed they creep, By whispering winds soon lull'd to sleep."[107:C]

The farmer's daily diet may be drawn with sufficient accuracy from the curious old Georgic of Tusser, a poem which, more than any other that we possess, throws light upon the agricultural manners and customs of the age. In Lent, says this entertaining bard, the farmer must in the first place consume his red herring, and afterwards his salt fish, which should be kept in store, indeed, and considered as good even when Lent is past, and with these leeks and peas should be procured for pottage, with the view of saving milk, oatmeal, and bread: at Easter veale and bacon are to be the chief articles; at Martilmas salted beef, "when country folk do dainties lack:" at Midsummer, when mackrel are out of season, grasse (that is sallads, &c.) fresh beef and pease: at Michaelmas fresh herring and fatted [108:A]crones: at All Saints pork and souse, sprats and spurlings: at Christmas he enjoins the farmer to "plaie and make good cheere," and he concludes by advising him, as was the custom in Elizabeth's time, to observe Fridays, Saturdays, and Wednesdays as fish-days; to "keep embrings well and fasting dayes," and of fish and fruit be scarce, to supply their want with butter and cheese.[108:B] To these recommendations he adds, in another place, that

"Good ploughmen look weekly of custom and right, For rostmeat on sundaies, and thursday at night:"

and he subsequently gives directions for writing what he terms "husbandlie posies," that is, economical proverbs in rhyme, to be hung up in the Hall, the parlour, the Ghest's chamber, and the good man's own bed chamber.[108:C]

If the farmer have a visitor, our worthy bard is not illiberal in his allowance, but advises him to place three dishes on his table at dinner, well dressed, which, says he, will be sufficient to pleese your friend, and will _become_ your Hall.[109:A]

On days of feasting and rejoicing, however, it appears to have been a common custom for the guests to bring their victuals with them, forming as it were a pic-nic meal; thus, Harrison, describing the occasional mirth and hospitality of the farmer, says,—"In feasting the husbandmen doo exceed after their maner: especiallie at bridales, purifications of women, and such od meetings, where it is incredible to tell what meat is consumed and spent, ech one bringing such a dish, or so manie with him as his wife and he doo consult upon, but alwaies with this consideration, that the léefer fréend shall have the better provision. This also is commonlie séene at these bankets, that the good man of the house is not charged with any thing saving bread, drink, sauce, houseroome, and fire. (He then gives us the following naïve and pleasing picture of their festivity and content.) The husbandmen are sufficientlie liberall, and verie fréendlie at their tables, and when they méet, they are so merie without malice, and plaine without inward Italian or French craft and subtiltie, that it would doo a man good to be in companie among them. Herein only are the inferiour sort somewhat to be blamed, that being thus assembled, their talke is now and then such as savoureth of scurrilitie and ribaldrie, a thing naturallie incident to carters and clowns, who thinke themselves not to be merie and welcome, if their foolish veines in this behalfe be never so little restreined. This is moreover to be added in these meetings, that if they happen to stumble upon a péece of venison, and a cup of wine or verie strong beere or ale (which latter they commonlie provide against their appointed daies) they thinke their chéere so great, and themselves to have fared so well, as the lord Maior of London, with whome when their bellies be full they will not often sticke to make comparison, (saying, _I have dined so well as my lord maior_) because that of a subject there is no publike officer of anie citie in Europe, that may compare in port and countenance with him during the time of his office."[109:B]

The dress of the farmer during the middle of the sixteenth century was plain and durable; consisting, for common purposes, of coarse gray cloth or fustian, in the form of trunk-hose, frock, or doublet.

To this account of the farmer's mode of living, it will be proper to add a brief description of his coadjutor in domestic economy, the English housewife, a personage of no small importance; for, as honest Tusser has justly observed,

"House keping and husbandry, if it be good, must love one another, as cousinnes in blood. The wife to, must husband as well as the man, or farewel thy husbandry, doe what thou can."[110:A]

Of the qualifications necessary to constitute this useful character, Gervase Markham has given us a very curious detail, in his work entitled "The English Housewife;" which, though not published until the close of the Shakspearian era, appears, from the dedication to Frances, Countess Dowager of Exeter, to have been written long anterior to its transmission to the press; for it is there said, "That much of it was a manuscript which many years ago belonged to an honourable Countess, one of the greatest glories of our[110:B] kingdom." It is a delineation which, as supposed of easy practical application, does honour to the sex and to the age. After expatiating on the necessity of a religious example to her household, on the part of the good housewife, he thus proceeds:

"Next unto her sanctity and holiness of life, it is meet that our _English_ Housewife be a woman of great modesty and temperance, as well inwardly as outwardly; inwardly, as in her behaviour and carriage towards her husband, wherein she shall shun all violence of rage, passion and humour, coveting less to direct than to be directed, appearing ever unto him pleasant, amiable and delightful; and, tho' occasion of mishaps, or the mis-government of his will may induce her to contrary thoughts, yet vertuously to suppress them, and with a mild sufferance rather to call him home from his error, than with the strength of anger to abate the least spark of his evil, calling into her mind, that evil and uncomely language is deformed, though uttered even to servants; but most monstrous and ugly, when it appears before the presence of a husband: outwardly, as in her apparel, and dyet, both which she shall proportion according to the competency of her husband's estate and calling, making her circle rather strait than large: for it is a rule, if we extend to the uttermost, we take away increase; if we go a hairs bredth beyond, we enter into consumption: but if we preserve any part, we build strong forts against the adversaries of fortune, provided that such preservation be honest and conscionable: for as lavish prodigality is brutish, so miserable covetousness is hellish. Let therefore the Housewife's garments be comely and strong, made as well to preserve the health, as to adorn the person, altogether without toyish garnishes, or the gloss of light colours, and as far from the vanity of new and fantastick fashions, as near to the comely imitation of modest matrons. Let her dyet be

wholesome and cleanly, prepared at due hours, and cook'd with care and diligence, let it be rather to satisfie nature, than her affections, and _apter_ to kill _hunger_ than revive _new_ appetites; let it proceed _more_ from the provision of her own yard, than the furniture of the markets; and let it be rather esteemed for the familiar acquaintance she hath without it, than for the strangeness and rarity it bringeth from other countries.

"To conclude, _our English_ Housewife must be of chast thoughts, stout courage, patient, untired, watchful, diligent, witty, pleasant, constant in friendship, full of good neighbour-hood, wise in discourse, but not frequent therein, sharp and quick of speech, but not bitter or talkative, secret in her affairs, comfortable in her counsels, and generally skilful in the worthy knowledges which do belong to her vocation."[111:A]

These knowledges, he then states, should consist in an intimacy with domestic physic, with cookery, with the distillation of waters, with the making and preserving of wines, with the making and dying of cloth, with the conduct of dairies, and with malting, brewing, and baking; for all which he gives very ample directions. Markham, indeed, seems to have taken the greater part of this picture from his predecessor Tusser, in whose poems on husbandry may be found, among many others, the following excellent precepts for the conduct of the good house-wife:—

"In Marche and in Aprill from morning to night: in sowing and setting good huswives delight. To have in their garden or some other plot: to trim up their house and to furnish their pot.

Have millons at Mihelmas, parsneps in lent: in June, buttred beanes, saveth fish to be spent. With those and good pottage inough having than: thou winnest the heart of thy laboring man.

From Aprill begin til saint Andrew be past: so long with good huswives their dairies doe last. Good milche bease and pasture, good husbandes provide: good huswives know best all the rest how to guide.

But huswives, that learne not to make their owne cheese: with trusting of others, have thes for their feese. Their milke slapt in corners their creame al to sost: their milk pannes so flotte, that their cheeses be lost.

Where some of a kowe maketh yerely a pounde: these huswives crye creake for their voice will not sounde. The servauntes suspecting their dame, lye in waighte: with one thing or other they trudge away straight.

Then neighbour (for god's sake) if any such be: if you know a good servant, waine her to me. Such maister, suche man, and such mistres such mayde: such husbandes and huswives, suche houses araide.

For flax and for hemp, for to have of her owne: the wife must in May take good hede it be sowne. And trimme it and kepe it to serve at a nede: the femble to spin and the karle for her fede.

Good husbandes abrode seketh al wel to have: good huswives at home seketh al wel to save. Thus having and saving in place where they meete: make profit with pleasure suche couples to greete.[113:A]"

But it is in "The points of _Huswifry_ united to the comfort of _Husbandry_," of the good old poet, that we recognise the most perfect picture of the domestic economy of agricultural life in the days of Elizabeth. This material addition to the husbandry of our author appeared in 1570, and embraces a complete view of the province of the _Huswife_, with all her daily labours and duties, which are divided into—1st, _Morning Works_; 2dly, _Breakfast Doings_; 3dly, _Dinner Matters_; 4thly, _Afternoon Works_; 5thly, _Evening Works_; 6thly, _Supper-Matters_; and 7thly, _After-Supper Matters_.

From the details of this arrangement we learn, that the servants in summer rose at four, and in winter at five o'clock; that in the latter season they were called to breakfast on the appearance of the day-star, and that the huswife herself was the carver and distributer of the meat and pottage. We find, likewise, and it is the only objectionable article in the admonitions of the poet, that he recommends his dame not to scold, but to thrash heartily her maids when refractory; and he adds a circumstance rather extraordinary, but at the same time strongly recommendatory of the effects of music, that

"Such servants are oftenest painfull and good, That sing in their labour, as birds in the wood."

Dinner, he enjoins, should be taken at noon; should be quickly dispatched; and should exhibit plenty, but no dainties.

The bare table, he observes, will do as well, as if covered with a cloth, which is liable to be cut; and that wooden and pewter dishes and tin vessels for liquor are the best, as most secure; and then, with his accustomed piety, he advises the regular use of grace—

"At dinner, at supper, at morning, at night, Give thanks unto God."

As soon as dinner is over, the servants are again set to work, and he very humanely adds,

"To servant in seikness, see nothing ye grutch, A thing of a trifle shall comfort him much."

Many precepts, strictly economical, then follow, in which the huswife is directed to save her parings, drippings, and skimmings for the sake of her poultry, and for "medicine for cattle, for cart, and for shoe;" to employ the afternoon, like a good sempstress, in making and mending; to keep her maids cleanly in their persons, to call them quarterly to account, to mark and number accurately her linen, to save her feathers, to use little spice, and to make her own candle.

The business of the evening commences with preparations for supper, as soon as the hens go to roost; the hogs are then to be served, the cows milked, and as night comes on, the servants return, but none empty-handed, some bringing in wood, some logs, &c. The cattle, both without and within doors, are next to be attended to, all clothes brought into the house, and no door left unbolted, and the duties of the evening close with this injunction:

"Thou woman, whom pity becometh the best, Grant all that hath laboured time to take rest."

Supper now is spread, and the scene opens with an excellent persuasive to cheerfulness and hospitality:

"Provide for thy husband, to make him good cheer, Make merry together, while time ye be here. A-bed and at board, howsoever befall, Whatever God sendeth, be merry withall. No taunts before servants, for hindering of fame, No jarring too loud, for avoiding of shame."

The servants are then ordered to be courteous, and attentive to each other, especially at their meals, and directions are given for the next morning's work.

The last section, entitled "After-supper matters," is introduced and terminated in a very moral and impressive manner. The first couplet tells us to

"Remember those children, whose parents be poor, Which hunger, yet dare not to crave at thy door;"

the bandog is then ordered to have the bones and the scraps; the huswife looks carefully to the fire, the candle, and the keys; the whole family retire to rest, at nine in winter, and at ten in summer, and the farmer's day closes with four lines which ought to be written in letters of gold, and which, if duly observed, would ensure a great portion of the happiness obtainable by man:

"Be lowly, not sullen, if aught go amiss, What wresting may lose thee, that win with a kiss. Both bear and forbear, now and then as ye may, Then wench, God a mercy! thy husband will say."[115:A]

Frugality and domestic economy were not, however, the constant attributes of the farmer's wife in the age of which we are treating; the luxury of dress, both in England and Scotland, had already corrupted the simplicity of country-habits. Stephen Perlet, who visited Scotland in 1553, and Fines Moryson, who made a similar tour in 1598[118:A], agree in describing the dress of the common people of both countries as nearly if not altogether the same; the picture, therefore, which Dunbar has given us of the dress of a rich farmer's wife, in Scotland, during the middle of the sixteenth century, will apply, with little fear of exaggeration, to the still wealthier dames of England. He has drawn her in a robe of fine scarlet with a white hood; a gay purse and gingling keys pendant at her side from a silken belt of silver tissue; on each finger she wore two rings, and round her waste was bound a sash of grass-green silk, richly embroidered with silver.[118:B] To this rural extravagancy in dress, Warner will bear an equal testimony; for, describing two old gossips cowering over their cottage-fire, and chatting how the world was changed in their time,

"When we were maids (quoth one of them) Was no such new found pride: Then wore they shooes of ease, now of An inch-broad, corked hye: Black karsie stockings, worsted now, Yea silke of youthful'st dye:

Garters of lystes, but now of silke, Some edged deep with gold: With costlier toyes, for courser turns, Than us'd, perhaps of old.

Fring'd and ymbroidered petticoats Now begge. But heard you nam'd, Till now of late, busks, perrewigs, Maskes, plumes of feathers fram'd,

Supporters, posters, fardingales Above the loynes to waire, That be she near so bombe-thin, yet She crosse-like seems foure-squaire?

Some wives, grayheaded, shame not locks Of youthfull borrowed haire: Some, tyring arte, attyer their heads With only tresses bare:

Some, (grosser pride than which, think I, No passed age might shame) By arte, abusing nature, heads Of antick't hayre doe frame.

Once starching lack't the tearme, because Was lacking once the toy, And lack't we all these toyes and tearmes, It were no griefe but joy.—

Now dwels ech drossell in her glas: When I was yong, I wot, On holly-dayes (for sildome els Such ydell times we got) A tubb or paile of water cleere Stood us in steede of glas."[119:A]

Luxury and extravagance soon spread beyond the female circle, and the _Farmer's Heir_ of forty pounds a year, is described by Hall, in 1598, as dissipating his property on the follies and fopperies of the day.

"Vilius, the wealthy farmer, left his heire Twice twenty sterling pounds to spend by yeare:— But whiles ten pound goes to his wife's new gowne, Nor little lesse can serve to suit his owne; Whiles one piece pays her idle waiting-man, Or buys an hoode, or silver-handled fanne, Or hires a Friezeland trotter, halfe yard deepe, To drag his tumbrell through the staring Cheape; Or whiles he rideth with two liveries, And's treble rated at the subsidies; One end a kennel keeps of thriftlesse hounds; What think ye rests of all my younker's pounds To diet him, or deal out at his doore, To coffer up, or stocke his wasting store?"[119:B]

In contrast to this character, who keeps a pack of hounds, and sports a couple of liveries, it will be interesting to bring forward the picture of the _poor copyholder_, as drawn by the same masterly pencil; the description of the wretched hovel is given in all the strength of minute reality, and the avidity of the avaricious landlord is wrought up with several strokes of humour.

"Of one bay's breadth, God wot, a silly cote, Whose thatched spars are furr'd with sluttish soote A whole inch thick, shining like black-moor's brows, Through smoke that downe the headlesse barrel blows. At his bed's feete feeden his stalled teame, His swine beneath, his pullen o'er the beame. A starved tenement, such as I guesse Stands straggling on the wastes of Holdernesse: Or such as shivers on a Peake hill side, &c.— Yet must he haunt his greedy landlord's hall With often presents at each festivall: With crammed capons everie new-yeare's morne, Or with greene cheese when his sheepe are shorne: Or many maunds-full of his mellow fruite, To make some way to win his weighty suite.— The smiling landlord shews a sunshine face, Feigning that he will grant him further grace; And leers like Esop's foxe upon the crane, Whose neck he craves for his chirurgian."[120:A]

We shall close these characters, illustrative of rural manners, as they existed in the reigns of Elizabeth and James 1st, with a delineation of the _plain Country Fellow or down right Clown_, from the accurate pen of Bishop Earle, who has touched this homely subject with singular point and spirits.

"A _plain country fellow_ is one that manures his ground well, but lets himself lye fallow and untilled. He has reason enough to do his business, and not enough to be idle or melancholy. He seems to have the punishment of _Nebuchadnezzar_, for his conversation is among beasts, and his tallons none of the shortest, only he eats not grass, because he loves not sallets. His hand guides the plough, and the plough his thoughts, and his ditch and land-mark is the very mound of his meditations. He expostulates with his oxen very understandingly, and speaks gee, and ree, better than English. His mind is not much distracted with objects, but if a good fat cow come in his way, he stands dumb and astonished, and though his haste be never so great, will fix here half an hour's contemplation. His habitation is some poor thatched roof, distinguished from his barn by the loop-holes that let out smoak, which the rain had long since washed through, but for the double ceiling of bacon on the inside, which has hung there from his grandsire's time, and is yet to make rashers for posterity. His dinner is his other work, for he sweats at it as much as at his labour; he is a terrible fastner on a piece of beef, and you may hope to stave the guard off sooner. His religion is a part of his copy-hold, which he takes from his land-lord, and refers it wholly to his discretion: yet if he give him leave he is a good Christian to his power, (that is,) comes to church in his best cloaths, and sits there with his neighbours, where he is capable only of two prayers, for rain, and fair weather. He apprehends God's blessings only in a good year, or a fat pasture, and never praises him but on _good ground_. Sunday, he esteems a day to make merry in, and thinks a bag-pipe as essential to it as evening prayer, where he walks very solemnly after service with his hands coupled behind him, and censures the dancing of his parish. His compliment with his neighbour is a good thump on the back, and his salutation commonly some blunt curse. He thinks nothing to be vices, but pride and ill husbandry, from which he will gravely dissuade the youth, and has some thrifty hob-nail proverbs to clout his discourse. He is a niggard all the week, except only market-day, where, if his corn sell well, he thinks he may be drunk with a good conscience. He is sensible of no calamity but the burning a stack of corn or the overflowing of a meadow, and thinks Noah's flood the greatest plague

that ever was, not because it drowned the world, but spoiled the grass. For death he is never troubled, and if he get in but his harvest before, let it come when it will, he cares not."[122:A]

The _nine_ characters which have now passed in brief review before us, namely, the _Rural Squire_; the _Rural Coxcomb_; the _Rural Clergyman_; the _Rural Pedagogue_; the _Farmer_ or _substantial Yeoman_; the _Farmer's Wife_; the _Farmer's Heir_; the _Poor Copyholder_, and the mere _Ploughman_ or _Country Boor_, will, to a certain extent, point out the personal manners, condition, and mode of living of those who inhabited the country, during the period in which Shakspeare flourished. They have been given from the experience, and, generally, in the very words of contemporary writers, and may, therefore, be considered as faithful portraits. To complete the picture, a further elucidation of the customs of the country, as drawn from its principal occurrences and events, will be the subject of the ensuing chapter, in which the references to the works of our immortal bard will be more frequent than could take place while collecting mere out-line draughts of rural character.

FOOTNOTES:

[68:A] Holinshed's Chronicles, edit. of 1807, in six vols. 4to. vol. i. p. 276.

[68:B] Holinshed, vol. i. p. 273.

[69:A] Taming of the Shrew, act ii. sc. 1.

[70:A] Of the very rare tract from which these extracts are taken, the following is the entire title-page:—"The Gentleman's Academie; or, the Booke of St. Albans: containing three most exact and excellent Bookes: the first of Hawking, the second of all the proper Termes of Hunting, and the last of Armorie: all compiled by Juliana Barnes, in the Yere from the Incarnation of Christ 1486. And now reduced into a better method, by G. M. London. Printed for Humphrey Lownes, and are to be sold at his shop in Paules Church-yard, 1595." This curious edition of the _Booke of St. Albans_, accommodated to the days of Shakspeare, contains 95 leaves 4to. and I shall add the interesting dedication:

"To the Gentlemen of England: and all good fellowship of Huntsmen and Falconers.

"Gentlemen, this booke, intreting of Hawking, Hunting, and Armorie; the originall copie of the which was doone at St. Albans, about what time the excellent arte of printing was first brought out of Germany, and practised here in England: which booke, because of the antiquitie of the same, and the things therein contained, being so necessarie and behovefull to the accomplishment of the gentlemen of this flourishing ile, and others which take delight in either of these noble sports, or in that heroicall and excellent study of Armory, I have revived and brought again to light the same which was almost altogether forgotten, and either few or none of the perfect copies thereof remaining, except in their hands, who wel knowing the excellency of the worke, and the rarenesse of the booke, smothered the same from the world, thereby to inrich themselves in private with the knowledge of these delights. Therfore I humbly crave pardon of the precise and judicial reader, if sometimes I use the words of the ancient authour, in such plaine and homely English, as that time affoorded, not being so regardful, nor tying myself so strictly to deliver any thing in the proper and peculiar wordes and termes of arte, which for the love I beare to antiquitie, and to the honest simplicitie of those former times, I observe as wel beseeming the subject, and no whit disgracefull to the worke, our tong being not of such puritie then, as at this day the poets of our age have raised it to: of whom, and in whose behalf I wil say thus much, that our nation may only thinke herself beholding for the glory and exact compendiousnes of our longuage. Thus submitting our academy to your kind censures and friendly acceptance of the same, and requesting you to reade with indifferency, and correct with judgement; I commit you to God.

G. M."

From this dedication we learn that the original edition of the Booke of St. Albans was as scarce towards the close of the sixteenth century as at the present day; that "few or none of the perfect copies" were to be obtained; for that those were in the hands of _Bibliomaniacs_ who (like too many now existing) "smother'd them from the world." We have, therefore, every reason to conclude, from "the rarenesse (and consequent value) of the booke" of 1486, that the copy of Juliana's work in the library of Shakspeare, was the edition by Markham of 1595. I shall just add, that the copy now before me, was purchased at the Roxburgh sale, for 9_l._ 19_s._ 6_d._! It is, notwithstanding, probable, from the _peculiarities_ attending Markham's re-impression, that this sum, great as it may appear, will be exceeded at some future sale.

The attachment of _Gervase Markham_ to the subjects which employed the pen of his favourite Prioress, is very happily introduced by Mr. Dibdin, while alluding to the similar propensities of the _modern Markham_, Mr. Haslewood. "Up starts FLORIZEL, and

blows his bugle, at the annunciation of any work, new or old, upon the diversions of _Hawking_, _Hunting_, or _Fishing_! Carry him through CAMILLO'S cabinet of Dutch pictures, and you will see how instinctively, as it were, his eyes are fixed upon a sporting piece by Wouvermans. The hooded hawk, in his estimation, hath more charms than Guido's Madonna:—how he envies every rider upon his white horse!—how he burns to bestride the foremost steed, and to mingle in the fair throng, who turn their blue eyes to the scarcely bluer expanse of heaven! Here he recognises _Gervase Markham_, spurring his courser; and there he fancies himself lifting _Dame Juliana_ from her horse! Happy deception! dear fiction! says Florizel—while he throws his eyes in an opposite direction, and views every printed book upon the subject, from _Barnes_ to _Thornton_." Bibliomania, p. 729, 730.

The following very amusing description of "the difference twixt Churles and Gentlemen," will prove an adequate specimen of Markham's edition, will be appropriate to the subject in the text, and may be compared with the accurate reprint of the edition of W. De Worde by Mr. Haslewood.

"There was never gentleman, nor churle ordained, but hee had father and mother: Adam and Eve had neither father nor mother, and therefore in the sonnes of Adam and Eve, first issued out both gentleman and churle. By the sonnes of Adam and Eve, to wit, Seth, Abell, and Caine, was the royall blood divided from the rude and barbarous, a brother to murder his brother contrary to the law, what could be more ungentlemanly or vile? in that, therefore, became Caine and al his ofspring churles, both by the curse of God, and his owne father. Seth was made a gentleman through his father and mother's blessing, from whose loynes issued Noah, a gentleman by kind and linage. Noah had three sonnes truely begotten, two by the mother, named Cham and Sem, and the third by the father called Japhet, even in these three, after the world's inundation, was both gentlenes and vilenes discerned, in Cham was grose barbarisme founde towardes his owne father in discovering his privities, and deriding from whence hee proceeded. Japhet the yongest gentlemanlike reproved his brother, which was to him reputed a vertue, where Cham for his abortive vilenes became a churle both through the curse of God and his father Noah. When Noah awoke, hee said to Cham his sonne knowest not thou how it is become of Caine the sonne of Adam, and of his churlelike blood, that for them all the worlde is drowned save eight persons, and wilt thou nowe begin barbarisme againe, whereby the world in after ages shall be brought to consummation? well upon thee it shall bee and so I pray the Great one it maye fall out, for to thee I give my curse, and withall the north part of the world, to draw thine habitation unto, for there shall it be where sorrow, care, colde, and as a mischievous and unrespected churle thou shall live, which part of the earth shall be termed Europe, which is the country of churles. Japhet come hither my sonne, on thee will I raine my blessing, deare insteede of Seth: Adams sonne, I make thee a gentleman, and thy renowne shall stretch through the west part of the world, and to the end of the Occident, where wealth and grace shall flourish, there shall be thine habitation, and thy dominion shall bee called Asia, which is the cuntrie of gentlemen. And Sem my sonne, I make thee a gentleman also, to multiply the blood of Abell slaine so undeservedlie, to thee I give the orient, that part of the world which shal be called Africa, which is the country of temperateres: and thus divided Noah the world and his blessings. From the of-spring of gentlemanly Japhet came Abraham, Moyses, Aaron and the Prophets, and also the king of the right line of Mary, of whom that only absolute gentleman Jesus was borne, perfite God and perfite man, according to his manhood king of the lande of Juda and the Jewes, and gentleman by his mother Mary princesse of coat armor." Fol. 44.

[80:A] City Madam, act ii. sc. 1.

Gervase Markham in his English House-Wife, the first edition of which was published not long after Shakspeare's death, after mentioning in his second chapter, which treats of cookery, the manner of "ordering great feasts," closes his observations under this head, with directions for "a more humble feast, or an ordinary proportion which any good man may keep in his family, for the entertainment of his true and worthy friend;" this _humble feast_ or _ordinary proportion_, he proceeds to say, should consist for the first course of "sixteen full dishes, that is, dishes of meat that are of substance, and not empty, or for shew—as thus, for example; first, a shield of brawn with mustard; secondly, a boyl'd capon; thirdly, a boyl'd piece of beef; fourthly, a chine of beef rosted; fifthly, a neat's tongue rosted; sixthly, a pig rosted; seventhly, chewets bak'd; eighthly, a goose rosted; ninthly, a swan rosted; tenthly, a turkey rosted; the eleventh, a haunch of venison rosted; the twelfth, a pasty of venison; the thirteenth, a kid with a pudding in the belly; the fourteenth, an olive-pye; the fifteenth, a couple of capons; the sixteenth, a custard or dowsets. Now to these full dishes may be added sallets, fricases, quelque choses, and devised paste, as many dishes more which make the full service no less than two and thirty dishes, which is as much as can conveniently stand on one table, and in one mess; and after this manner you may proportion both your second and third course, holding fulness on one half of the dishes, and shew in the other, which will be both frugal in the spendor, contentment to the guest, and much pleasure and delight to the beholders." [86:A] Lodge's Illustrations of British History, Biography, and Manners, in the Reigns of Henry VIII., Edward VI., Mary, Elizabeth, and James I., vol. ii. p. 383.

That this evil kept gradually increasing during the reign of James I., may be proved from the testimony of Peacham and Brathwait; the former, in his _Compleat Gentleman_, observes,—"Much doe I detest that effeminacy of the most, that burne out day and night in their beds, and by the fire side; in trifles, gaming, or courting their yellow mistresses all the winter in a city; appearing but as cuckoes in the spring, one time in the yeare to the countrey and their tenants, leaving the care of keeping good houses at

Christmas, to the honest yeomen of the countrey;" (p. 214.) and the latter, in his _English Gentleman_, addressing the rural fashionables of his day, exclaims,—"Let your countrey (I say) enjoy you, who bred you, shewing there your hospitality, where God hath placed you, and with sufficient meanes blessed you. I doe not approve of these, who fly from their countrey, as if they were ashamed of her, or had committed something unworthy of her. How blame-worthy then are these _Court-comets_, whose onely delight is to admire themselves? These, no sooner have their bed-rid _fathers_ betaken themselves to their last home, and removed from their crazie couch, but they are ready to sell a mannor for a coach. They will not take it as their fathers tooke it: their countrey houses must bee barred up, lest the poore passenger should expect what is impossible to finde, releefe to his want, or a supply to his necessity. No, the cage is opened, and all the birds are fled, not one crum of comfort remaining to succour a distressed poore one. Hospitality, which was once a _relique_ of _gentry_, and a knowne _cognizance_ to all ancient houses, hath lost her title, meerely through discontinuance: and _great houses_, which were at first founded to releeve the poore, and such needfull passengers as travelled by them, are now of no use but onely as _waymarkes_ to direct them. But whither are these _Great ones_ gone? To the _Court_; there to spend in boundlesse and immoderate riot, what their provident ancestors had so long preserved, and at whose doores so many needy soules have beene comfortably releeved." Second edition, 1633. p. 332.

In the margin of the page from which this extract is taken, occurs the following note:—"This is excellently seconded by a Princely pen, in a pithy poem directed to all persons to ranke or quality to leave the Court, and returne into their owne countrey."

[86:B] In confirmation of this remark, I shall beg leave to give, for the entertainment of my readers, the two following sketches of country-squires, as they existed towards the middle of the seventeenth, and commencement of the eighteenth century. "Mr. Hastings," relates Gilpin from Hutchin's History of Dorsetshire, "was low of stature, but strong and active, of a ruddy complexion with flaxen hair. His cloaths were always of green cloth, his house was of the old fashion; in the midst of a large park, well stocked with deer, rabbits, and fish-ponds. He had a long narrow bowling green in it; and used to play with round sand bowls. Here too he had a banquetting room built, like a stand, in a large tree. He kept all sorts of hounds, that ran buck, fox, hare, otter, and badger: and had hawks of all kinds, both long and short winged. His great hall was commonly strewed with marrow bones; and full of hawk-perches, hounds, spaniels, and terriers. The upper end of it was hung with fox-skins, of this and the last year's killing. Here and there a pole-cat was intermixed; and hunter's poles in great abundance. The parlour was a large room, compleatly furnished in the same style. On a broad hearth, paved with brick, lay some of the choicest terriers, hounds and spaniels. One or two of the great chairs had litters of cats in them, which were not to be disturbed. Of these, three or four always attended him at dinner, and a little white wand lay by his trencher, to defend it, if they were too troublesome. In the windows which were very large, lay his arrows, cross-bows, and other accoutrements. The corners of the room were filled with his best hunting and hawking poles. His oyster table stood at the lower end of the room, which was in constant use twice a day, all the year round; for he never failed to eat oysters both at dinner and supper; with which the neighbouring town of Pool supplied him. At the upper end of the room stood a small table with a double desk; one side of which held a CHURCH BIBLE; the other the BOOK OF MARTYRS. On different tables in the room lay hawk's-hoods, bells, old hats, with their crowns thrust in, full of pheasant eggs; tables, dice, cards, and store of tobacco pipes. At one end of this room was a door, which opened into a closet, where stood bottles of strong beer and wine; which never came out but in single glasses, which was the rule of the house; for he never exceeded himself nor permitted others to exceed. Answering to this closet, was a door into an old chapel; which had been long disused for devotion; but in the pulpit, as the safest place, was always to be found a cold chine of beef, a venison pasty, a gammon of bacon, or a great apple-pye, with thick crust well baked. His table cost him not much, though it was good to eat at. His sports supplied all, but beef and mutton; except on Fridays, when he had the best of fish. He never wanted a London pudding; and he always sang it in with "_My part lies therein-a_." He drank a glass or two of wine at meals; put syrup of gilly-flowers into his sack; and had always a tun glass of small beer standing by him, which he often stirred about with rosemary. He lived to be an hundred; and never lost his eye sight, nor used spectacles. He got on horseback without help; and rode to the death of the stag, till he was past four score." Gilpin's Forest Scenery; vol. ii. p. 23. 26.

Mr. Dibdin, in the second edition of his Bibliomania, the most pleasing and interesting book which Bibliography has ever produced, has quoted the above passage, and thus alludes, in his text, to the character which it describes:—"But what shall we say to Lord Shaftesbury's eccentric neighbour, HENRY HASTINGS? who, in spite of his hawks, hounds, kittens, and oysters, could not forbear to indulge his book-propensities, though in a moderate degree! Let us fancy we see him, in his eightieth year, just alighted from the toils of the chase, and listening, after dinner, with his 'single glass' of ale by his side, to some old woman with 'spectacle on nose,' who reads to him a choice passage out of John Fox's _Book of Martyrs_! A rare old boy was this Hastings." Bibliomania, p. 379.

Mr. Grose, the antiquary, has given us, in his sketches of some worn-out characters of the last age, a most amusing portrait of the country squire of Queen Anne's days: "I mean," says he, "the little independant gentleman of three hundred pounds per annum,

who commonly appeared in a plain drab or plush coat, large silver buttons, a jockey cap, and rarely without boots. His travels never exceeded the distance of the county town, and that only at assize and session time, or to attend an election. Once a week he commonly dined at the next market town, with the attornies and justices. This man went to church regularly, read the Weekly Journal, settled the parochial disputes between the parish officers at the vestry, and afterwards adjourned to the neighbouring ale-house, where he usually got drunk for the good of his country. He never played at cards but at Christmas, when a family pack was produced from the mantle-piece. He was commonly followed by a couple of grey-hounds and a pointer, and announced his arrival at a neighbours house by smacking his whip, or giving the view-halloo. His drink was generally ale, except on Christmas, the fifth of November, or some other gala days, when he would make a bowl of strong brandy punch garnished with a toast and nutmeg. A journey to London was, by one of these men, reckoned as great an undertaking, as is at present a voyage to the East Indies, and undertaken with scarce less precaution and preparation.

"The mansion of one of these 'Squires was of plaister striped with timber, not unaptly called callimanco work, or of red brick, large casemented bow windows, a porch with seats in it, and over it a study; the eaves of the house well inhabited by swallows, and the court set round with holly-hocks. Near the gate a horse-block for the conveniency of mounting.

"The hall was furnished with flitches of bacon, and the mantle-piece with guns and fishing rods of different dimensions, accompanied by the broad sword, partizan, and dagger, borne by his ancestor in the civil wars. The vacant spaces were occupied by stag's horns. Against the wall was posted King Charles's Golden Rules, Vincent Wing's Almanack, and a portrait of the Duke of Marlborough; in his window lay Baker's Chronicle, Fox's Book of Martyrs, Glanvil on Apparitions, Quincey's Dispensatory, the Complete Justice, and a Book of Farriery.

"In the corner, by the fire side, stood a large wooden two-armed chair with a cushion; and within the chimney corner were a couple of seats. Here, at Christmas, he entertained his tenants assembled round a glowing fire made of the roots of trees, and other great logs, and told and heard the traditionary tales of the village respecting ghosts and witches, till fear made them afraid to move. In the mean time the jorum of ale was in continual circulation.

"The best parlour, which was never opened but on particular occasions, was furnished with Turk-worked chain, and hung round with portraits of his ancestors; the men in the character of shepherds, with their crooks, dressed in full suits and huge full-bottomed perukes: others in complete armour or buff coats, playing on the base viol or lute. The females likewise as shepherdesses, with the lamb and crook, all habited in high heads and flowing robes.

"Alas! these men and these houses are no more!" _Grose's Olio_, 2nd edit. 1796. p. 41-44.

Even this, and every other description of the duties of the Huswife, may be traced to "The Book of Husbandry," written by Sir Anthony Fitzherbert, of Norbury, in Derbyshire.

This gentleman, who was a Judge of the Common Pleas, in the reign of Henry the Eighth, is justly entitled to the appellation of "the father of English Husbandry." His work, the first edition of which was printed by Richard Pynson, in 1528, 4to., underwent not less than eleven editions during the sixteenth century, and soon excited among his countrymen a most beneficial spirit of emulation. Notwithstanding these numerous impressions, there are probably not ten complete copies left in the kingdom.

One of these is, however, now before me included in a thick duodecimo, of which the _first article_ is "Xenophon's treatise of householde," black letter, title wanting; the colophon, "Imprinted At London in fletestrete in the house of Thomas Berthelet. Cum privilegio ad imprimendum solum." No date. The _second article_ is "The booke of Husbandrye verye profitable and necessary for all maner of persons, newlye corrected and amended by the auctor fitzherbard, with dyvers addicions put thereunto. Anno do. 1555," black letter. Colophon, "Imprinted at London in Flete strete at the signe of the Sunne over agaynst the Conduit by John Weylande." Sixty-one leaves, exclusive of the table. The _third article_ is entitled "Surveyinge," An. 1546. Colophon, "Londini in ædibus Thome Berthelet typis impress. Cum privilegio ad imprimendum solum." Contains sixty leaves, black letter.

From "The booke of husbandrye," I shall extract the detail of huswifely duties, as a specimen of the work, and as a proof of the assertion at the commencement of this note.

"What workes a wyfe shoulde doe in generall.

"First in the mornyng when thou art wak■d and purpose to rise, lift up thy hand, and blis the and make a signe of the holy crosse. In nomine patris et filii et spiritus sancti. Amen. In the name of the father y{e} sonne, and the holy gost. And if thou saye a Paternoster, an Ave and a Crede, and remembre thy maker thou shalte spede much the better, and when thou art up and readye, then firste swepe thy house; dresse up the dysshe bord, and set al thynges in good order within thy house, milke y{e} kie, socle thy calves, sile by thy milke, take up thy children, and aray them, and provide for thy husbande's breakefaste, diner, souper, and for thy children and servauntes, and take thy parte wyth them. And to ordeyne corne and malt to the myll, to bake and brue withal when nede is. And mete it to the myl and fro the myl, and se that thou have thy mesure agayne besides the tole or elles the mylner dealeth not truly wyth the, or els thy corne is not drye as it should be, thou must make butter and chese when thou may, serve thy swine both mornynge and eveninge, and give thy polen meate in the mornynge, and when tyme of yeare cometh thou must take hede how thy henne, duckes and geese do ley, and to gather up their egges and when they waxe broudy to set them there as no beastes, swyne, nor other vermyne hurt them, and thou must know that al hole foted foule wil syt a moneth and all cloven foted foule wyll syt but three wekes except a peyhen and suche other great foules as craynes, bustardes, and suche other. And when they have brought forth theyr birdes to se that they be well kepte from the gleyd, crowes fully martes and other vermyn, and in the begynyng of March, or a lytle before is time for a wife to make her garden and to get as manye good sedes and herbes as she can, and specyally such as be good for the pot and for to eate and as ofte as nede shall require it must be weded, for els the wede wyll over grow the herbes, and also in Marche is time to sowe flaxe and hempe for I have heard olde huswyves say, that better is Marche hurdes than Apryll flaxe, the reason appereth, but howe it shoulde bee sowen, weded, pulled, repealed, watred, washen, dried, beten, braked, tawed, hecheled, spon, wounden, wrapped and oven, it nedeth not for me to shewe, for they be wyse ynough, and thereof may they make shetes, bordclothes, towels, shertes, smockes, and suche other necessaryes, and therefore lette thy dystaffe be alwaye redy for a pastyme, that thou be not ydell. And undoubted a woman can not get her livinge honestly with spinning on the dystaffe, but it stoppeth a gap and must nedes be had. The bolles of flaxe when they be rypled of, must be rediled from the wedes and made dry with the sunne to get out the sedes. Now be it one maner of linsede called loken sede wyll not open by the sunne, and therefore when they be drye they must be sore brusen and broken the wyves know how, and then wynowed and kept dry til peretime cum againe. Thy femell hempe must be pulled fro the chucle hempe for this beareth no sede and thou must doe by it as thou didest by the flaxe. The chucle hempe doth beare sede, and thou must be ware that birdes eate it not as it groweth, the hempe thereof is not so good as the femel hempe, but yet it wil do good service. It may fortune sometime that thou shalte have so many thinges to do that thou shalte not wel know where is best to begyn. Then take hede which thing should be the greatest losse if it were not done and in what space it woulde be done, and then thinke what is the greatest los and ther begin. But I put case that, that thing that is of the greatest losse wyll be longe in doing, that thou might do thre or iiij other thinges in the meane whyle then loke wel if all these thinges were set togyther whiche of them were greatest losse, and yf these thynges be of greater losse, and may be al done in as shorte space as the other, then do thy many thinges fyrst. It is convenient for a husbande to have

shepe of his owne for many causes, and then may his wife have part of the wooll to make her husbande and her selfe sum clothes. And at the least waye she may have the lockes of the shepe therwith to make clothes or blankets, and coverlets, or both. And if she have no wol of her owne she maye take woll to spynne of cloth makers, and by that meanes she may have a convenient living, and many tymes to do other workes. It is a wives occupacion to winow al maner of cornes, to make malte wash and wring, to make hey, to shere corne, and in time of nede to helpe her husbande to fyll the mucke wayne or donge carte, dryve the plough, to lode hey corne and such other. Also to go or ride to the market to sell butter, chese, mylke, egges, chekens, kapons, hennes, pygges, gees, and al maner of corne. And also to bye al maner of necessary thinges belonging to a houshold, and to make a true rekening and accompt to her husband what she hath receyved and what she hathe payed. And yf the husband go to the market to bye or sell as they ofte do, he then to shew his wife in lyke maner. For if one of them should use to disceive the other, he disceyveth himselfe, and he is not lyke to thryve, and therfore they must be true ether to other. I could peraventure shew the husbande of divers pointes that the wives disceve their husbandes in, and in like maner how husbandes deceve their wives. But yf I should do so, I shuld shew mo subtil pointes of disceite then other of them knew of before. And therfore me semeth best to holde my peace, leste I shuld do as the knight of the tower did the which had many faire doghters, and of fatherlie love that he oughte to them he made a boke unto a good intent that they mighte eschewe and flee from vices and folowe vertues in the which boke he sheweth that yf they were woed, moved, or styrred by any man after such a maner as is there shewed that they shuld withstande it, in the which booke he shewed so manye wayes how a man shuld attaine to his purpose to bryng a woman to vice, the which waies were so naturall and the wayes to come to theyr purpose was so subtylly contrived and craftely shewed that hard it wolde be for any woman to resist or deny their desyre. And by the sayd boke hath made both the man and the woman to know mo vyces subtylty and crafte then ever they shoulde have knowen if the boke had not bene made, the which boke he named him selfe the knighte of the tower. And thus I leave the wyves to use theyr occupations at theyr owne discression." Fol. 45, 46, 47.

CHAPTER VI.

A VIEW OF _COUNTRY LIFE_ DURING THE AGE OF SHAKSPEARE; ITS MANNERS AND CUSTOMS.—RURAL HOLYDAYS, AND FESTIVALS.

The record of rural festivity and amusement, must, as far as it is unaccompanied by any detail of riot or intemperance, be a subject of pleasing contemplation to every good and cheerful mind. Labour, the destined portion of by far the greater part of human beings, requires frequent intervals of relaxation; and the encouragement of innocent diversion at stated periods, may be considered, therefore, both in a moral and political point of view, as essentially useful. The sports and amusements of our ancestors on their holydays and festivals, while they had little tendency to promote either luxury or dissipation, contributed very powerfully to preserve some of the best and most striking features of our national manners and character, and were frequently mingled with that cheerful piety which forms the most heart-felt species of devotion, where religion, mixing with the social rite, offers up the homage of a happy and contented heart.

It may be necessary here to mention, that in enumerating the various ceremonial and feast days of rural life, we have purposely omitted those which are _peculiarly_ occupied by _superstitious_ observances, as they will with more propriety be included under a subsequent chapter, appropriated to the consideration of popular superstitions.

The ushering in of the New Year, or _New Years tide_, with rejoicings, presents, and good wishes, was a custom observed, during the sixteenth century, with great regularity and parade, and was as cordially celebrated in the court of the prince as in the cottage of the peasant.

To end the old year _merrily_ and begin the new one _well_, and in _friendship_ with their neighbours, were the objects which the common people had in view in the celebration of this tide or festival. New-Years Eve, therefore, was spent in festivity and frolic by the men; and the young women of the village carried about, from door to door, a bowl of spiced ale, which they offered to the inhabitants of every house where they stopped, singing at the same time some rude congratulatory verses, and expecting some small present in return. This practice, however, which originated in pure kindness and benevolence, soon degenerated into a mere pecuniary traffic, for Selden, in his Table Talk, thus alludes to the subject, while drawing the following curious comparison: "The pope in sending relicks to princes, does as _wenches_ do by their _wassails_ at _New Years Tide_.—They _present you_ with a _cup_, and you must _drink_ of a slabby stuff; but the meaning is, you must _give_ them _money_ ten times more than it is worth."[124:A]

It was customary also, on this eve, for the young men and women to exchange their clothes, which was termed _Mumming_ or _Disguising_; and when thus dressed in each other's garments, they would go from one neighbour's cottage to another, singing, dancing, and partaking of their good cheer; a species of masquerading which, as may be imagined, was often productive of the most licentious freedoms.

On the succeeding morning, the first of the New Year, presents, called new-year's gifts, were given and received, with the mutual expression of good wishes, and particularly that of a _happy New Year_. The compliment was sometimes paid at each other's doors in the form of a song; but more generally, especially in the north of England and in Scotland, the house was entered very early in the morning, by some young men and maidens selected for the purpose, who presented the spiced bowl, and hailed you with the gratulations of the season.

The custom of interchanging gifts on this day, though now nearly obsolete, was, in the days of Shakspeare, observed most scrupulously; and not merely in the country, but, as hath been just before hinted, even in the palace of the monarch. In fact the wardrobe and jewelry of Elizabeth appear to have been supported principally by these annual contributions.

As a brief summary of these presents, though given not in the country, but at court, will yet, as including almost every rank in life, from the peer to the dustman, place in a strong light the prevalence of this custom, and point out of what these gifts usually consisted in a town, and therefore, by inference, of what they must have included in the country, its introduction will not, we should hope, be considered as altogether digressive from the nature of our subject.

To Mr. Nichols, who, in his work entitled "Queen Elizabeth's Progresses," has printed, from the original rolls in vellum, some very copious lists of New Year's gifts annually presented to this popular monarch, are we indebted for the following curious enumeration.

"From all these rolls," says he, "and more of them perhaps are still existing, it appears that the greatest part, if not all the peers and peeresses of the realm, all the bishops, the chief officers of state, and several of the Queen's houshold servants, even down to her apothecaries, master cook, serjeant of the pastry, &c. gave New Year's gifts to Her Majesty; consisting, in general, either of a sum of money, or jewels, trinkets, wearing apparel, &c. The largest sum given by any of the temporal lords was 20_l._; but the Archbishop of Canterbury gave 40_l._, the Archbishop of York 30_l._, and the other spiritual lords 20_l._ and 10_l._; many of the temporal lords and great officers, and most of the peeresses, gave rich gowns, petticoats, smocks, kirtles, silk stockings, cypres garters, sweet-bags, doblets, mantles, some embroidered with pearles, garnets, &c. looking-glasses, fans, bracelets, caskets studded with precious stones, jewels ornamented with sparks of diamonds in various devices, and other costly trinkets. Sir Gilbert Dethick, Garter King of Arms, gave a book of the states in King William the Conqueror's time, and a book of the arms of the noblemen in Henry the Fifth's time; Absolon, the master of the Savoy, a Bible covered with cloth of gold, garnished with silver, and gilt, and two plates with the royal arms; _Petruchio Ubaldino_, a book covered with vellum of Italian; Lambarde, the antiquary, his Pandecta of all the Rolls, &c. in the Tower of London. The Queen's physician presented her with a box of foreign sweetmeats; another physician with two pots, one of green ginger, the other of orange flowers; two other physicians gave each a pot of green ginger, and a pot of the rinds of lemons; her apothecaries a box of lozenges, a box of ginger candy, a box of grene ginger, a box of orange candit, a pot of conserves, a pot of wardyns condite, a box of wood with prunolyn, and two boxes of _manus Christi_; Mrs. Blanch a Parry, a little box of gold to put in cumphetts, and a little spoon of gold; Mrs. Morgan a box of cherryes, and one of aberycocks; her master cook a fayre marchepayne; her serjeant of the pastry a fayre pie of quinces oringed; a box of peaches of Jenneway (Genoa); a great pie of quynses and wardyns guilte; _Putrino_, an Italian, presented her with two pictures; _Innocent Corry_ with a box of lutestrings; _Ambrose Lupo_ with another box of lutestrings, and a glass of sweet water; _Petro Lupo_, _Josepho Lupo_, and _Cæsar Caliardo_, each with a pair of sweet gloves; a cutler with a meat knyfe with a fan haft of bone, _a conceit in it_; _Jaromy_ with twenty-four drinking-glasses; _Jeromy Bassano_ two drinking-glasses; Smyth, _dustman_, two boltes

of cambrick."[126:A]

The Queen, though she made returns in plate and other articles, took sufficient care that the balance should be in her own favour; hence, as the custom was found to be lucrative, and had indeed been practised with success by her predecessors on the throne, it was encouraged and rendered fashionable to an extent hitherto unprecedented in this kingdom. In the country, however, with the exception of the extensive households of the nobility, this interchange was conducted on the pure basis of reciprocal kindness and good will, and without any view of securing patronage or support; it was, indeed, frequently the channel through which charity delighted to exert her holy influence, and though originating in the heathen world, became sanctified by the Christian virtues.

To the rejoicings on New Year's tide succeeded, after a short interval, the observance of the TWELFTH DAY, so called from its being the twelfth after the Nativity of our Saviour, and the day on which the _Eastern Magi_, guided by the star, arrived at Bethlehem to worship the infant Jesus.

This festive day, the most celebrated of the twelve for the peculiar conviviality of its rites, has been observed in this kingdom ever since the reign of Alfred, in whose days, says Collier, "a Law was made with relation to Holidays, by virtue of which the _twelve_ days _after_ the Nativity of our Saviour were made Festivals."[127:A]

In consequence of an idea, which seems generally to have prevailed, that the _Eastern Magi_ were kings, this day has been frequently termed the _Feast of the Three Kings_; and many of the rites with which it is attended, are founded on this conception; for it was customary to elect, from the company assembled on this occasion, a king or queen, who was usually elevated to this rank by the fortuitous division of a cake containing a bean or piece of coin, and he or she to whom this symbol of distinction fell, in dividing the cake, was immediately chosen king or queen, and then forming their ministers and court from the company around, maintained their state and character until midnight.

The _Twelfth Cake_ was almost always accompanied by the _Wassail Bowl_, a composition of spiced wine or ale, or mead, or metheglin, into which was thrown roasted apples, sugar, &c. The term _Wassail_, which in our elder poets is connected with much interesting imagery, and many curious rites, appears to have been first used in this island during the well-known interview between Vortigern and Rowena. Geoffrey of Monmouth relates, on the authority of Walter Calenius, that this lady, the daughter of Hengist, knelt down, on the approach of the king, and presenting him with a cup of wine, exclaimed "Lord king _wæs heil_," that is, literally "Health be to you." Vortigern being ignorant of the Saxon language, was informed by an interpreter, that the purport of these words was to wish him health, and that he should reply by the expression _drinc-heil_, or "Drink the health;" accordingly, on his so doing, Rowena drank, and the king receiving the cup from her hand, kissed and pledged her.[128:A] Since this period, observes the historian, the custom has prevailed in Britain of using these words whilst drinking; the person who drank to another saying _was-heil_, and he who received the cup answering _drinc-heil_.

It soon afterwards became a custom in villages, on Christmas-Eve, New Year's Eve, and Twelfth Night, for itinerant minstrels to carry to the houses of the gentry, and others, where they were generally very hospitably received, a bowl of spiced wine, which being presented with the Saxon words just mentioned, was therefore called a _Wassail-bowl_. A bowl or cup of this description was likewise to be found in almost every nobleman's and gentleman's house, (and frequently of massy silver,) until the middle of the seventeenth century, and which was in perpetual requisition during the revels of Christmas. In "_The Antiquarian Repertory_, vol. i. p. 217," relates Mr. Douce, "there is an account, accompanied with an engraving, of an oaken chimney-piece in a very old house at Berlen, near Snodland in Kent, on which is carved a wassel-bowl resting on the branches of an apple-tree, alluding, probably, to part of the materials of which the liquor was composed. On one side is the word =wassheil=, and on the other =drincheile=."[129:A] "This is certainly," he adds, "a very great curiosity of its kind, and at least as old as the fourteenth century. Edmund Mortimer, Earl of March, in his will gave to Sir John Briddlewood a silver cup called _wassail_: and it appears that John Duke of Bedford, the regent, by his first will bequeathed to John Barton, his maitre d'hotel, a silver cup and cover, on which was inscribed WASHAYL."[129:B]

In consequence of the _Wassail-bowl_ being peculiar to scenes of revelry and festivity, the term _wassail_ in time became synonymous with feasting and carousing, and has been used, therefore, by many of our poets either to imply drinking and merriment, or the place where such joviality was expected to occur. Thus Shakspeare makes Hamlet say of the king "draining his draughts of Rhenish down," that he

"Keeps _wassel_:"[129:C]

and in Macbeth, the heroine of that play declares that she will convince the two chamberlains of Duncan

"With wine and _wassel_."[129:D]

In Anthony and Cleopatra also, Cæsar, advising Anthony to live more temperately, tells him to leave his

"Lascivious _wassals_."[129:E]

And lastly, in Love's Labour's Lost, Biron, describing the character of Boyet, says,

"He is wit's pedler: and retails his wares At wakes, and _wassels_, meetings, markets, fairs."[130:A]

Ben Jonson has given us two curious personifications of the Wassal; the first in his Forest, No. 3. whilst giving an account of a rural feast in the hall of Sir Robert Wroth; he says,

"The rout of rural folk come thronging in, Their rudenesse then is thought no sin— The jolly _Wassal_ walks the often round, And in their cups their cares are drown'd:"[130:B]

and the second in "Christmas, His Masque, as it was presented at Court 1616," where _Wassall_, as one of the ten children of Christmas, is represented in the following quaint manner. _Like a neat Sempster, and Songster; her Page bearing a browne bowle, drest with Ribbands, and Rosemarie before her._[130:C]

Fletcher, in his Faithful Shepherdess, has given a striking description of the festivity attendant on the Wassal bowl:

——— "The woods, or some near town That is a neighbour to the bordering down, Hath drawn them thither, 'bout some lusty sport, Or spiced _Wassel-Boul_, to which resort All the young men and maids of many a cote, Whilst the trim minstrell strikes his merry note."[130:D]

The persons thus accompanying the Wassal bowl, especially those who danced and played, were called _Wassailers_, an appellation which it was afterwards customary to bestow on all who indulged, at any season, in intemperate mirth. Hence Milton introduces his Lady in Comus making use of the term in the following beautiful passage:

————————— "Methought it was the sound Of riot and ill-manag'd merriment, Such as the jocund flute, or gamesome pipe Stirs up among the loose unletter'd hinds, When for their teeming flocks, and granges full, In wanton dance, they praise the bounteous Pan, And thank the gods amiss. I should be loath To meet the rudeness, and swill'd insolence, Of such late _wassailers_."[131:A]

During the reigns of Elizabeth and James I. the celebration of Twelfth Night was, equally with Christmas-Day, a festival through the land, and was observed with great ostentation and ceremony in both the Universities, at Court, at the Temple, and at Lincoln's and Gray's-Inn. Many of the Masques of Ben Jonson were written for the amusement of the royal family on this night, and Dugdale in his _Origines Juridicales_, has given us a long and particular account of the revelry at the Temple on each of the twelve days of Christmas, in the year 1562. It appears from this document that the hospitable rites of St. Stephen's Day, St. John's Day, and Twelfth Day, were ordered to be exactly alike, and as many of them are, in their nature, perfectly rural, and were, there is every reason to suppose, observed, to a certain extent, in the halls of the country-gentry and substantial yeomanry, a short record here, of those that fall under this description, cannot be deemed inapposite.

The breakfast on Twelfth Day is directed to be of brawn, mustard, and malmsey; the dinner of two courses, to be served in the hall, and after the first course "cometh in the Master of the Game, apparalled in green velvet: and the Ranger of the Forest also, in a green suit of satten; bearing in his hand a green bow and divers arrows, with either of them a hunting horn about their necks: blowing together three blasts of venery, they pace round about the fire three times. Then the Master of the Game maketh three curtesies," kneels down, and petitions to be admitted into the service of the Lord of the Feast.

"This ceremony performed, a huntsman cometh into the hall, with a fox and a purse-net; with a cat, both bound at the end of a staff; and with them nine or ten couple of hounds, with the blowing of hunting-horns. And the fox and cat are by the hounds set upon, and killed beneath the fire. This sport finished, the Marshal (an officer so called, who, with many others under different appellations, were created for the purpose of conducting the revels) placeth them in their several appointed places."

After the second course, the "antientest of the Masters of the Revels singeth a song, with the assistance of others there present;" and after some repose and revels, supper, consisting of two courses, is then served in the hall, and, being ended, "the Marshall presenteth himself with drums afore him, mounted upon a scaffold, born by four men; and goeth three times round about the

harthe, crying out, aloud, 'A Lord, a Lord,' &c., then he descendeth, and goeth to dance."

"This done, the Lord of Misrule (an officer whose functions will be afterwards noticed) addresseth himself to the Banquet; which ended with some minstralsye, mirth and dancing, every man departeth to rest."[133:A]

Herrick, who was the contemporary of Shakspeare for the first twenty-five years of his life, that is, from the year 1591 to 1616, has given us the following curious and pleasing account of the ceremonies of Twelfth Night, as we may suppose them to have been observed in almost every private family:

"TWELFTH-NIGHT,

OR KING AND QUEEN.

Now, now the mirth comes With the cake full of plums, Where Beane's the king of the sport here; Beside, we must know, The Pea also Must revell, as Queene, in the court here.

Begin then to chuse, This night as ye use, Who shall for the present delight here, Be a King by the lot, And who shall not Be Twelfe-day Queene for the night here.

Which knowne, let us make Joy-sops with the cake; And let not a man then be seen here, Who unurg'd will not drinke To the base from the brink A health to the King and the Queene here.

Next crowne the bowle full With gentle lambs-wooll; Adde sugar, nutmeg and ginger, With store of ale too; And thus ye must doe To make the _wassaile_ a swinger.

Give then to the King And Queene wassailing; And though with ale ye be whet here; Yet part ye from hence, As free from offence, As when ye innocent met here." _Herrick's Hesperides_, p. 376, 377.

The _Twelfth Day_ was the usual termination of the festivities of Christmas with the higher ranks; but with the vulgar they were frequently prolonged until Candlemas, to which period it was thought a point of much importance to retain a portion of their Christmas cheer.

It should not be forgotten here, that Shakspeare has given the appellation of _Twelfth Night_ to one of his best and most finished plays. No reason for this choice is discoverable in the drama itself, and from its adjunctive title of _What You Will_, it is probable, that the name was meant to be no otherwise appropriate than as designating an evening on which dramatic mirth and recreation were, by custom, peculiarly expected and always acceptable.[134:A]

It appears from a passage from Warner's Albion's England, that between Twelfth Day and Plough-Monday, a period was customarily fixed upon for the celebration of games in honour of the Distaff, and which was termed ROCK-DAY.[135:A] The notice in question is to be found in the lamentations of the Northerne-man over the decline of festivity, where he exclaims,

"_Rock_, and plow-mondaies, _gams_ sal gang, With saint-feasts and kirk sights."[135:B]

That this festival was observed not only during the immediate days of Warner and Shakspeare, but for some time afterwards, we learn from a little poem by Robert Herrick, which was probably written between the years 1630 and 1640. Herrick was born in 1591, and published his collection of poems, entitled Hesperides, in 1648. He gives us in his title the additional information that _Rock_, or _Saint Distaff's Day_, was the morrow after Twelfth Day; and he advises that it should terminate the sports of Christmas.

"SAINT DISTAFF'S OR THE MORROW AFTER TWELFTH-DAY.

Partly worke and partly play Ye must on S. _Distaff's day_: From the plough soone free your teame; Then come home and fother them. If the Maides a spinning goe, Burne the flax, and fire the tow: Scorch their plackets, but beware That ye singe no maiden-haire. Bring in pailes of water then, Let the Maides bewash the men. Give S. _Distaffe_ all the right, Then bid Christmas sport _good night_. And next morrow, every one To his owne vocation."[136:A]

The first Monday after Twelfth Day used to be celebrated by the ploughmen as a Holiday, being the season at which the labours of the plough commenced, and hence the day has been denominated PLOUGH-MONDAY. Tusser, in his poem on husbandry, after observing that the "old guise must be kept," recommends the ploughmen on this day to the hospitality of the good huswife:

"Good huswives, whom God hath enriched ynough, forget not the feasts, that belong to the plough: The meaning is only to joy and be glad, for comfort with labour, is fit to be had."

He then adds,

"Plough-Munday, next after that Twelftide is past, bids out with the plough, the worst husband is last: If plowman get hatchet, or whip to the skreene, maids loveth their cocke, if no water be seene."

These lines allude to a custom prevalent in the sixteenth and seventeenth centuries, and which Mr. Hilman, in a note on the passage, has thus explained: "After Christmas, (which formerly, during the twelve days, was a time of very little work,) every gentleman feasted the farmers, and every farmer their servants and task-men. _Plough-monday_ puts them in mind of their business. In the morning the men and maid-servants strive who shall shew their diligence in rising earliest; if the ploughman can get his whip, his plough-staff, hatchet, or any thing that he wants in the field, by the fire-side, before the maid hath got her kettle on, then the maid loseth her _Shrovetide_ cock, and it wholly belongs to the men. Thus did our forefathers strive to allure youth to their duty, and provided them innocent mirth, as well as labour. On this _Plough-Monday_ they have a good supper and some strong drink, that they might not go immediately out of one extreme into another."[137:A]

In the northern and north-western parts of England, the entire day was usually consumed in parading the streets, and the night was devoted to festivity. The ploughmen, apparently habited only in their shirts, but in fact with flannel jackets underneath, to keep out the cold, and these shirts decorated with rose-knots of various coloured riband, went about collecting what they called "_plough-money_ for drink." They were accompanied by a plough, which they dragged along, and by music, and not unfrequently two of the party were dressed to personate an _old woman_, whom they called _Bessy_, and a _Fool_, the latter of these characters being covered with skins, with a hairy cap on his head, and the tail of some animal pendent from his back. On one of these antics was devolved the office of collecting money from the spectators by rattling a box, into which their contributions were dropped, while the rest of the ploughmen were engaged in performing a _sword-dance_, a piece of pageantry derived from our northern ancestors, and of which Olaus Magnus has left us an accurate description in his history of the Gothic nations.[137:B] It consisted, for the most part, in forming various figures with the swords, sheathed and unsheathed, commencing in slow time, and terminating in very rapid movements, which required great agility and address to be conducted with safety and effect.[137:C]

It was the opinion of Dr. Johnson that Shakspeare alluded to the _sword-dance_, where, in _Anthony and Cleopatra_, he makes his hero observe of Augustus, that

——————— "He, at Philippi, kept His sword even like a dancer."[138:A]

But Mr. Malone has remarked, with more probability, that the allusion is to the English custom of dancing with a sword _worn by the side_; in confirmation of which idea, he quotes a passage from _All's Well That Ends Well_, where Bertram, lamenting that he is kept from the wars, says,

"I shall stay here the forehorse to a smock, Creaking my shoes on the plain masonry, Till honour be bought up, and no _sword worn_. But one to _dance_ with."[138:B]

It has been observed in a preceding page, that, among the common people, the festivities of Christmas were frequently protracted to CANDLEMAS-DAY. This was done under the idea of doing honour to the Virgin Mary, whose _purification_ is commemorated by the church at this period. It was generally, remarks Bourne, "a day of festivity, and more than ordinary observation among women, and is therefore called the _Wives Feast-Day_."[138:C] The term _Candlemas_, however, seems to have arisen from a custom among the Roman Catholics, of consecrating tapers on this day, and bearing them about lighted in procession, to which they were enjoined by an edict of Pope Sergius, A. D. 684; but on what foundation is not accurately ascertained. At the Reformation, among the rites and ceremonies which were ordered to be retained in a convocation of Henry VIII., this is one, and expressedly because it was considered as symbolical of the spiritual illumination of the Gospel.[138:D]

From Candlemas to Hallowmas, the tapers which had been lighted all the winter in Cathedral and Conventual Churches ceased to be used; and so prevalent, indeed, was the relinquishment of candles on this day in domestic life, that it has laid the foundation of one of the proverbs in the collection of Mr. Ray:

On _Candlemas-day_ throw _Candle_ and _Candlestick_ away.

On this day likewise the Christmas greens were removed from churches and private houses. Herrick, who may be considered as the contemporary of Shakspeare, being five-and-twenty at the period of the poet's death, has given us a pleasing description of this observance; he abounds, indeed, in the history of local rites, and, though surviving beyond the middle of the seventeenth century, paints with great accuracy the manners and superstitions of the Shakspearean era. He has paid particular attention to the festival that we are describing, and enumerates the various greens and flowers appropriated to different seasons in a little poem entitled

"CEREMONIES FOR CANDLEMASSE EVE.

DOWN with the Rosemary and Bayes, Down with the Misleto; Instead of Holly, now up-raise The greener Box (for show).

The Holly hitherto did sway; Let Box now domineere; Untill the dancing Easter-day, On Easter's Eve appeare.

Then youthfull Box which now hath grace, Your houses to renew; Grown old, surrender must his place, Unto the crisped Yew.

When Yew is out, then Birch comes in, And many Flowers beside; Both of a fresh and fragrant kinne, To honour Whitsontide.

Green Bushes then, and sweetest Bents, With cooler Oken boughs; Come in for comely ornaments, To re-adorn the house."[140:A]

The usage which we have alluded to, of preserving the Christmas cheer and hospitality to Candlemas, is immediately afterwards recorded and connected with a singular superstition, in the following poems under the titles of

"CEREMONIES FOR CANDLEMASSE DAY.

KINDLE the Christmas Brand, and then Till sunne-set, let it burne; Which quencht, then lay it up agen, Till Christmas next returne.

Part must be kept wherewith to teend[140:B] The Christmas Log next yeare; And where 'tis safely kept, the fiend Can do no mischiefe there.——

* * * * *

End now the white-loafe, and the pye, And let all sports with Christmas dye."[140:C]

To the exorcising power of the Christmas Brand is added, in the subsequent effusion, a most alarming denunciation against those who heedlessly leave in the Hall on Candlemas Eve, any the smallest portion of the Christmas greens.

"CEREMONY UPON CANDLEMAS EVE

DOWN with the Rosemary, and so Down with the Baies, and Misletoe: Down with the Holly, Ivie, all Wherewith ye drest the Christmas Hall: That so the superstitious find No one least Branch there left behind: For look, how many leaves there be, Neglected there, maids, trust to me, So many _goblins_ you shall see."[141:A]

The next important period of feasting in the country occurred at SHROVE-TIDE, which among the Roman Catholics was the time appointed for _shriving_ or _confession of sins_, and was also observed as a _carnival_ before the commencement of Lent. The former of these ceremonies was dispensed with at the Reformation; but the rites attending the latter were for a long time supported with a rival spirit of hilarity. The Monday and Tuesday succeeding _Shrove_ Sunday, called _Collop Monday_ and _Pancake Tuesday_, were peculiarly devoted to _Shrovetide Amusement_; the first having been, in papal times, the period at which they took leave of flesh, or slices of meat, termed _collops_ in the north, which had been preserved through the winter by salting and drying, and the second was a relic of the feast preceding Lent; eggs and collops therefore on the Monday, and pancakes, as a delicacy, on the Tuesday, were duly if not religiously served up.

Tusser, in his very curious and entertaining poem on agriculture, thus notices some of the old observances at _Shrovetide_:—

"At Shroftide to shroving, go thresh the fat hen, If blindfold can kill her, then give it thy men: Maids, fritters and pancakes, ynow see ye make, Let slut have one pancake, for company sake."

For an explanation of the obsolete custom of "threshing the fat hen," we are indebted to Mr. Hilman. "The hen," says he, "is hung at a fellow's back, who has also some horse-bells about him; the rest of the fellows are blinded, and have boughs in their hands, with which they chase this fellow and his hen about some large court or small enclosure. The fellow with his hen and bells shifting as well as he can, they follow the sound, and sometimes hit him and his hen; at other times, if he can get behind one of them, they

thresh one another well favour'dly; but the jest is, the maids are to blind the fellows, which they do with their aprons, and the cunning baggages will endear their sweet-hearts with a peeping hole, whilst the others look out as sharp to hinder it. After this the hen is boil'd with bacon, and store of pancakes and fritters are made. She that is noted for lying in bed long, or any other miscarriage, hath the first pancake presented to her, which most commonly falls to the dogs share at last, for no one will own it their due." Mr. Hilman concludes his comment on the text with a singular remark; "the loss of the above laudable custom, is one of the benefits we have got by smoaking tobacco."[142:A]

Shakspeare has twice noticed this season of feasting and amusement; first, in _All's Well That Ends Well_, where he makes the Clown tell the Countess (among a string of other similes), that his answer is "as fit as a pancake for Shrove-tuesday[143:A];" and in the _Second Part of King Henry IV._ he has introduced _Silence_ singing the following song:—

"Be merry, be merry, my wife's as all;[143:B] For women are shrews, both short and tall: 'Tis merry in hall, when beards wag all, And welcome merry _shrove-tide_. Be merry, be merry, &c."

The third line of this song appears to have been proverbial, and of considerable antiquity; for Adam Davie, who flourished about 1312, has the same imagery with the same rhyme, in his _Life of Alexander_:

"Merry swithe it is in halle, When the _berdes waveth alle_."[143:C]

And the subsequent passage, quoted by Mr. Reed from a writer contemporary with Shakspeare, proves, that it was a common burden or under song in the halls of our gentry at that period:—"which done, grace said, and the table taken up, the plate presently conveyed into the pantrie, the hall summons this consort of companions (upon payne to dyne with Duke Humphfrie, or to kisse the hare's foot,) to appear at the first call: where a song is to be sung, the under song or holding whereof is, _It is merrie in haul where beards wag all._" The Serving-man's Comfort, 1598, sign. C.[144:A]

The evening of _Shrove-Tuesday_ was usually appropriated, as well in the country as in town, to the exhibition of dramatic pieces. Not only at Court, where Jonson was occasionally employed to write Masques on this night[144:B], but at both the Universities, in the provincial schools, and in the halls of the gentry and nobility, were these the amusements of _Shrovetide_, during the days of Elizabeth and James. Warton, speaking of these ephemeral plays, adds, in a note, "I have seen an anonymous comedy, APOLLO SHROVING, composed by the Master of Hadleigh-school, in Suffolk[144:C], and acted by his scholars, on Shrove-tuesday, Feb. 7, 1626, printed 1627. 8vo. published, as it seems, by E. W. _Shrove-tuesday_, as the day immediately preceding Lent, was always a day of extraordinary sport and feasting."—"Some of these festivities," he proceeds to say, "still remain in our universities. In the PERCY HOUSHOLD-BOOK, 1512, it appears, that the clergy and officers of Lord Percy's chapel performed a play _before his lordship upon Shrowftewesday at night_." Pag. 345.[144:D]

The cruel custom of _Cock-throwing_, which, until lately, was a diversion peculiar to this day, seems to have originated from the barbarous, yet less savage, amusement of _Cock-fighting_. "Every yeare on _Shrove-Tuesday_," says Fitzstephen, who wrote in the reign of Henry II., "the schoole-boyes doe bring cockes of the game to their master, and all the forenoone they delight themselves in Cock-fighting."[145:A] At what period this degenerated into Cock-throwing cannot now be ascertained; Chaucer seems to allude to it in his _Nonnes Priests' Tale_, where the Cock revenges himself on the Priest's son, because he

———————— "gave hym a knocke Upon his legges, when he was yonge and nice;"

and that it was common in the sixteenth century, we have the testimony of Sir Thomas More, who, describing the state of childhood, speaks of his skill in casting a cok-stele, that is, a stick or cudgel to throw at a cock.[145:B]

The first effective blow directed against this infamous sport, was given by the moral pencil of Hogarth, who in one of his prints called _The Four Stages of Cruelty_, has represented, among other puerile diversions, a groupe of boys _throwing at a Cock_, and, as Trusler remarks, "beating the harmless feathered animal to jelly."[145:C] The benevolent satire of this great artist gradually produced the necessary reform, and for some time past, the magistrates have so generally interdicted the practice, that the pastime may happily be considered as extinct.[145:D]

EASTER-TIDE, or the week succeeding Easter-Sunday, afforded another opportunity for rejoicing, and was formerly a season of great festivity. Not only, as bound by every tie of gratitude to do, did man rejoice on this occasion, but it was the belief of the vulgar that the sun himself partook of the exhilaration, and regularly danced on Easter-Day. To see this glorious spectacle, therefore, it was customary for the common people to rise before the sun on Easter-morning, and though, as we may conclude, they were

constantly disappointed, yet might the habit occasionally lead to serious thought and useful contemplation; metaphorically considered, indeed, the idea may be termed both just and beautiful, "for as the earth and her valleys standing thick with corn, are said _to laugh and sing_; so, on account of the Resurrection, the heavens and the sun may be said to dance for joy; or, as the Psalmist words it, the _heavens may rejoice and the earth may be glad_."[146:A]

The great amusement of the Easter-holidays consisted in playing at hand-ball, a game at which, say the ritualists Belithus and Durandus, bishops and archbishops used, upon the continent at this period, to recreate themselves with their inferior clergy[147:A]; nor was it uncommon for corporate bodies on this occasion in England to amuse themselves in a similar way with their burgesses and young people; antiently this was the custom, says Mr. Brand, at Newcastle, at the feasts of Easter and Whitsuntide, when the mayor, aldermen, and sheriff, accompanied by great numbers of the burgesses, used to go yearly at these seasons to the Forth, or little mall of the town, with the mace, sword, and cap of maintenance carried before them, and not only countenance, but frequently join in the diversions of hand-ball, dancing, &c.[147:B]

The constant prize at hand-ball, during Easter, was a _tansy-cake_, supposed to be allusive to the _bitter herbs_ used by the Jews on this festival. Selden, the contemporary of Shakspeare, speaking of our chief holidays, remarks, that "our Meats and Sports have much of them relation to Church-Works. The coffin of our _Christmas Pies_, in shape long, is in imitation of the Cratch[147:C]: our chusing Kings and Queens on Twelfth Night, hath reference to the three kings. So likewise our eating of fritters, _whipping_ of tops, _roasting_ of herrings, Jack of Lents, &c. they are all in imitation of Church-Works, emblems of martyrdom. Our _Tansies at Easter_ have reference to the _bitter Herbs_; though at the same time 'twas always the fashion for a man to have a _Gammon of Bacon_, to shew himself to be no _Jew_."[147:D] Fuller has noticed this Easter game under his Cheshire, where, explaining the origin of the proverb "When the daughter is stolen shut Pepper Gate," he says, "The mayor of the city had his daughter, as she was _playing at ball_ with other maidens in Pepper-street, stolen away by a young man through the same gate, whereupon he caused it to be shut up."[148:A]

Another custom which prevailed in this country, during the sixteenth century, at Easter, and is still kept up in some parts of the north, was that of presenting children with _eggs stained with various colours in boiling_, termed _Paste_ or more properly _Pasche Eggs_, which the young people considered in the light of _fairings_. This observance appears to have arisen from a superstition, prevalent among the Roman Catholics, that eggs were an emblem of the resurrection, and, indeed, in the Ritual of Pope Paul the Fifth, which was composed for the use of England, Ireland, and Scotland, there is a prayer for the consecration of eggs, in which the faithful servants of the Lord are directed to eat this his creature of eggs _on account of the resurrection_. On this custom Mr. Brand has well observed, that "the antient Egyptians, if the resurrection of the body had been a tenet of their faith, would perhaps have thought an _Egg_ no improper hieroglyphical representation of it. The exclusion of a living creature by incubation, after the vital principle has lain a long while dormant or extinct, is a process so truly marvellous, that if it could be disbelieved, would be thought by some a thing as incredible, as that the Author of _Life_ should be able to re-animate the _dead_."[148:B] So prevalent indeed was this custom of _egg-giving_ at Easter, that it forms the basis of an old English proverb, which, in the collection of Mr. Ray, runs thus:

"I'll warrant you for an _egg_ at _Easter_."[148:C]

A popular holiday, called HOKE-DAY, or HOCK-DAY, which used to be celebrated with much festivity in Shakspeare's native county, was usually observed on the Tuesday following the second Sunday after Easter-day. Its origin is doubtful, some antiquaries supposing it was commemorative of the massacre of the Danes in the reign of Ethelred the Unready, which took place on the 13th of November 1002; and others that it was meant to perpetuate the deliverance of the English from the tyrannical government of the Danes, by the death of Hardicanute on Tuesday the 8th of June 1041. At Coventry in Warwickshire, however, it was celebrated in memory of the former event, though the commemoration was held on a day wide apart from that on which the catastrophe occurred, a circumstance which originated in an ordinance of Ethelred himself, who transferred the sports of this day to the Monday and Tuesday in the third week after Easter. John Rouse, or Ross, the Warwickshire historian, says, that this day was distinguished by various sports, in which the people, divided into parties, used to draw each other by ropes[149:A]; a species of diversion of which Spelman has given us a more intelligible account by telling us that it "consisted in the men and women binding each other, and especially the women the men," and that the day, in consequence of this pastime, was called _Binding-Tuesday_.[149:B]

The term _hock_, by which this day is designated, is thus accounted for by Henry of Huntingdon. "The secret letters of Ethelred, directed to all parts of his kingdom from this city (Winchester), ordered that all the Danes indiscriminately should be put to death; and this was executed, as we learn from the chronicle of Wallingford, with circumstances of the greatest cruelty, even upon women

and children, in many parts: but in other places, it seems that the English, instead of killing their guests, satisfied themselves with what was called _hock-shining_, or _houghing_ them, by cutting their ham-strings, so as to render them incapable of serving in war. Hence the sports which were afterwards instituted in our city, and from thence propagated throughout the whole kingdom, obtained the name of _Hocktide merriments_."

It appears from the following passage in Laneham's Account of Queen Elizabeth's Entertainment at Kenelworth Castle, A. D. 1575, that the citizens of Coventry had lately been compelled to give up their annual amusements on _Hock Tuesday_, and took the opportunity of the queen's visit to the Earl of Leicester to petition her for a renewal of the same. "Hereto followed," says Laneham, "as good a sport (methought), presented in an historical cue, by certain good-hearted men of _Coventry_, my Lord's neighbours there; who understanding among them the thing that could not be hidden from any, how careful and studious his Honour was that by all pleasant recreations her Highness might best find herself welcome, and be made gladsome and merry (the groundwork indeed and foundation of his Lordship's mirth and gladness of us all), made petition that they mought renew now their old storial shew: Of argument how the _Danes_, whylome here in a troublous season were for quietness borne withal and suffered in peace; that anon, by outrage and importable insolency, abusing both _Ethelred_ the _King_, then, and all Estates every where beside; at the grievous complaint and counsel of _Huna_ the _King_'s chieftain in wars on a _Saint Brice_'s night, A. D. 1012 (as the book says, that falleth yearly on the thirteenth of November) were all dispatched, and the realm rid. And for because the matter mentioneth how valiantly our _English_ women for love of their country behaved themselves, expressed in actions and rymes after their manner, they thought it mought move some mirth to her Majesty the rather. The thing, said they, is grounded on story, and for pastime wont to be played in our city yearly; without ill example of manners, papistry, or any superstition; and else did so occupy the heads of a number, that likely enough would have had worse meditations; had an ancient beginning and a long continuance; till now of late laid down, they knew no cause why, unless it were by the zeal of certain their preachers, men very commendable for their behaviour and learning, and sweet in their sermons, but somewhat too sour in preaching away their pastime: Wished therefore, that as they should continue their good doctrine in pulpit, so, for matters of policy and governance of the city, they would permit them to the _Mayor_ and _Magistrates_; and said, by my faith, _Master Martyn, they would make their humble petition unto her Highness, that they might have their Plays up again_."[151:A]

As it is subsequently stated that their play was very graciously received by the queen, who commanded it to be represented again on the following Tuesday, and gave the performers two bucks, and five marks in money, we must suppose, that their petition was not rejected, and that they were allowed to renew yearly at Coventry, their favourite diversions on _Hock-Tuesday_. The observance of this day, indeed, was still partially retained in the time of Spelman, who died A. D. 1641[151:B], and even Plott, who lived until 1696, mentions it then as not totally discontinued; but the eighteenth century, we believe, never witnessed its celebration.

We have now reached that period of the year which was formerly dedicated to one of the most splendid and pleasing of our festal rites. The observance of MAY-DAY was a custom which, until the close of the reign of James the First, alike attracted the attention of the royal and the noble, as of the vulgar class. Henry the Eighth, Elizabeth, and James, patronized and partook of its ceremonies; and, during this extended era, there was scarcely a village in the kingdom but what had a _May-pole_, with its appropriate games and dances.

The origin of these festivities has been attributed to three different sources, _Classic_, _Celtic_, and _Gothic_. The first appears to us to establish the best claim to the parentage of our May-day rites, as a relique of the _Roman Floralia_, which were celebrated on the last four days of April, and on the first of May, in honour of the goddess Flora, and were accompanied with dancing, music, the wearing of garlands, strewing of flowers, &c. The _Beltein_, or rural sacrifice of the Highlanders on this day, as described by Mr. Pennant and Dr. Jamieson[152:A], seems to have arisen from a different motive, and to have been instituted for the purpose of propitiating the various noxious animals which might injure or destroy their flocks and herds. The Gothic anniversary on May-day makes a nearer approach to the general purpose of the _Floralia_, and was intended as a thanksgiving to the sun, if not for the return of flowers, fruit, and grain, yet for the introduction of a better season for fishing and hunting.[152:B]

The modes of conducting the ceremonies and rejoicings on _May-day_, may be best drawn from the writers of the Elizabethan period, in which this festival appears to have maintained a very high degree of celebrity, though not accompanied with that splendour of exhibition which took place at an earlier period in the reign of Henry the Eighth. It may be traced, indeed, from the era of Chaucer, who, in the conclusion of his _Court of Love_, has described the _Feast of May_, when

"—— Forth goth all the court both most and lest, To fetch the floures fresh, and braunch and blome— And namely hauthorn brought both page and grome And than rejoysen in their great delite: Eke ech at other throw the floures bright, The primerose, the

violete, and the gold, With fresh garlants party blew and white."[153:A]

And, it should be observed, that this, the simplest mode of celebrating May-day, was as much in vogue, in the days of Shakspeare, as the more complex one, accompanied by the morris-dance, and the games of Robin Hood. The following descriptions, by Bourne and Borlase, manifestly allude to the costume of this age, and to the simpler mode of commemorating the 1st of May: "On the _Calends_, or the 1st day of May," says the former, "commonly called _May-day_, the juvenile part of both sexes were wont to rise a little after midnight, and walk to some neighbouring wood, accompany'd with music, and the blowing of horns, where they break down branches from the trees, and adorn them with _nosegays_ and _crowns of flowers_. When this is done, they return with their booty homewards, about the rising of the sun, and make their doors and windows to triumph in the flowery spoil. The after part of the day, is chiefly spent in dancing round a tall poll, which is called a _May Poll_; which being placed in a convenient part of the village, stands there, as it were consecrated to the _Goddess of Flowers_, without the least violence offered it, in the whole circle of the year."[153:B] "An antient custom," says the latter, "still retained by the Cornish, is that of decking their doors and porches on the first of May with green sycamore and hawthorn boughs, and of planting trees, or rather stumps of trees, before their houses: and on May-eve, they from towns make excursions into the country, and having cut down a tall elm, brought it into town, fitted a straight and taper pole to the end of it, and painted the same, erect it in the most public places, and on holidays and festivals adorn it with flower garlands, or insigns and streamers."[154:A]

Now both these passages are little more than a less extended account of what Philip Stubbes was a witness of, and described, in the year 1595, in his puritanical work, entitled _The Anatomie of Abuses_. "Against Maie-day," relates this vehement declaimer, "every parish, towne, or village, assemble themselves, both men, women, and children; and either all together, or dividing themselves into companies, they goe some to the woods and groves, some to the hills and mountaines, some to one place, some to another, where they spend all the night in pleasant pastimes, and in the morning they return bringing with them, birche boughes and branches of trees to deck their assemblies withal. But their chiefest jewel they bring from thence is the maie-pole, which they bring home with great veneration, as thus—they have twentie or fortie yoake of oxen, every oxe having a sweete nosegaie of flowers tied to the tip of his hornes, and these oxen drawe home the maie-poale, their stinking idol rather, which they covered all over with flowers and hearbes, bound round with strings from the top to the bottome, and sometimes it was painted with variable colours, having two or three hundred men, women, and children following it with great devotion. And thus equipp'd it was reared with handkerchiefes and flagges streaming on the top, they strawe the ground round about it, they bind green boughs about it, they set up summer halles, bowers, and arbours, hard by it, and then fall they to banquetting and feasting, to leaping and dauncing about it, as the heathen people did at the dedication of their idolls.—I have heard it crediblie reported," he sarcastically adds, "by men of great gravity, credite, and reputation, that of fourtie, three score, or an hundred maides going to the wood, there have scarcely the third part of them returned home againe as they went."[154:B]

Browne also has given a similar description of the May-day rites in his Britannia's Pastorals:—

"As I have seene the Lady of the May Set in an arbour —— —— —— Built by the May-pole, where the jocund swaines Dance with the maidens to the bagpipe's straines, When envious night commands them to be gone, Call for the merry yongsters one by one, And for their well performance some disposes, To this a garland interwove with roses; To that a carved hooke, or well-wrought scrip, Gracing another with her cherry lip: To one her garter, to another then A handkerchiefe cast o're and o're agen; And none returneth empty, that hath spent His paynes to fill their rurall merriment."[155:A]

The custom of rising early on a May-morning to enjoy the season, and honour the day, is thus noticed by Stow:—"In the month of May," he says, "namely, on May-day in the morning, every man, except impediment, would walke into the sweete meddowes and green woods, there to rejoice their spirits, with the beauty and savour of sweet flowers, and with the harmony of birds, praysing God in their kind[155:B];" and Shakspeare has repeated references to the same observance; in _Midsummer-Night's Dream_, Lysander tells Hermia,

—— "I did meet thee once with Helena, _To do observance to a morn of May_;"[155:C]

and again, in the same play, Theseus says,—

"No doubt they rose up early, _to observe The rite of May_."[156:A]

So generally prevalent was this habit of early rising on May-day, that Shakspeare makes one of his inferior characters in _King Henry the Eighth_ exclaim,—

"Pray, sir, be patient; _'tis as much impossible_ (Unless we sweep them from the door with cannons) _To scatter them, as 'tis to make them sleep On May-day morning; which will never be_."[156:B]

Herrick, the minute describer of the customs and superstitions of his times, which were those of Shakspeare, and the _immediately_ succeeding period, has a poem called _Corinna's Going A Maying_, which includes most of the circumstances hitherto mentioned; he thus addresses his mistress:—

"Get up —— and see The dew bespangling herbe and tree: Each flower has wept, and bow'd toward the east, Above an houre since;—it is sin, Nay profanation to keep in; When as a thousand virgins on this day, Spring sooner than the lark, to fetch in May! Come, my Corinna, come; and comming marke How each field turns a street, each street a parke Made green, and trimm'd with trees; see how Devotion gives each house a bough, Or branch: each porch, each doore, ere this, An arke, a tabernacle is Made up of white-thorn neatly enterwove.—

There's not a budding boy, or girle, this day But is got up, and gone to bring in May: A deale of youth, ere this, is come Back, and with white-thorn laden home. Some have dispatcht their cakes and creame, Before that we have left to dreame: And some have wept, and woo'd, and plighted troth, And chose their priest, ere we can cast off sloth: Many a green gown has been given; Many a kisse, both odde and even: Many a glance too has been sent From out the eye, Love's firmament: Many a jest told of the keyes betraying This night, and locks pickt, yet w'are not a Maying!"[157:A]

With this, the simplest mode of celebrating the rites of May-day, was frequently united, in the days of Henry VIII. and Elizabeth, a groupe of _Morris Dancers_, consisting of several characters, which were often varied both in number, appellation, and dress. The _Morris Dance_ appears to have been introduced into this kingdom about the reign of Edward the Fourth, and is, without doubt, derived from the _Morisco_, a dance peculiar to the _Moors_, and generally termed the _Spanish Morisco_, from its notoriety in Spain, during the dynasty of that people in the peninsula. The _Morris Dance_ in this country, when performed on a May-day, and not connected with the Games of Robin Hood, usually consisted of the Lady of the May, the Fool, or domestic buffoon of the 15th and 16th centuries, a Piper, and two, four, or more, Morris Dancers. The dress of these last personages, who designated the amusement, was of a very peculiar kind; they had their faces blackened to resemble the native Moors, and "in the reign of Henry the Eighth," says Mr. Douce, "they were dressed in gilt leather and silver paper, and sometimes in coats of white spangled fustian. They had purses at their girdles, and garters to which bells were attached[158:A];" but according to Stubbes, who wrote in 1595, the costume had been altered, for he tells us that they were clothed in "greene, yellow, or some other light wanton collour. And as though that were not gawdy ynough," he continues, "they bedeeke themselves with scarffes, ribbons, and laces hanged all over with golde ringes, precious stones, and other jewels: this done, they tie about either legge twentie or fourtie belles, with rich handkerchiefe in their handes, and sometimes laide a crosse over their shoulders and neckes borrowed for the most part of their pretie _Mopsies_ and loving _Bessies_ for bussing them in the darke."[158:B] Feathers, too, were usually worn in their hats, and they had occasionally bells fixed on their arms or wrists, as well as on their legs. That these jingling ornaments were characteristic of, and derived from, the genuine _Moorish Dance_, appears from a plate copied by Mr. Douce from the habits of various nations, published by Hans Weigel at Nuremberg, in 1577, and which represents the figure of an African lady of the kingdom of Fez in the act of dancing, with bells at her feet.[158:C]

It was the business of these motley figures to dance round the May-pole, which was painted of various colours; thus in Mr. Tollett's painted glass window, at Betley in Staffordshire, which represents an English May-game and morris-dance, the May-pole is stained yellow and black, in spiral lines[158:D]; and Shakspeare, in allusion to this custom, makes Hermia tell Helena, whilst ridiculing the tallness of her form, that she is a "painted May-pole[158:E];" so Stubbes, likewise, in a passage previously quoted, says, that the Maie-pole was "painted with variable colours."

That the _morris-dance_ was an almost constant attendant on the May-day festivities, may be drawn from our usual authority, the works of Shakspeare; for, in _All's Well That Ends Well_, the Clown affirms, that his answer will serve all questions

"As fit as a morris for May-day."[159:A]

But, about the commencement of the sixteenth century, or somewhat sooner, probably towards the middle of the fifteenth century, a very material addition was made to the celebration of the rites of May-day, by the introduction of the characters of Robin Hood and some of his associates. This was done with a view towards the encouragement of archery, and the custom was continued even beyond the close of the reign of James I. It is true, that the May-games in their rudest form, the mere dance of lads and lasses round a May-pole, or the simple morris with the Lady of the May, were occasionally seen during the days of Elizabeth; but the

general exhibition was the more complicated ceremony which we are about to describe.

The personages who now became the chief performers in the _morris-dance_, were four of the most popular outlaws of Sherwood forest; that Robin Hood, of whom Drayton says,—

"In this our spacious isle, I think there is not one, But he hath heard some talk of him and little John;— Of Tuck the merry friar, which many a sermon made In praise of Robin Hood, his outlaws and their trade;— "Of Robin's" mistress dear, his loved Marian, —— —— —— which wheresoe'er she came, Was sovereign of the woods, chief lady of the game: Her clothes tuck'd to the knee, and dainty braided hair, With bow and quiver arm'd;"[159:B]

characters which Warner, the contemporary of Drayton and Shakspeare, has exclusively recorded as celebrating the rites of May; for, speaking of the periods of some of our festivals, and remarking that "ere penticost begun our May," he adds,

"Tho' (_then_) Robin Hood, liell John, frier Tucke, And Marian, deftly play, And lord and ladie gang till kirke With lads and lasses gay:

Fra masse and een sang sa gud cheere And glee on ery greene."[160:A]

These four characters, therefore, _Robin Hood_, _Little John_, _Friar Tuck_, and _Maid Marian_, although no constituent parts of the original English morris, became at length so blended with it, especially on the festival of May-day, that until the practice of archery was nearly laid aside, they continued to be the most essential part of the pageantry.

In consequence of this arrangement, "the old _Robin Hood_ of England," as Shakspeare calls him[160:B], was created the King or Lord of the May, and sometimes carried in his hand, during the May-game, a painted standard.[160:C] It was no uncommon circumstance, likewise, for metrical interludes, of a comic species, and founded on the achievements of this outlaw, to be performed after the morris, on the May-pole green. In Garrick's Collection of Old Plays, occurs one, entitled "A mery Geste of Robyn Hoode, and of hys Lyfe, wyth a newe Playe _for to be played in Maye-Games_, very pleasaunte and full of pastyme;" it is printed at London, in the black letter, for William Copland, and has figures in the title page of Robin Hood and Lytel John.[160:D] Shakspeare appears to allude to these interludes when he represents Fabian, in the _Twelfth Night_, exclaiming on the approach of Sir Andrew Ague-Cheek with his challenge, "More matter for May-morning."[160:E]

Upon this introduction of Robin Hood and his companions into the celebration of May-day, his paramour _Maid Marian_, assumed the office of the former Queen of May. This far-famed lady has, according to Mr. Ritson, no part in the original and more authentic history of Robin Hood; but seems to have been first brought forward when the story of this hero became dramatised, which was at a very early period in this country; and Mr. Douce is of opinion that the name, which is a stranger to English history, has been taken from "a pretty French pastoral drama of the eleventh or twelfth century, entitled _Le jeu du berger et de la bergere_, in which the principal characters are _Robin_ and _Marian_, a shepherd and shepherdess."[161:A] This appears the more probable, as the piece was not only very popular in France, but performed at the season when the May-games took place in England.

Maid Marian, in the days of Shakspeare, was usually represented by a delicate, smooth-faced youth, who was dressed in all the fashionable finery of the times; and this assumption of the female garb gave, not without some reason, great offence to the puritanical dissenters, one of whom, exclaiming against the amusements of May-day, notices this, amongst some other abuses, in the following very curious passage:—"The abuses which are committed in your May-games are infinite. The first whereof is this, that you doe use to attyre in woman's apparrell whom you doe most commonly call _may-marrions_, whereby you infringe that straight commandment whiche is given in Deut. xxii. 5., that men must not put on women's apparrell for feare of enormities. Nay I myself have seene in a may game a troupe, the greater part whereof hath been men, and yet have they been attyred so like into women, that their faces being hidde (as they were indeede) a man coulde not discerne them from women. The second abuse, which of all other is the greatest, is this, that it hath been toulde that your morice dauncers have dannced naked in nettes: what greater enticement unto naughtiness could have been devised? The third abuse is, that you (because you will loose no tyme) doe use commonly to runne into woodes in the night time, amongst maidens, to fet bowes, in so muche as I have hearde of tenne maidens which went to fet May, and nine of them came home with childe."[162:A]

That, in consequence of this custom, effeminate and coxcomical men were sarcastically compared to _Maid Marian_, appears from a passage in a pamphlet by Barnaby Rich, who, satirising the male attire, as worn by the fops of the reigns of Elizabeth and James I., cries out,—"From whence commeth this wearing, and this embroidering of long locks, this curiosity that is used amongst men, in frizeling and curling of their haire, this gentlewoman-like starcht bands, so be-edged and be-laced, _fitter for Maid Marian in a Moris

dance_, than for him that hath either that spirit or courage that shold be in a gentleman."[162:B]

It will not seem surprising that the converse of this was occasionally applicable to the female sex; and that those women who adopted masculine airs and habits should be branded with a similarity to the clown who, though personating the lady of the May, never failed, however nice or affected he might be, to disclose by the boldness and awkwardness of his gesture and manner, both his rank and sex. Thus Falstaff is represented as telling the hostess, when he means to upbraid her for her masculine appearance and conduct, that "for _woman hood_ Maid Marian may be the Deputy's wife of the ward to thee."[162:C] A fancy coronet of gilt metal, or interwoven with flowers, and a watchet coloured tunic, a kirtle or petticoat of green, as the livery of Robin Hood, were customary articles of decoration in the dress of the May-Queen.

Friar Tuck, the next of the four characters which we have mentioned as introduced into the May-games, was the chaplain of Robin Hood, and is noticed by Shakspeare, who makes one of the outlaws, in the _Two Gentlemen of Verona_, swear

"By the bare scalp of _Robin Hood's fat friar_."[163:A]

He is represented in the engraving of Mr. Tollet's window as a Franciscan friar in the full clerical tonsure; for, as Mr. T. observes in giving an account of his window, "when the parish priests were inhibited by the diocesan to assist in the May games, the Franciscans might give attendance, as being exempted from episcopal jurisdiction;" he adds that "most of Shakspeare's friars are Franciscans," and that in Sir David Dalrymple's extracts from the book of the _Universal Kirk_, in the year 1576, he is styled "chaplain to Robin Huid, king of May."[163:B]

The last of this groupe was the boon companion of Robin, the "_brave Little John_," as he is termed in one of the ballads on this popular outlaw, and who "is first mentioned," remarks Mr. Douce, "together with Robin Hood, by Fordun the Scotish historian, who wrote in the fourteenth century, and who speaks of the celebration of the story of these persons in the _theatrical performances_ of his time, and of the minstrel's songs relating to them, which he says the common people preferred to all _other romances_."[163:C]

With these _four_ personages therefore, who were deemed so inseparable, that a character in Peele's Edward I. says, "We will live and die together, like _Robin Hood_, _Little John_, _Friar Tucke_, and _Maide Marian_[163:D]," the performers in the simple English Morris, the _fool_, _Tom the Piper_, and the _Morris Dancers_, peculiarly so called from their dress and function, were, for a time, generally connected. Tom the Piper is thus mentioned by Drayton:

"Myself above Tom Piper to advance, Which so bestirs him in the Morrice-dance For penny wage."[164:A]

And Shakspeare, alluding to the violent gesticulations and music of the Morris dancers says, speaking of Cade the rebel,

———————— "I have seen him Caper upright like a _wild morisco_, Shaking the bloody darts, as he his bells."[164:B]

The music accompanying the _Morris_ and the _May-games_, was either the simple pipe, or the pipe and tabor, or the bag-pipe. In the following passage from a curious controversial pamphlet, published towards the close of the sixteenth century, the morris and the pipe and tabor are thus noticed: "If Menippus, or the man in the moone, be so quick sighted, that he beholds these bitter sweete jests, these railing outcries; this shouting at prelates to cast them downe, and heaving at Martin to hang him up for Martilmas biefe; what would he imagine otherwise, then as that stranger, which seeing a Quintessence (beside the _foole_ and the _Maid Marian_) of all the picked youth, strained out of an whole Endship, footing the _morris about a may pole_, and he, not hearing the crie of the hounds, for the barking of dogs, (that is to say) the minstrelsie for the fidling, the tune for the sound, nor the _pipe for the noise of the tabor_, bluntly demanded if they were not all beside themselves, that they so lip'd and skip'd whithout an occasion."[164:C] To this quotation Mr. Haslewood has annexed the subsequent ludicrous story from a tract entitled, _Hay any worke for Cooper_. It is a striking proof of the singular attraction and popularity of the May-games at this period:—"There is a neighbour of ours, an honest priest, who was sometimes (simple as he now stands) a vice in a play, for want of a better; his name is Gliberie of Hawstead in Essex, hee goes much to the pulpit. On a time, I thinke it was the last _May_, he went up with a full resolution to doe his businesse with great commendations. But, see the fortune of it. A boy in the church, hearing either the _summer lord with his May-game, or Robin Hood with his morice daunce_, going by the church, out goes the boye. Good Glibery, though he were in the pulpit, yet had a mind to his old companions abroad, (a company of merry grigs you must thinke them to be, as merry as a vice on a stage), seeing the boy going out, finished his matter presently with John of London's amen, saying, ha ye faith, boy! are they there? Then ha with thee, and so came downe and among them he goes."[165:A]

That the music of the _bag-pipe_ was highly esteemed in the days of Shakspeare, and even preferred to the tabor and pipe, we have a strong instance in his _Winter's Tale_, where a servant enters announcing Autolicus in the following terms: "If you did but hear the pedlar at the door, you would never dance again after a tabor and pipe; no, _the bag-pipe could not move you_[165:B];" and that especially in the country, it was a frequent accompaniment to the morris bells, the numerous collections of _madrigals_, published in the sixteenth and seventeenth centuries, afford many proofs. Thus, from a collection printed in 1600:

"Harke, harke, I heare the dancing And a nimble morris prancing; _The bagpipe and the morris bells_, That they are not farre hence us tells; Come let us all goe thither, And dance like friends together:"[165:C]

and from another, allusive to the May-games, edited by Thomas Morley:

"Now is the month of Maying, When merry lads are playing; Fa la la, Each with his bonny lasse, Upon the greeny grasse. Fa la la.

The spring clad all in gladness, Doth laugh at winter's sadnesse; And to the _bagpipe's_ sound, The nimphs tread out their ground.

* * * * *

About the May-pole new with glee and merriment, While as the _bagpipe_ tooted it, Thirsis and Cloe fine together footed it; Fa la la."[166:A]

The Morris and the May-game of Robin Hood attained their most perfect form when united with the _Hobby-Horse_ and the _Dragon_. Of these the former was the resemblance of the head and tail of a horse, manufactured in pasteboard, and attached to a person whose business it was, whilst he seemed to ride gracefully on its back, to imitate the prancings and curvettings of that noble animal, whose supposed feet were concealed by a foot-cloth reaching to the ground; and the latter, constructed of the same materials, was made to hiss and vibrate his wings, and was frequently attacked by the man on the hobby-horse, who then personated the character of St. George.[166:B]

In the reigns therefore of Elizabeth and James I. these eight masqueraders, consisting of _Robin Hood_, _Maid Marian_, _Friar Tuck_, _Little John_, the _Fool_, _Tom the Piper_, the _Hobby-Horse_, and the _Dragon_, with from two to ten _morris-dancers_, or, in lieu of them, the same number of _Robin Hood's men_, in coats, hoods, and hose of green, with a painted _pole_ in the centre, represented the most complete establishment of the May-game.[167:A]

All these characters may be traced, indeed, so far back as the middle of the fifteenth century; and, accordingly, Mr. Strutt, in his interesting romance, entitled "Queen-hoo Hall," has introduced a very pleasing and accurate description of the May-games and Morris of Robin Hood, which, as written in a lively and dramatic style, and not in the least differing from what they continued to be in the youthful days of Shakspeare, and before they were broken in upon by the fanaticism of the puritans, we shall copy in this place for the entertainment of our readers.

"In the front of the pavilion, a large square was staked out, and fenced with ropes, to prevent the crowd from pressing upon the performers, and interrupting the diversion; there were also two bars at the bottom of the inclosure, through which the actors might pass and repass, as occasion required.

"Six young men first entered the square, clothed in jerkins of leather, with axes upon their shoulders like woodmen, and their heads bound with large garlands of ivy-leaves intertwined with sprigs of hawthorn. Then followed,

"Six young maidens of the village, dressed in blue kirtles, with garlands of primroses on their heads, leading a fine sleek cow, decorated with ribbons of various colours, interspersed with flowers; and the horns of the animal were tipped with gold. These were succeeded by

"Six foresters, equipped in green tunics, with hoods and hosen of the same colour; each of them carried a bugle-horn attached to a baldrick of silk, which he sounded as he passed the barrier. After them came

"Peter Lanaret, the baron's chief falconer, who personified _Robin Hood_; he was attired in a bright grass-green tunic, fringed with gold; his hood and his hosen were parti-coloured, blue and white; he had a large garland of rose-buds on his head, a bow bent in his hand, a sheaf of arrows at his girdle, and a bugle-horn depending from a baldrick of light blue tarantine, embroidered with silver; he had also a sword and a dagger, the hilts of both being richly embossed with gold.

"Fabian a page, as _Little John_, walked at his right hand; and Cecil Cellerman the butler, as Will Stukely, at his left. These, with ten others of the jolly outlaw's attendants who followed, were habited in green garments, bearing their bows bent in their hands, and their arrows in their girdles. Then came

"Two maidens, in orange-coloured kirtles with white[168:A] courtpies; strewing flowers; followed immediately by

"The _maid Marian_, elegantly habited in a watchet-coloured[168:B] tunic reaching to the ground; over which she wore a white linen[168:C] rochet with loose sleeves, fringed with silver, and very neatly plaited; her girdle was of silver baudekin[168:D], fastened with a double bow on the left side; her long flaxen hair was divided into many ringlets, and flowed upon her shoulders; the top part of her head was covered with a net-work cawl of gold, upon which was placed a garland of silver, ornamented with blue violets. She was supported by

"Two bride-maidens, in sky-coloured rochets girt with crimsom girdles, wearing garlands upon their heads of blue and white violets. After them, came

"Four other females in green courtpies, and garlands of violets and cowslips: Then

"Sampson the smith, as _Friar Tuck_, carrying a huge quarter-staff on his shoulder; and Morris the mole-taker, who represented Much the miller's son, having a long pole with an inflated bladder attached to one end[169:A]: And after them

"The _May-pole_, drawn by eight fine oxen, decorated with scarfs, ribbons, and flowers of divers colours; and the tips of their horns were embellished with gold. The rear was closed by

"The _Hobby-horse_ and the _Dragon_.

"When the May-pole was drawn into the square, the foresters sounded their horns, and the populace expressed their pleasure by shouting incessantly untill it reached the place assigned for its elevation:—and during the time the ground was preparing for its reception, the barriers of the bottom of the inclosure were opened for the villagers to approach, and adorn it with ribbons, garlands, and flowers, as their inclination prompted them.

"The pole being sufficiently onerated with finery, the square was cleared from such as had no part to perform in the pageant; and then it was elevated amidst the reiterated acclamations of the spectators. The woodmen and the milk-maidens danced around it according to the rustic fashion; the measure was played by Peretto Cheveritte, the baron's chief minstrel, on the bagpipes accompanied with the pipe and labour, performed by one of his associates. When the dance was finished, Gregory the jester, who undertook to play the hobby-horse, came forward with his appropriate equipment, and, frisking up and down the square without restriction, imitated the galloping, curvetting, ambling, trotting, and other paces of a horse, to the infinite satisfaction of the lower classes of the [170:A]spectators. He was followed by Peter Parker, the baron's ranger, who personated a dragon, hissing, yelling, and shaking his wings with wonderful ingenuity; and to complete the mirth, Morris, in the character of Much, having small bells attached to his knees and elbows, capered here and there between the two monsters in the form of a dance; and as often as he came near to the sides of the inclosure, he cast slily a handful of meal into the faces of the gaping rustics, or rapped them about their heads with the bladder tied at the end of his [170:B]pole. In the mean time, Sampson, representing Friar Tuck, walked with much gravity around the square, and occasionally let fall his heavy staff upon the toes of such of the crowd as he thought were approaching more forward than they ought to do; and if the sufferers cried out from the sense of pain, he addressed them in a solemn tone of voice, advising them to count their beads, say a paternoster or two, and to beware of purgatory. These vagaries were highly palatable to the populace, who announced their delight by repeated plaudits and loud bursts of laughter; for this reason they were continued for a considerable length of time: but Gregory, beginning at last to faulter in his paces, ordered the dragon to fall back: the well-nurtured beast, being out of breath, readily obeyed, and their two companions followed their example; which concluded this part of the pastime.

"Then the archers set up a target at the lower part of the Green, and made trial of their skill in a regular succession. Robin Hood and Will Stukely excelled their comrades: and both of them lodged an arrow in the centre circle of gold, so near to each other that the difference could not readily be decided, which occasioned them to shoot again; when Robin struck the gold a second time, and Stukely's arrow was affixed upon the edge of it. Robin was therefore adjudged the conqueror; and the prize of honour, a garland of laurel embellished with variegated ribbons, was put upon his head; and to Stukely was given a garland of ivy, because he was the second best performer in that contest.

"The pageant was finished with the archery; and the procession began to move away, to make room for the villagers, who afterwards assembled in the square, and amused themselves by dancing round the May-pole in promiscuous companies, according to the ancient custom."[171:A]

In consequence of the opposition, however, of the puritans, during the close of Elizabeth's reign, who considered the rights of May-day as relics of paganism, much havoc was made among the Dramatis Personæ of this festivity. Sometimes instead of Robin and Marian, only a Lord or Lady of the day was adopted; frequently the friar was not suffered to appear, and still more frequently was the hobby-horse interdicted. This zealous interference of the sectarists was ridiculed by the poets of the day, and among the rest by Shakspeare, who quotes a line from a satirical ballad on this subject, and represents Hamlet as terming it an epitaph; "Else shall he suffer not thinking on," says he, "with the hobby-horse; whose epitaph is, _For, O, for, O, the hobby horse is forgot_."[171:B] He has the same allusion in Love's Labour's Lost[171:C]; and Ben Jonson has still more explicitly noticed the neglect into which this character in the May-games had fallen in his days.

"But see, the Hobby-horse is forgot. Foole, it must be your lot, To supply his want with faces, And some other Buffon graces;"[172:A]

and again, still more pointedly,—

"_Clo._ They should be Morris dancers by their gingle, but they have no napkins.

Coc. No, nor a hobby-horse.

Clo. Oh, he's _often forgotten_, that's no rule; but there is no maid Marian nor Friar amongst them, which is the surer mark.

Coc. Nor a Foole that I see."[172:B]

In Beaumont and Fletcher's Tragi-comedy called _Women Pleased_, the aversion of the puritans to this festive beast is strikingly depicted; where the person who was destined to perform the hobby-horse, being converted by his wife, exclaims vehemently against the task imposed upon him.

"_Hob._

I do defie thee and thy foot-cloth too, And tell thee to thy face, this prophane riding I feel it in my conscience, and I dare speak it, This unedified ambling hath brought a scourge upon us.—

Far.

Will you dance no more, neighbour?

Hob.

Surely no, Carry the beast to his crib: I have renounc'd him And all his works.

Soto.

Shall the Hobby-horse be forgot then? The hopeful Hobby-horse, shall he lye founder'd?

Hob.

I cry out on't, 'Twas the forerunning sin brought in those tilt-staves, They brandish 'gainst the church, the Devil calls _May poles_."[173:A]

From one of these puritans, named Stephen Gosson, we learn, likewise, that Morrice-dancers and Hobby-horses had been introduced even upon the stage during the early part of the reign of Elizabeth; for this writer, in a tract published about 1579, and entitled _Plays Confuted_, says, that "the Devil beeside the beautie of the houses, and the stages, sendeth in gearish apparell, maskes, ranting, tumbling, dauncing of gigges, galiardes, _morisces_, _hobbi-horses_, &c."[173:B] By the continued railings and invectives, however, of these fanatics, the May-games were, at length, so broken in upon, that had it not been for the _Book of Sports, or lawful Recreations upon Sunday after Evening-prayers, and upon Holy-days_, issued by King James in 1618, they would have been totally extinct. This curious volume permitted May-games, Morris-dances, Whitsun-ales, the setting up of May-poles, &c.[173:C]; and had it not allowed church-ales, and dancing on the Sabbath, would have been unexceptionable in its tendency; for

as honest Burton observes, in allusion to this very _Declaration_ of King James, "_Dancing_, _Singing_, _Masking_, _Mumming_, _Stage-playes_, howsoever they be heavily censured by some severe _Catoes_, yet if _opportunely_ and _soberly used_, may justly be approved. _Melius est fodere, quam saltare_, saith _Augustin_: but what is that if they delight in it? _Nemo saltat sobrius._ But in what kind of dance? I know these sports have many oppugners, whole volumes writ against them; when as all they say (if duly considered) is but _ignoratio Elenchi_; and some again, because they are now cold and wayward, past themselves, cavil at all such youthful sports in others, as he did in the Comedy; they think them, _illico nasci senes_, &c. Some out of preposterous zeal object many times trivial arguments, and because of some abuse, will quite take away the good use, as if they should forbid wine, because it makes men drunk; but in my judgment they are too stern: there _is a time for all things, a time to mourn, a time to dance_. Eccles. 3. 4. _a time to embrace, a time not to embrace_, (ver. 5.) _and nothing better than that a man should rejoice in his own works_, ver. 22. For my part, I will subscribe to the _King's Declaration_, and was ever of that mind, those _May-games_, _Wakes_, and _Whitsun-ales_, &c. if they be not at _unseasonable_ hours, may justly be permitted. Let them freely feast, sing and dance, have their _poppet-playes_, _hobby-horses_, _tabers_, _crouds_, _bag-pipes_, &c., play at _ball_, and _barley-brakes_, and what sports and recreations they like best."[174:A] All these festivities, however, on _May-day_, were again set aside, by still greater enthusiasts, during the period of the Commonwealth, and were once more revived at the Restoration; at present, few vestiges remain either of those ancient rites, or of those attendant on other popular periodical festivals.[174:B]

Several of the amusements, and some of the characters attendant on the celebration of May-day, were again introduced at WHITSUNTIDE, especially the morris-dance, which was as customary on this period of festivity as on the one immediately preceding it. Thus Shakspeare, in King Henry V., makes the Dauphin say, alluding to the youthful follies of the English monarch,

————— "Let us do it with no show of fear; No, with no more, than if we heard that England Were busied with a _Whitsun Morris-dance_."[175:A]

The rural sports and feasting at Whitsuntide were usually designated by the term _Whitsun-ales_; _ale_ being in the time of Shakspeare, and for a century or two, indeed, before him, synonymous with _festival_ or _merry-making_. Chaucer and the author of Pierce Plowman use the word repeatedly in this sense, and the following passages from our great poet, from Jonson, and from Ascham, prove that it was familiar, in their time, in the sense of simple carousing, church-feasting, and Whitsuntide recreation. Launcelot, in the _Two Gentlemen of Verona_, exclaims to Speed, "Thou hast not so much charity in thee, as to go to the _ale_ with a Christian[175:B];" and Ascham, speaking of the conduct of husbandmen, in his Toxophilus, observes that those which have their dinner and drink in the field, "have fatter barnes in the harvest, than they which will either sleape at noonetyme of the day, or els _make merye with theyr neighbours at the ale_."[175:C] In the chorus to the first act of _Pericles_, it is recorded of an old song, that

"It hath been sung at festivals, On ember-eves, and _holy-ales_."[176:A]

And Jonson says,

—— "All the neighbourhood, from old records Of antique proverbs drawn from _Whitson lords_, And their authorities at wakes and _ales_, With country precedents, and old wives tales, We bring you now."[176:B]

It will be necessary, in this place, therefore, to notice briefly, as being periods of festivity, the various _Ales_ which were observed by our ancestors in the sixteenth century. They may be enumerated under the heads of _Leet-ale_, _Lamb-ale_, _Bride-ale_, _Clerk-ale_, _Church-ale_ and _Whitsun-ale_. We shall confine our attention at present, however, principally to the two latter; for of the Lamb-ale and Bride-ale, an occasion will occur to speak more at large in a subsequent part of this chapter, and a very few words will suffice with regard to the Leet-ale and the Clerk-ale; the former being merely the dinner provided for the jury and customary tenants at the court-leet of a manor, or _View of frank pledge_, formerly held once or twice a year, before the steward of the leet[176:C]; to this court Shakspeare alludes, in his _Taming of the Shrew_, where the servant tells Sly, that in his dream he would "rail upon the hostess of the house," and threaten to

—— —— "present her at the leet:"[176:D]

and the latter, which usually took place at Easter, is thus mentioned by Aubrey in his manuscript History of Wiltshire. "In the Easter holidays was the _Clarkes-Ale_, for his private benefit and the solace of the neighbourhood."[176:E]

The _Church-ale_ was a festival instituted sometimes in honour of the church-saint, but more frequently for the purpose of contributing towards the repair or decoration of the church. On this occasion it was the business of the churchwardens to brew a

considerable quantity of strong ale, which was sold to the populace in the church-yard, and to the better sort in the church itself, a practice which, independent of the profit arising from the sale of the liquor, led to great pecuniary advantages; for the rich thought it a meritorious duty, beside paying for their ale, to offer largely to the holy fund. It was no uncommon thing indeed to have four, six, or eight of these _ales_ yearly, and sometimes one or more parishes _agreed_ to hold annually a _certain number_ of these meetings, and to contribute individually a _certain sum_. Of this a very curious proof may be drawn from the following stipulation, preserved in Dodsworth's Manuscripts in the Bodleian Library:—"The parishioners of Elveston and Okebrook, in Derbyshire, agree jointly, to brew four _Ales_, and every _Ale_ of one quarter of malt, betwixt this (the time of contract) and the feast of saint John Baptist next coming. And that every inhabitant of the said town of Okebrook shall be at the several _Ales_. And every husband and his wife shall pay two pence, and every cottager one penny, and all the inhabitants of Elveston shall have and receive all the profits and advantages coming of the said _Ales_, to the use and behoof of the said church of Elveston. And the inhabitants of Elveston shall brew _eight Ales_ betwixt this and the feast of saint John Baptist, at the which _Ales_ the inhabitants of Okebrook shall come and pay as before rehersed. And if he be away at one _Ale_, to pay at the toder Ale for both, &c."[177:A]

The date of this document is anterior to the Reformation, but that _church-ales_ were equally popular and frequent in the days of Shakspeare will be evident from the subsequent passages in Carew and Philip Stubbes. The historian of Cornwall, whose work was first printed in 1602, says that "for the church-ale, two young men of the parish are yerely chosen by their last foregoers, to be wardens; who, dividing the task, make collection among the parishioners, of what soever provision it pleaseth them voluntarily to bestow. This they imploy in brewing, baking, and other acates, against Whitsontide; upon which holy-dayes the neighbours meet at the church-house, and there merily feede on their owne victuals, contributing some petty portion to the stock; which, by many smalls, groweth to a meetley greatness: for there is entertayned a kinde of emulation betweene these wardens, who by his graciousness in gathering, and good husbandry in expending, can best advance the churches profit. Besides, the neighbour parishes at those times lovingly visit one another, and this way frankely spend their money together. The afternoones are consumed in such exercises as olde and yong folke (having leysure) doe accustomably weare out the time withall."[178:A] Stubbes in his violent philippic declares that, "in certaine townes, where drunken Bacchus bears swaie against Christmas and Easter, Whitsunday, or some other time, the churchwardens, for so they call them, of every parish, with the consent of the whole parish, provide half a score or twentie quarters of mault, whereof some they buy of the church stocke, and some is given to them of the parishioners themselves, every one conferring somewhat, according to his ability; which mault being made into very strong ale, or beer, is set to sale, either in the church or in some other place assigned to that purpose. Then, when this nippitatum, this huffe-cappe, as they call it, this nectar of life, is set abroach, well is he that can get the soonest to it, and spends the most at it, for he is counted the godliest man of all the rest, and most in God's favour, because it is spent upon his church forsooth."[178:B]

There is but too much reason to suppose that the satire of this bitter writer was not, in this instance, ill directed, and that meetings of this description, though avowedly for the express benefit of the church, were often productive of licentiousness, and consequently highly injurious both to morals and religion. A few lines from Ben Jonson will probably place this beyond doubt. In his Masque of Queens, performed at Whitehall, 1609, he represents one of his witches as exclaiming

"I had a dagger: what did I with that? Kill'd an infant, to have his fat: A Piper it got, at a _Church-ale_."[179:A]

Returning to the consideration of the _Whitsuntide_ amusements, it may be observed, that not only was the morris a constituent part in their celebration, but that the Maid Marian of the May-games was frequently introduced: thus Shirley represents one of his characters exclaiming against rural diversions in the following manner:

——— "Observe with what solemnity They keep their wakes, and throw for pewter candlestickes, How they become the morris, with whose bells They ring all into _Whitson ales_, and sweate Through twentie scarffes and napkins, till the Hobby-horse Tire, and the _maide Marrian_ dissolv'd to a gelly, Be kept for spoone meate."[179:B]

The festivities, indeed, on this occasion, as at those on May-day, were often regulated by a Lord and Lady of the _Whitsun-ales_.[179:C] Very frequently, however, there was elected only a Lord of Misrule, and as the church or holy ales were not unfrequently combined with the merriments of this season, the church-yard, especially on the sabbath-day, was too generally the scene of rejoicing. The severity of Stubbes, when censuring this profanation of consecrated ground, will scarcely be deemed too keen: "First," says he, "all the wilde heads of the parish, flocking together, chuse them a graund captaine (of mischiefe) whom they inrolle with the title of _my Lord of misrule_, and him they crowne with great solemnitie, and adopt for their king. This king annoynted, chooseth foorth twentie, fourtie, threescore, or a hundred lustie guttes like to himselfe to wait upon his lordly majesty, and to guarde his noble person.—(Here he describes the dress of the morris dancers, as quoted in a former page, and proceeds as

follows.) Thus all things set in order, then have they their hobby-horses, their dragons and other antiques, together with their baudie pipers, and thundering drummers, to strike up the _Devils Daunce_ withall: then martch this heathen company towards the church and church-yarde, their pypers pypyng, their drummers thundering, their stumpes dauncing, their belles jyngling, their handkercheefes fluttering about their heads like madde men, their hobbie horses, and other monsters skirmishing amongst the throng: and in this sorte they goe to the church like Devils incarnate, with such a confused noise, that no man can heare his owne voyce. Then the foolish people they looke, they stare, they laugh, they fleere, and mount upon formes and pewes, to see these goodly pageants solemnized in this sort. Then after this about the church they goe againe and againe, and so foorth into the church yard, where they have commonly their summer haules, their bowers, arbours, and banqetting houses set up, wherein they feast, banquet, and daunce all that day, and (peradventure) all that night too. And thus these terrestrial furies spend the Sabboth day. Another sort of fantastical fooles bring to these helhoundes (the Lord of misrule and his complices) some bread, some good ale, some new cheese, some old cheese, some custardes, some cracknels, some cakes, some flaunes, some tartes, some creame, some meat, some one thing, some another; but if they knewe that as often as they bringe anye to the maintenance of these execrable pastimes, they offer sacrifice to the Devill and Sathanas, they would repente and with drawe their handes, which God graunt they may."[180:A]

Dramatic exhibitions, called _Whitsun plays_, were common, at this season, both in town and country, and in the latter they were chiefly of a pastoral character. Shakspeare has an allusion to them in his _Winter's Tale_, where Perdita, addressing Florizel, says,

——————— "Come, take your flowers: Methinks, I play as I have seen them do in _Whitsun' pastorals_."[181:A]

Soon after Whitsuntide began the season of sheep-shearing, which was generally terminated about midsummer, and either at its commencement or close, was distinguished by the LAMB-ALE or SHEEP-SHEARING FEAST. At Kidlington in Oxfordshire, it seems to have been _ushered in_ by ceremonies of a peculiar kind, for, according to Blount, "the Monday after the Whitsun week, a fat lamb was provided, and the maidens of the town, having their thumbs tied behind them, were permitted to run after it, and she who with her mouth took hold of the lamb was declared the Lady of the Lamb, which, being killed and cleaned, but with the skin hanging upon it, was carried on a long pole before the lady and her companions to the green, attended with music, and a morisco dance of men, and another of women. The rest of the day was spent in mirth and merry glee. Next day the lamb, partly baked, partly boiled, and partly roasted, was served up for the lady's feast, where she sat, majestically at the upper end of the table, and her companions with her, the music playing during the repast, which, being finished, the solemnity ended."[181:B]

The most usual mode, however, of celebrating this important period was by a dinner, music, with songs, and the election of a Shepherd King, an office always conferred upon the individual whose flock had produced the earliest lamb. The dinner is thus enjoined by the rustic muse of Tusser:—

"Wife make us a dinner, spare flesh neither corne, Make wafers and cakes, for our sheepe must be shorne, At sheep-shearing, neighbours none other things crave, But good cheare and welcome, like neighbours to have."[182:A]

But it is from Drayton that we derive the most minute account of the festival; who in the fourteenth song of his Poly-Olbion, and still more at large in his ninth Eclogue, has given a most pleasing picture of this rural holy-day:—

"When the new-wash'd flock from the river's side, Coming as white as January's snow, The ram with nosegays bears his horns in pride, And no less brave the bell-wether doth go.

After their fair flocks in a lusty rout, Come the gay swains with bag-pipes strongly blown, And busied, though this solemn sport about, Yet had each one an eye unto his own.

And by the ancient statutes of the field, He that his flocks the earliest lamb should bring, (As it fell out then, Rowland's charge to yield) Always for that year was the shepherd's king.

And soon preparing for the shepherd's board, Upon a green that curiously was squar'd, With country cates being plentifully stor'd: And 'gainst their coming handsomely prepar'd.

New whig, with water from the clearest stream, Green plumbs, and wildings, cherries chief of feast, Fresh cheese, and dowsets, curds, and clouted cream, Spic'd syllibubs, and cyder of the best:

And to the same down solemnly they sit, In the fresh shadow of their summer bowers, With sundry sweets them every way to fit, The neighb'ring vale despoiled of her flowers.—

When now, at last, as lik'd the shepherd's king, (At whose command they all obedient were) Was pointed, who the roundelay should sing, And who again the under-song should bear."[183:A]

Shakspeare also, in his _Winter's Tale_, has presented us not only with a list of the good things necessary for a sheep-shearing feast, but he describes likewise the attentions which were due, on this occasion, from the hostess, or Shepherd's Queen.

"Let me see," says the Clown, "what I am to buy for our sheep-shearing feast? _Three pound of sugar; five pound of currants; rice_——What will this sister of mine do with rice? But my father hath made her mistress of the feast, and _she lays it on_. She hath made me four-and-twenty nosegays for the shearers: three-man song-men all[183:B], and very good ones; but they are most of them means[183:C] and bases: but one Puritan amongst them, and he sings psalms to horn-pipes. I must have _saffron_, to colour the _warden pies_; mace,—dates,—none; that's out of my note: _nutmegs, seven_; _a race, or two, of ginger_: but that I may beg;—_four pound of prunes, and as many of raisins o' the sun_."[183:D]

The culinary articles in this detail are somewhat more expensive than those enumerated by Drayton; and Mr. Steevens, in a note on this passage of the Winter's Tale, observes that "the expence attending these festivities, appears to have afforded matter of complaint. Thus, in _Questions of profitable and pleasant Concernings_, &c. 1594: 'If it be a _sheep-shearing feast_, maister Baily can entertaine you with his bill of reckonings to his maister of three sheapheard's wages, spent on _fresh cates_, besides _spices_ and _saffron pottage_."[183:E]

The shepherd's reproof to his adopted daughter, Perdita, as Polixenes remarks,

——— "the prettiest low-born lass, that ever Ran on the green-sward,"

implies indirectly the duties which were expected by the peasants, on this day, from their rural queen, and which seems to have been sufficiently numerous and laborious:—

"Fye, daughter, when my old wife liv'd, upon This day, she was both pantler, butler, cook; Both dame and servant: welcom'd all; serv'd all: Would sing her song, and dance her turn: now here, At upper end o'the table, now, ithe middle; On his shoulder, and his: her face o'fire With labour; and the thing, she took to quench it, She would to each one sip: You are retir'd, As if you were a feasted one, and not The hostess of the meeting: Pray you, bid These unknown friends to us welcome: for it is A way to make us better friends, more known. Come, quench your blushes; and present yourself That which you are, mistress o'the feast: Come on, And bid us welcome to your _sheep-shearing_, As your good flock shall prosper."[184:A]

It should be remarked that one material part of this welcome appears, from the context, to have consisted in the distribution of various flowers, suited to the ages of the respective visitors, a ceremony which was, probably, customary at this season of rejoicing.

"_Perdita._ Give me those flowers there, Dorcas.—Reverend sirs, For you there's rosemary, and rue; these keep Seeming, and savour, all the winter long: Grace, and remembrance, be to you both, And welcome to our shearing!——— ——————————— Here's flowers for you; Hot lavender, mints, savory, marjoram; The marigold, that goes to bed with the sun, And with him rises weeping; these are flowers Of middle summer, and, I think, they are given To men of middle age: You are very welcome.— ———— ———— ——— Now, my fairest friend, I would, I had some flowers of the spring, that might Become your time of day; and yours, and yours; That wear upon your virgin branches yet Your maidenheads growing:—O, these I lack, To make you garlands of."[185:A]

A custom somewhat allied to this, that of scattering flowers on the streams at _shearing time_, has been long observed in the south-west of England, and is thus alluded to as an ancient rite by Dyer, in his beautifully descriptive poem entitled _The Fleece_:

——— "With light fantastic toe, the nymphs Thither assembled, thither ev'ry swain; And o'er the dimpled stream a thousand flowers, Pale lilies, roses, violets and pinks, Mixt with the greens of burnet, mint and thyme, And trefoil, sprinkled with their sportive arms. Such custom holds along the irriguous vales, From Wreakin's brow to rocky Dolvoryn, Sabrina's early haunt."[185:B]

That one of the principal seasons of rejoicing should take place on securely collecting the fruits of the field, it is natural to expect; and accordingly, in almost every country, a HARVEST-HOME, or Feast, has been observed on this occasion.

Much of the festivity and jocular freedom however, which subsisted formerly at this period, has been worn away by the increasing refinements and distinctions of society. In the sixteenth and seventeenth centuries, and, indeed, during a part of the eighteenth, the

Harvest, or _Mell_, Supper, as it was sometimes called, from the French word _Mesler_, to mingle or mix together, was a scene not only remarkable for merriment and hospitality, but for a temporary suspension of all inequality between master and man. The whole family sate down at the same table, and conversed, danced, and sang together during the entire night without difference or distinction of any kind; and, in many places indeed, this freedom of manner subsisted during the whole period of getting in the Harvest. Thus Tusser, recommending the social equality of the Harvest-tide, exclaims,

"In harvest time, harvest folke, _servants and al_, should make _altogither_, good cheere in the hal: And fil out the blacke bol, of bleith to their song, and let them be merrie, _al harvest time long_."[186:A]

Of this ancient convivial licence, a modern rural poet has drawn a most pleasing picture, lamenting, at the same time, that the Harvest-Feast of the present day is but the phantom of what it was:—

"The aspect only with the substance gone.

* * * * *

Behold the sound oak table's massy frame Bestride the kitchen floor! the careful dame And gen'rous host invite their friends around, _While all that clear'd the crop, or till'd the ground, Are guests by right of custom:—— Here once a year Distinction low'rs its crest, The master, servant, and the merry guest, Are equal all_; and round the happy ring The reaper's eyes exulting glances fling, And, warm'd with gratitude, he quits his place, With sun-burnt hands and ale-enliven'd face, Refills the jug his honour'd host to tend, To serve at once the master and the friend; Proud thus to meet his smiles, to share his tale, His nuts, his conversation, and his ale. _Such were the days,——of days long past I sing._"[186:B]

It will be necessary to enter a little more minutely into the rites and ceremonies which accompanied this annual feast in the days of Shakspeare, and fortunately we can appeal to a few curious documents on which dependence can be placed. Hentzner, a learned German who travelled through Germany, England, France, and Italy, towards the close of the sixteenth century, and whose Itinerary, as far as it relates to this country, has been translated by the late Lord Orford, says, "as we were returning to our inn (from Windsor), we happened to meet some country people _celebrating their harvest-home_; their last load of corn they crown with flowers, having besides an image richly dressed, by which, perhaps, they would signify Ceres; this they keep moving about, while men and women, men and maid servants, riding through the streets in the cart, shout as loud as they can till they arrive at the barn."[187:A] Dr. Moresin also, another foreigner, who published, in the reign of James I., an elaborate work on the "Origin and Increase of Depravity in Religion," relates that he saw "in England the country people bringing home, in a cart from the harvest field, a figure made of corn, round which men and women were promiscuously singing, preceded by a piper and a drum."[187:B]

To this custom of accompanying home the last waggon-load of corn, at the close of harvest, with music, Shakspeare is supposed to allude in the _Merchant of Venice_, where Lorenzo tells the musicians to pierce his mistress' ear with sweetest touches,

"And draw her home with musick."[187:C]

It was usual also, not only to feast the men and women, but to reward likewise the boys and girls who were in any degree instrumental in getting in the harvest; accordingly Tusser humanely observes,

"Once ended thy harvest, let none be begilde, please such as did please thee, man, woman and _child_: Thus doing, with alwaie such helpe as they can, thou winnest the praise, of the labouring man;"[188:A]

an injunction which Mr. Hilman has further explained by subjoining to this stanza the following remark:—"Every one," says he, "that did any thing towards the Inning, must now have some reward, as ribbons, laces, rows of pins to boys and girls, if never so small, for their encouragement, and to be sure plumb-pudding."

The most minute account, however, which we can now any where meet with, of the ceremonies and rejoicings at Harvest-Home, as they existed during the prior part of the seventeenth century, and which we may justly consider as not deviating from those that accompanied the same festival in the reign of Elizabeth, is to be found among the poems of Robert Herrick, and will be valued, not exclusively for its striking illustration of the subject, but for its merit, likewise, as a descriptive piece.

"THE HOCK-CART, OR HARVEST-HOME.[188:B]

COME, Sons of Summer, by whose toile We are the Lords of wine and oile: By whose tough labours, and rough hands, We rip up first, then reap our lands. Crown'd with the eares of corne, now come, And, to the pipe, sing Harvest-home. Come forth, my Lord, and see the cart Drest up with all the country art. See, here a _Maukin_, there a sheet, As spotlesse pure, as it is sweet: The horses, mares, and frisking fillies, Clad, all, in linnen, white as lillies. The Harvest swaines, and wenches bound For joy, to see the _Hock-cart_ crown'd. About the cart, heare, how the rout Of rurall younglings raise the shout; Pressing before, some coming after, These with a shout, and these with laughter. Some blesse the cart; some kisse the sheaves; Some prank them up with oaken leaves: Some crosse the fill-horse; some with great Devotion, stroak the home-borne wheat: While other rusticks, lesse attent To prayers, then to merryment, Run after with their breeches rent. Well, on, brave boyes, to your Lord's hearth, Glitt'ring with fire; where, for your mirth, Ye shall see first the large and cheefe Foundation of your feast, fat beefe: With upper stories, mutton, veale And bacon, which makes full the meale; With sev'ral dishes standing by, As here a custard, there a pie, And here all tempting frumentie. And for to make the merry cheere, If smirking wine be wanting here, There's that, which drowns all care, stout beere; Which freely drink to your Lord's health, Then to the plough, the commonwealth; Next to your flailes, your fanes, your fats; Then to the maids with wheaten hats; To the rough sickle, and crookt sythe, Drink frollick boyes, till all be blythe. Feed, and grow fat; and as ye eat, Be mindfull, that the lab'ring neat, As you, may have their fill of meat. And know, besides, ye must revoke The patient oxe unto the yoke, And all goe back unto the plough And harrow, though they're hang'd up now. And, you must know, your Lord's word true, Feed him ye must, whose food fils you. And that this pleasure is like raine, Not sent ye for to drowne your paine, But for to make it spring againe."[189:A]

We must not forget that, during the reign of Elizabeth, another _feast-day_ fell to the lot of the husbandman, at the close of wheat-sowing, in October. This was termed, from one of the chief articles provided for the table, THE SEED-CAKE, and is no where recorded so distinctly as by the agricultural muse of Tusser:—

"Wife sometime this week, if the weather hold cleer, an end of wheat-sowing, we make for this yeere: Remember thou therefore, though I do it not, the _seed-cake_, the _pastries_, and _furmenty pot_."[190:A]

Proceeding with the year, and postponing the consideration of All Hallowmas to the chapter on superstitions, we reach the eleventh of November, or the festival of St. Martin, usually called MARTINMAS, or MARTLEMAS, a day formerly devoted to feasting and conviviality, and on which a stock of salted provisions was laid in for the winter. This custom of killing cattle, swine, &c. and _curing_ them against the approaching season, was, during the sixteenth and seventeenth centuries, common every where, though _now_ only partially observed in a few country-villages; for smoke-dryed meat in those days was more generally relished than at present. We find Tusser, therefore, as might be expected, recommending this savoury diet; in one place saying to his farmer,—

"For Easter, at _Martilmas_, hang up a beefe— With that and the like, yer grasse beef come in, thy folke shall look cheerely, when others look thin;"[190:B]

and again,—

"_Martilmas_ beefe doth bear good tacke, When countrey folke do dainties lacke;"[190:C]

so, likewise, in _The Pinner of Wakefield_, printed in 1559,

"A piece of beef hung up since _Martlemas_."

Moresin tells us, in the reign of James I., that there were great rejoicings and feasting on this day throughout Europe, an assertion which is verified by the ancient Calendar of the church of Rome, where under the eleventh of November occur the following observations:—"Martinalia, Geniale Festum. Vina delibantur et defecantur. Vinalia veterum festum huc translatum. Bacchus in Martini figura.—The Martinalia, a genial feast. Wines are tasted of and drawn from the lees. The Vinalia, a feast of the Antients, removed to this day. Bacchus in the figure of Martin."[191:A] J. Boëmus Aubanus likewise informs us, as Mr. Brand remarks, "that in Franconia, there was a great deal of eating and drinking at this season; no one was so poor or niggardly that on the _Feast of St. Martin_ had not his dish of the _entrails_ either of _oxen_, _swine_, or _calves_. They drank, too, he says, very liberally of _wine_ on the occasion."[191:B]

In this country, merriment and good cheer were equally conspicuous on St. Martin's feast; the young danced and sang, and the old regaled themselves by the fire-side. A modern poet, who has beautifully copied the antique, under the somewhat stale pretence of discovering an ancient manuscript, presents us with a specimen of his manufacture of considerable merit, under the title of

Martilmasse Daye; this, as being referred to the age of Elizabeth, and recording, with due attention to historical costume, the mirth and revelry which used formerly to distinguish this period, may be admitted here as a species of traditional evidence of no exceptionable kind. The poem, which is supposed to have been found at Norwich, at an ancient Hostelrie, whilst under repair, consists of six stanzas, two of which, however, though possessing poetical and descriptive point, we have omitted, as not referable to any peculiar observance of the day:—

"It is the day of Martilmasse, Cuppes of ale should freelie passe; What though Wynter has begunne To push downe the summer sunne, To our fire we can betake And enjoie the cracklinge brake, Never heedinge winter's face On the day of Martilmasse.—

Some do the citie now frequent, Where costlie shews and merriment Do weare the vaporish ev'ninge out With interlude and revellinge rout; Such as did pleasure Englandes Queene, When here her royal Grace was seene,[192:A] Yet will they not this day let passe, The merrie day of Martilmasse.

Nel hath left her wool at home, The Flanderkin hath stayed his loom,[192:B] No beame doth swinge nor wheel go round Upon Gurguntums walled ground;[192:C] Where now no anchorite doth dwell To rise and pray at Lenard's bell: Martyn hath kicked at Balaam's ass, So merrie be old Martilmasse.

When the dailie sportes be done, Round the market crosse they runne, Prentis laddes, and gallant blades, Dancinge with their gamesome maids, Till the beadel, stoute and sowre, Shakes his bell, and calls the houre; Then farewell ladde and farewell lasse, To' th' merry night of Martilmasse."[193:A]

Shakspeare has an allusion to this formerly convivial day in the _Second Part of King Henry IV._, where Poins, asking Bardolph after Falstaff, says: "How doth the _martlemas_, your master?" an epithet by which, as Johnson observes, he means the latter spring, or the old fellow with juvenile passions.[193:B]

We have now to record the closing and certainly the greatest festival of the year, the celebration of CHRISTMAS, a period which our ancestors were accustomed to devote to hospitality on a very large scale, to the indulgence indeed of hilarity and good cheer for, at least, twelve days, and sometimes, especially among the lower ranks, for six weeks.

Christmas was always ushered in by the due observance of its _Eve_, first in a religious and then in a festive point of view. "Our forefathers," remarks Bourne, "when the common devotions of the _Eve_ were over, and night was come on, were wont to light up _candles_ of an uncommon size, which were called _Christmas-candles_, and to lay a _log_ of wood upon the fire, which they termed a _Yule-clog_, or Christmas-block. These were to illuminate the house, and turn the night into day; which custom, in some measure, is still kept up in the northern parts."[194:A]

This mode of rejoicing, at the winter solstice, appears to have originated with the Danes and Pagan Saxons, and was intended to be emblematical of the return of the sun, and its increasing light and heat; _gehol_ or _Geol_, Angl. Sax. _Jel_, _Jul_, _Huil_, or _Yule_, Dan. Sax. Swed., implying the idea of _revolution_ or of _wheel_, and not only designating, among these northern nations, the month of December, called _Jul_-Month, but the great feast also of this period.[194:B] On the introduction of Christianity, the illuminations of the _Eve of Yule_ were continued as representative of the _true light_ which was then ushered into the world, in the person of our Saviour, the _Day spring from on High_.

The ceremonies and festivities which were observed on Christmas-Eve during the sixteenth and seventeenth centuries, and which in some parts of the north have been partially continued, until within these last thirty years, consisted in bringing into the house, with much parade and with vocal and instrumental harmony, the _Yule_ or _Christmas-block_, a massy piece of fire-wood, frequently the enormous root of a tree, and which was usually supplied by the carpenter attached to the family. This being placed in the centre of the great hall, each of the family, in turn, sate down upon it, sung a _Yule-Song_, and drank to a _merry Christmas_ and a _happy new year_. It was then placed on the large open hearth in the hall chimney, and, being lighted with the last year's brand, carefully preserved for this express purpose, the music again struck up, when the addition of fuel already inflamed, expedited the process, and occasioned a brilliant conflagration. The family and their friends were then feasted with _Yule-Dough_ or _Yule-cakes_, on which were impressed the figure of the child Jesus; and with bowls of _frumenty_, made from wheat cakes or creed wheat, boiled in milk, with sugar, nutmeg, &c. To these succeeded tankards of spiced ale, while preparations were usually going on among the domestics for the hospitalities of the succeeding day.

In the curious collection of Herrick is preserved a poem descriptive of some of these observances, and which was probably written for the express purpose of being sung during the kindling of the Yule-clog.

"COME, bring with a noise, My merrie, merrie boyes, The Christmas Log to the firing; While my good Dame, she Bids ye all be free, And drink to your hearts desiring.

With the last yeere's brand Light the new block, and For good success in his spending, On your psalteries play, That sweet luck may Come while the Log is a teending.[195:A]

Drink now the strong beere, Cut the white loafe here,[195:B] The while the meat is a shredding For the rare mince-pie, And the plums stand by To fill the paste that's a kneading."[195:C]

It was customary on this _eve_, likewise, to decorate the windows of every house, from the nobleman's seat to the cottage, with bay, laurel, ivy, and holly leaves, which were continued during the whole of the Christmas-holidays, and frequently until Candlemas. Stowe, in his Survey of London, particularly mentions this observance:—"Against the feast of _Christmas_," says he, "every man's house, as also their parish churches, were decked with holm, ivie, bayes, and whatsoever the season of the yeere aforded to be greene: The conduits and standards in the streetes were likewise garnished. Amongst the which, I read, that in the yeere 1444, by tempest of thunder and lightning, on the first of February at night, Paul's steeple was fired, but with great labour quenched, and toward the morning of Candlemas day, at the Leaden Hall in Cornhill, a standard of tree, beeing set up in the midst of the pavement fast in the ground, nayled full of holme and ivy, for disport of Christmas to the people; was torne up, and cast downe by the _malignant spirit_ (as was thought) and the stones of the pavement all about were cast in the streetes, and into divers houses, so that the people were sore agast at the great tempests."[196:A]

This custom, which still prevails in many parts of the kingdom, especially in our parish-churches, is probably founded on a very natural idea, that whatever is green, at this bleak season of the year, may be considered as emblematic of joy and victory, more particularly the laurel, which had been adopted by the Greeks and Romans, for this express purpose. That this was the opinion of our ancestors, and that they believed the _malignant spirit_ was envious of, and interested in destroying these symbols of their triumph, appears from the passage just quoted from Stowe.

It has been, indeed, conjectured, that this mode of ornamenting churches and houses is either allusive to numerous figurative expressions in the prophetic Scriptures typical of Christ, as the _Branch of Righteousness_, or that it was commemorative of the style in which the first Christian churches in this country were built, the materials for the erection of which being usually _wrythen wands or boughs_[196:B]; it may have, however, an origin still more remote, and fancy may trace the misletoe, which is frequently used on these occasions, to the times of the ancient Druids, an hypothesis which acquires some probability from a passage in Dr. Chandler's Travels in Greece, where he informs us, "It is related where Druidism prevailed, the _houses_ were _decked_ with _evergreens_ in _December_, that the Sylvan spirits might repair to them, and remain unnipped with frost and cold winds, until a milder season had renewed the foliage of their darling abodes."[197:A]

The morning of the Nativity was ushered in with the chaunting of _Christmas Carols_, or _Pious Chansons_. _The Christmas Carol_ was either _scriptural_ or _convivial_, the first being sung morning and evening, until the twelfth day, and the second during the period of feasting or carousing.

"As soon as the morning of the Nativity appears," says Bourne, "it is customary among the common people to sing a _Christmas Carol_, which is a song upon the birth of our Saviour, and generally sung from the Nativity to the Twelfth-day; this custom," he adds, "seems to be an imitation of the _Gloria in Excelsis_, or _Glory be to God on High_, &c. which was sung by the angels, as they hovered o'er the fields of Bethlehem on the morning of the Nativity; for even that song, as the learned Bishop Taylor observes, was a Christmas Carol. _As soon_, says he, _as these blessed Choristers had sung their Xmas Carol, and taught the Church a hymn, to put into her offices for ever, on the anniversary of this festivity; the angels_," &c.[197:B] We can well remember that, during the early period of our life, which was spent in the north of England, it was in general use for the young people to sing a _carol_ early on the morning of this great festival, and the burthen of which was,

"All the angels in heaven do sing On a Chrismas day in the morning;"

customs such as this, laudable in themselves and highly impressive on the youthful mind, are, we are sorry to say, nearly, if not totally, disappearing from the present generation.

To the carols, hymns, or pious chansons, which were sung about the streets at night, during Christmas-tide, Shakspeare has two allusions; one in _Hamlet_, where the Prince quotes two lines from a popular ballad entitled "_The Songe of Jepthah's Daughter_," and adds, "The first row of the pious chanson will show you more[198:A];" and the other in the _Midsummer-Night's Dream_, where

Titania remarks that

"No night is now with _hymn_ or _carol_ blest."[198:B]

Upon the first of these passages Mr. Steevens has observed that the "_pious chansons_ were a kind of _Christmas carols_, containing some scriptural history thrown into loose rhymes, and sung about the streets by the common people;" and upon the second, that "_hymns_ and _carols_, in the time of Shakspeare, during the season of Christmas, were sung every night about the streets, as a pretext for collecting money from house to house."

Carols of this kind, indeed, were, during the sixteenth century, sung at Christmas, through every town and village in the kingdom; and Tusser, in his _Five Hundred Pointes of Good Husbandrie_, introduces one for this season, which he orders to be sung to the tune of _King Salomon_.[198:C]

The chief object of the common people in chaunting these _nightly_ carols, from house to house, was to obtain money or _Christmas-Boxes_, a term derived from the usage of the Romish priests, who ordered masses at this time to be made to the Saints, in order to atone for the excesses of the people, during the festival of the Nativity, and as these masses were always purchased of the priest, the poor were allowed to gather money in this way with the view of liberating themselves from the consequence of the debaucheries of which they were enabled to partake, through the hospitality of the rich.

The _convivial_ or _jolie carols_ were those which were sung either by the company, or by itinerant minstrels, during the revelry that daily took place, in the houses of the wealthy, from Christmas-Eve to Twelfth Day. They were also frequently called _Wassel Songs_, and may be traced back to the Anglo-Norman period. Mr. Douce, in his very interesting "Illustrations of Shakspeare and of Ancient Manners," has given us a Christmas-carol of the thirteenth or fourteenth century written in the Norman language, and which may be regarded, says he, "as the most ancient drinking song, composed in England, that is extant. This singular curiosity," he adds, "has been written on a spare leaf in the middle of a valuable miscellaneous manuscript of the fourteenth century, preserved in the British Museum, Bibl. Regal. 16, E. 8."[199:A] To the original he has annexed a translation, admirable for its fidelity and harmony, and we are tempted to insert three stanzas as illustrative of manners and diet which still continued fashionable in the days of Shakspeare. We shall prefix the first stanza of the original, as a specimen of the language, with the observation, that from the word _Noel_, which occurs in it, Blount has derived the term _Ule_ or _Yule_; the French _Nouël_ or Christmas, he observes, the Normans corrupted to _Nuel_, and from _Nuel_ we had _Nule_, or _Ule_.[199:B]

"Seignors ore entendez a nus, De loinz sumes renuz a wous, Pur quere NOEL; Car lem nus dit que en cest hostel Soleit tenir sa feste anuel A hi cest jur."

"Lordings, from a distant home, To seek old CHRISTMAS we are come, Who loves our minstrelsy: And here, unless report mis-say, The grey-beard dwells; and on this day Keeps yearly wassel, ever gay, With festive mirth and glee.

Lordings list, for we tell you true; CHRISTMAS loves the jolly crew That cloudy care defy: His liberal board is deftly spread With manchet loaves and wastel-bread; His guests with fish and flesh are fed, Nor lack the stately pye.

Lordings, it is our hosts' command, And Christmas joins him hand in hand, To drain the brimming bowl: And I'll be foremost to obey: Then pledge me sirs, and drink away, For CHRISTMAS revels here to day And sways without controul. Now _Wassel_ to you all! and merry may ye be! But foul that wight befall, who _Drinks_ not _Health_ to me!"[200:A]

Manchet loaves, _wastel-bread_, and the _stately pye_, that is, a _peacock_ or _pheasant_ pye, were still common in the days of Shakspeare. During the prevalence of chivalry, it was usual for the knights to take their vows of enterprise, at a solemn feast, on the presentation to each knight, in turn, of a roasted peacock in a golden dish. For this was afterwards substituted, though only in a culinary light, and as the most magnificent dish which could be brought to table, a peacock in a pie, preserving as much as possible the form of the bird, with the head elevated above the crust, the beak richly gilt, and the beautiful tail spread out to its full extent. In allusion to these superb dishes a ludicrous oath was prevalent in Shakspeare's time, which he has, with much propriety, put into the mouth of Justice Shallow, who, soliciting the stay of the fat knight, exclaims,

"By _cock and pye_, sir, you shall not away to night."[201:A]

The use of the peacock, however, as one of the articles of a second course, continued to the close of the seventeenth century; for Gervase Markham, in the ninth edition of his _English House-Wife_, London 1683, enumerating the articles and ordering of a _great feast_, mentions this, among other birds, now seldom seen as objects of cookery; "then in the second course she shall first

preferr the lesser wild-fowl, as &c. then the lesser land-fowl as &c. &c. then the great wild-fowl, as _bittern_, _hearn_, _shoveler_, _crane_, bustard, and such like. Then the greater land-fowl, as PEACOCKS, phesant, _puets_, _gulls_, &c."[201:B]

Numerous collections of _Carols_, or _festal chansons_, to be sung at the various feasts and ceremonies of the Christmas-holidays, were published during the sixteenth century. One of the earliest of these was printed by Wynkyn de Worde in 1521, and entitled _Christmasse carolles_. It contains, among many very curious specimens of this species of popular poetry, one, which not only contributed to the hilarity of our ancestors in the reigns of Henry, Elizabeth, and James, but is still in use, though with many alterations, in Queen's College, Oxford; it is designated as _a Carol bryngyng in the bores head_, which was the first dish served up at the baron's high table in the great hall on Christmas-day, and was usually accompanied by a procession, with the sound of trumpets and other instruments.

"_Caput Apri defero, Reddens laudes Domino._ The bores head in hande bringe I, With garlandes gay and rosemary. I pray you all synge merily, _Qui estis in convivio_.

The bores head, I understande, Is the chefe servyce in this lande: Loke wherever it be fande _Servite cum cantico_.

Be gladde lordes, both more and lasse, For this hath ordayned our stewarde To chere you all this christmasse, The bores head with mustarde."[202:A]

For the hospitality, indeed, the merriment and good cheer, which prevailed during the season of Christmas, this country was peculiarly distinguished in the sixteenth century. Setting aside the splendid manner in which this festival was kept at court, and in the capital, we may appeal to the country, in confirmation of the assertion; the hall of the nobleman and country-gentleman, and even the humbler mansions of the yeoman and husbandman, vied with the city in the exhibition of plenty, revelry, and sport. Of the mode in which the farmer and his servants enjoyed themselves, on this occasion, a good idea may be formed from the poem of Tusser, the first edition of which thus admonishes the housewife:—

"Get ivye and hull, woman deck up thyne house: and take this same brawne, for to seeth and to souse. Provide us good chere, for thou know'st the old guise: olde customes, that good be, let no man despise.

At Christmas be mery, and thanke god of all and feast thy pore neighbours, the great with the small."[202:B]

And in subsequent impressions, the articles of the _Christmas husbandlie fare_ are more particularly enumerated; for instance, good drinke, a blazing fire in the hall, brawne, pudding and souse, and mustard _with all_, beef, mutton, and pork, shred or minced pies _of the best_, pig, veal, goose, capon, and turkey, cheese, apples, and nuts, with _jolie carols_; a pretty ample provision for the rites of hospitality, and a powerful security against the inclemencies of the season!

The Hall of the baron, knight, or squire, was the seat of the same festivities, the same gambols, wassailing, mummery, and mirth, which usually took place in the palaces and mansions of the metropolis, and of these Jonson has given us a very curious epitome in his _Masque of Christmas_, where he has personified the season and its attributes in the following manner:

"_Enter CHRISTMAS with two or three of the Guard._

"He is attir'd in round hose, long stockings, a close doublet, a high crownd hat with a broach, a long thin beard, a truncheon, little ruffes, white shoes, his scarffes, and garters tyed crosse, and his drum beaten before him.—

"The names of his CHILDREN, with their attyres.

"_Mis-rule._ In a velvet cap with a sprig, a short cloake, great yellow ruffe like a reveller, his torch-bearer bearing a rope, a cheese and a basket.

"_Caroll._ A long tawny coat, with a red cap, and a flute at his girdle, his torch-bearer carrying a song booke open.

"_Minc'd Pie._ Like a fine cooke's wife, drest neat; her man carrying a pie, dish, and spoones.

"_Gamboll._ Like a tumbler, with a hoope and bells; his torch-bearer arm'd with a cole-staffe, and a blinding cloth.

"_Post And Paire._ With a paire-royall of aces in his hat; his garment all done over with payres, and purrs; his squier carrying a box, cards and counters.

"_New-Yeares-Gift._ In a blew coat, serving-man like, with an orange, and a sprig of rosemarie guilt on his head, his hat full of broaches, with a coller of gingerbread, his torch-bearer carrying a march-paine, with a bottle of wine on either arme.

"_Mumming._ In a masquing pied suite, with a visor, his torch-bearer carrying the boxe, and ringing it.

"_Wassall._ Like a neat sempster, and songster; her page bearing a browne bowle, drest with ribbands, and rosemarie before her.

"_Offering._ In a short gowne, with a porter's staffe in his hand; a wyth borne before him, and a bason by his torch-bearer.

"_Babie-Coche._ Drest like a boy, in a fine long coat, biggin, bib, muckender, and a little dagger; his usher bearing a great cake with a beane, and a pease."[203:A]

Of these personified attributes we have already noticed, at some length, the most material, such as _Misrule_, _Caroll_, _New-Year's-Gift_ and _Wassall_; to the account, however, which has been given of the Summer Lord of Misrule, from Stubbes's Anatomie of Abuses, it will be here necessary to add, that the sway of this mock prince, both in town and country, was still more absolute during the Christmas-holidays; "what time," says Holinshed, "of old ordinarie course there is alwaies one appointed to make sport in the court, called commonlie Lord of Misrule: whose office is not unknowne to such as have beene brought up in noblemen's houses, and among great house-keepers, which use liberal feasting in that season."[204:A] Stowe, likewise, has recorded, in his Survey, the universal domination of this holiday monarch. "In the feast of Christmas," he remarks, "there was in the king's house, wheresoever he was lodged, a _Lord of Misrule_, or _Master of merry desports_, and the like had yee in the house of every nobleman of honour, or good worship, were he spirituall or temporall. Amongst the which, the Maior of London, and either of the Sheriffes had their severall Lords of Misrule, ever contending without quarrell or offence, who should make the rarest pastimes to delight the beholders. These Lords beginning their rule on Alhallow Eve, continued the same til the morrow after the feast of the Purification, commonly called Candlemas-day: In all which space, there were fine and subtill disguisings, maskes and mummeries, with playing at cardes for counters, nayles and points _in every house_, more for pastime than for gaine."[204:B]

In short, the directions which are to be found for a grand Christmas in the capital, were copied with equal splendour and profusion in the houses of the opulent gentlemen in the country, who made it a point to be even lavish at this season of the year. We may, therefore, consider the following description as applying accurately to the Christmas hospitality of the Baron's hall.

"On Christmas-day, service in the church ended, the gentlemen presently repair into the hall to breakfast, with brawn, mustard, and malmsey.

"At dinner the butler, appointed for the Christmas, is to see the tables covered and furnished: and the ordinary butlers of the house are decently to set bread, napkins, and trenchers, in good form, at every table; with spoones and knives. At the first course is served in a fair and large bore's head, upon a silver platter, with minstralsye.

"Two 'servants' are to attend at supper, and to bear two fair torches of wax, next before the musicians and trumpeters, and stand above the fire with the music, till the first course be served in through the hall. Which performed, they, with the musick, are to return into the buttery. The like course is to be observed in all things, during the time of Christmas.

"At night, before supper, are revels and dancing, and so also after supper, during the twelve daies of Christmas. The Master of the Revels is, after dinner and supper, to sing a caroll, or song; and command other gentlemen then there present to sing with him and the company; and so it is very decently performed."[205:A]

Beside the revelry and dancing here mentioned, we may add, that it was customary, at this season, after the Christmas sports and games had been indulged in, until the performers were weary, to gather round the ruddy fire, and tell tales of legendary lore, or popular superstition. Herrick, recording the diversions of this period, mentions one of them as consisting of "winter's tales about the hearth[205:B];" and Grose, speaking of the source whence he had derived many of the superstitions narrated in the concluding section of his "Provincial Glossary," says, that he gives them, as they had, from age to age, been "related to a closing circle of attentive hearers, assembled in a winter's evening, round the capacious chimney of an old hall or manor-house;" and he adds, that tales of this description formed, among our ancestors, "a principal part of rural conversation, in all large assemblies, _and particularly those in Christmas holidays, during the burning of the Yule-block_."[205:C]

Of the conviviality which universally reigned during these holidays, a good estimate may be taken by a few lines from the author of Hesperides, who, addressing a friend at Christmas-tide, makes the following request:

———— "When your faces shine With bucksome meat and cap'ring wine, Remember us in cups full crown'd,— Untill the fired chesnuts leape For joy, to see the fruits ye reape From the plumpe challice, and the cup, That tempts till it be tossed up:— —— —— —— —— carouse Till Liber Pater[206:A] twirles the house About your eares;—— "Then" to the bagpipe all addresse, Till sleep takes place of wearinesse: And thus throughout, with Christmas playes, Frolick the full twelve holy-dayes."[206:B]

We shall close this detail of the ceremonies and festivities of Christmas with a passage from the descriptive muse of Mr. Walter Scott, in which he has collected, with his usual accuracy, and with his almost unequalled power of costume-painting, nearly all the striking circumstances which distinguished the celebration of this high festival, from an early period, to the close of the sixteenth century. They form a picture which must delight, both from the nature of its subject, and from the truth and mellowness of its colouring.

—— "Well our Christian sires of old Loved when the year its course had rolled, And brought blithe Christmas back again, With all his hospitable train. Domestic and religious rite Gave honour to the holy night: On Christmas eve the bells were rung;— The damsel donned her kirtle sheen; The hall was dressed with holly green; Forth to the wood did merry-men go, To gather in the misletoe. Then opened wide the baron's hall To vassal, tenant, serf and all; Power laid his rod of rule aside, And Ceremony doffed his pride. The heir with roses in his shoes, That night might village partner chuse; The lord, underogating, share The vulgar game of "post and pair." All hailed, with uncontrolled delight, And general voice, the happy night, That to the cottage, as the crown, Brought tidings of salvation down. The fire with well dried logs supplied, Went roaring up the chimney wide; The huge hall-table's oaken face, Scrubbed till it shone, the day to grace, Bore then upon its massive board No mark to part the squire and lord. Then was brought in the lusty brawn, By old blue-coated serving-man; Then the grim boar's-head frowned on high, Crested with bays and rosemary. Well can the green-garbed ranger tell, How, when, and where, the monster fell; What dogs before his death he tore, And all the baiting of the boar. The wassol round, in good brown bowls, Garnished with ribbons, blithely trowls. There the huge sirloin recked: hard by Plumb-porridge stood, and Christmas pye; Nor failed old Scotland to produce, At such high tide, her savoury goose. Then came the merry masquers in, And carols roared with blithesome din; If unmelodious was the song, It was a hearty note, and strong. Who lists may in their mumming see Traces of ancient mystery; White shirts supplied the masquerade, And smutted cheeks the visors made; But, O! what masquers, richly dight, Can boast of bosoms half so light! England was merry England, when Old Christmas brought his sports again. 'Twas Christmas broached the mightiest ale; 'Twas Christmas told the merriest tale; A Christmas gambol oft could cheer The poor man's heart through half the year."[208:A]

FOOTNOTES:

[124:A] Selden, under the article Pope. The _Table Talk_, though not printed until A. D. 1689, is a work illustrative of the era under our consideration.

[128:A] Galfred. Monumeth. l. 3. c. 1. _Robert_ of _Gloucester_ gives us a similar account of the origin of this ceremony, and makes the same observation as to its general prevalency. The rude lines of the ancient poet have been thus beautifully paraphrased in the Antiquarian Repertory:—

'Health, my Lord King,' the sweet Rowena said— 'Health,' cried the Chieftain to the Saxon maid; Then gaily rose, and, 'mid the concourse wide, Kiss'd her hale lips, and plac'd her by his side. At the soft scene such gentle thoughts abound, That healths and kisses 'mongst the guests went round: From this the social custom took its rise, We still retain, and still must keep the prize.

[129:A] "The ingenious remarker on this representation observes, that it is the figure of the old Wassel-Bowl, so much the delight of our hardy ancestors, who on the vigil of the New-Year never failed to assemble round the glowing hearth, with their chearful neighbours, and then in the spicy Wassel-Bowl (which testified the goodness of their hearts) drowned every former animosity, an example worthy modern imitation. _Wassel_ was the word, _Wassel_ every guest returned as he took the circling goblet from his friend, whilst song and civil mirth brought in the infant year." [130:D] Act v. sc. 1.

[131:A] Warton's Milton, 2d edit. p. 160. The _Peg Tankard_, a species of Wassail-Bowl introduced by the Saxons, was still in use in the days of Shakspeare. I am in possession of one, which was given to a member of my family about one hundred and fifty years ago; it is of chased silver, containing nearly two quarts, and is divided by four pegs.

This form of the _wassail_ or _wish-health bowl_ was introduced by _Dunstan_, with the view of checking the intemperance of his countrymen, which for a time it effected; but subsequently the remedy was converted into an additional stimulus to excess; "for, refining upon Dunstan's plan, each was obliged to drink precisely to a pin, whether he could sustain a quantity of liquor equal to others or not: and to that end it became a rule, that whether they exceeded, or fell short of the prescribed bumper, they were alike compelled to drink _again_, until they reached the next mark. In the year 1102, the _priests_, who had not been backward in joining and encouraging these drunken assemblies, were ordered to avoid such abominations, and wholly to _discontinue_ the practice of "DRINKING TO PEGS." Some of these PEG or PIN CUPS, or _Bowls_, and PIN or PEG TANKARDS, are yet to be found in the cabinets of antiquaries; and we are to trace from their use some common terms yet current among us. When a person is much elated, we say he is "IN A MERRY PIN," which no doubt originally meant, he had reached that _mark_ which had deprived him of his usual sedateness and sobriety: we talk of taking a man "A PEG LOWER," when we imply we shall check him in any forwardness; a saying which originated from a regulation that deprived all those of their turn of drinking, _or of their Peg_, who had become troublesome in their liquor: from the like rule of society came also the expression of "HE IS A PEG TOO LOW," _i. e._ has been restrained too far, when we say that a person is not in equal spirits with his company; while we also remark of an individual, that he is getting on "PEG BY PEG," or, in other words, he is taking greater freedoms than he ought to do, which formerly meant, he was either drinking out of his turn, or, contrary to express regulation, did not confine himself to his proper portion, or _peg_, but drank into the _next_, thereby taking a double quantity." Brady's Clavis Calendaria, vol. ii. p. 322, 323. 1st edit.

[133:A] Nichols's Progresses of Elizabeth, vol. i. Entertainments at the Temple, &c. p. 22. 24.

[134:A] The only rite that still lingers among us on the Twelfth Day, is the election of a King and Queen, a ceremony which is now usually performed by drawing tickets, and of which Mr. Brand, in his commentary on Bourne's Antiquities of the Common People, has extracted the subsequent detail from the Universal Magazine of 1774:—"I went to a Friend's house in the country to partake of some of those innocent pleasures that constitute a merry Christmas; I did not return till I had been present at _drawing King and Queen_, and _eaten_ a _Slice_ of the _Twelfth Cake_, made by the fair hands of my good friend's Consort. After Tea Yesterday, a _noble Cake_ was produced, and two _Bowls_, containing the _fortunate chances_ for the different sexes. Our Host _filled up_ the _tickets_; the whole company, except the _King_ and _Queen_, were to be _Ministers of State_, _Maids of Honour_, or _Ladies of the Bed-chamber_.

"Our kind _Host_ and _Hostess_, whether by _design_, or _accident_ became _King_ and _Queen_. According to _Twelfth-Day Law_, each _party_ is to _support_ their _character_ till Mid-night. After supper one called for a _Kings Speech_, &c." Observations on Popular Antiquities, edit. of 1810, p. 228.

[135:A] Dr. Johnson's definition of the word _Rock_ in the sense of the text, is as follows:

"(_rock_, Danish; _rocca_, Italian; _rucca_, Spanish; _spinrock_, Dutch) A distaff held in the hand, from which the wool was spun by twirling a ball below." I shall add one of his illustrations:

"A learned and a manly soul I purpos'd her; that should with even powers, The _rock_, the spindle, and the sheers, controul Of destiny, and spin her own free hours. _Ben Jonson._"

[140:C] Hesperides, p. 337, 338.

[141:A] Hesperides, p. 361. Dramatic amusements were frequent on this day, as well in the halls of the nobility in the country, as at court. With regard to their exhibition in the latter, many documents exist; for instance, in a chronological series of Queen Elizabeth's payments for plays acted before her (from the Council Registers) is the following entry:

"18th March, 1573-4. To Richard Mouncaster, (Mulcaster, the Grammarian,) for two plays presented before her on Candlemas-day and Shrove-tuesday last, 20 marks."[141:B]

[141:B] Gentleman's Magazine, vide life of Richard Mulcaster, May, June, and July, 1800.

[142:A] Hilman's Tusser, p. 80. Mr. Hilman seems to have had as great an aversion to tobacco as King James; for, in another part of his notes, he observes, that "_Suffolk_ and _Essex_ were the counties wherein our author was a farmer, and no where are better dairies for butter, and neater housewives than there, _if too many of them at present do not smoke tobacco_." p. 19.

[143:A] Reed's Shakspeare, vol. viii. p. 272, 273. Act ii. sc. 2. Warner has also noticed this culinary article as appropriated to Shrove-Tuesday in his Albion's England, chapter xxiv., where, enumerating the feasts and holidays of his time, he says, they had

"At fasts-eve pan-puffes."— _Chalmers's Poets_, vol. iv. p. 564.

Shrove or _Pancake Tuesday_, is still called, in the North, _Fastens_, or _Fasterns E'en_, as preceding _Ash-Wednesday_, the first day of Lent; and the turning of these cakes in the pan is yet observed as a feat of dexterity and skill.

Of the _pancake-bell_ which used to be rung on Shrove-Tuesday, Taylor, the Water Poet, has given us the following most singular account:—"Shrove-Tuesday, at whose entrance in the morning all the whole kingdom is unquiet, but by that time the clocke strikes eleven, which (by the help of a knavish sexton) is commonly before nine, then there is a bell rung, cal'd pancake-bell, the sound whereof makes thousands of people distracted, and forgetful either of manners or humanitie." See his Works, folio, 1630. p. 115.

[143:B] —_my wife's as all_;] _i. e._ as all women are. Farmer.

[144:A] Reed's Shakspeare, vol. xii. p. 235.

[144:B] See his Masque on the Shrove-tuesday at night 1608, and Chloridia, a Masque, at Shrove-tide, 1630.

[144:C] The author of _Apollo Shroving_ was _William Hawkins_, who likewise published "Corolla varia contexta per Guil. Haukinum scholarcham Hadleianum in agro Suffolcienci. Cantabr. ap. Tho. Buck." 12mo. 1634.

It may be observed, that _Shrove-Tuesday_ was considered by the _apprentices_ as their peculiar _holiday_, and it appears that in the days of Shakspeare, they claimed a right of punishing, at this season, women of ill-fame. To these customs Dekker and Sir Thomas Overbury allude, when the former says: "They presently (like Prentises upon Shrove-Tuesday) take the lawe into their

owne handes and do what they list." Seven Deadly Sinnes of London, 4to. p. 35. 1606. And when the latter, in his Characters, speaking of a bawd, remarks: "Nothing daunts her so much as the approach of Shrove-Tuesday;" and describing a "roaring boy," adds, "he is a supervisor of brothels, and in them is a more unlawful reformer of vice than prentices on Shrove-Tuesday."

[145:B] Vide Strutt's Sports and Pastimes, p. 250.

[145:C] Vide Hogarth Moralized, p. 134.

[145:D] "In some places," says Mr. Strutt, "it was a common practice to put the cock into an earthern vessel made for the purpose, and to place him in such a position that his head and tail might be exposed to view; the vessel, with the bird in it, was then suspended across the street, about twelve or fourteen feet from the ground, to be thrown at by such as chose to make trial of their skill; two-pence was paid for four throws, and he who broke the pot, and delivered the cock from his confinement, had him for a reward. At North-Walsham, in Norfolk, about forty years ago, some wags put an owl into one of these vessels; and having procured the head and tail of a dead cock, they placed them in the same position as if they had appertained to a living one; the deception was successful; and at last, a labouring man belonging to the town, after several fruitless attempts, broke the pot, but missed his prize; for the owl being set at liberty, instantly flew away, to his great astonishment, and left him nothing more than the head and tail of the dead bird, with the potsherds, for his money and his trouble; this ridiculous adventure exposed him to the continual laughter of the town's people, and obliged him to quit the place, to which I am told he returned no more." Sports and Pastimes, p. 251.

"For many years," observes Mr. Brady, "our public diaries, and monthly publications, took infinite pains to impress upon the minds of the populace a just abhorrence of such barbarities (cock-fighting and cock-throwing); and, by way of strengthening their arguments, they failed not to detail in the most pathetic terms the following fact, which for the interest it contains is here transcribed, from the Obituary of the Gentleman's Magazine for April, 1789. 'Died, April 4th, at Tottenham, JOHN ARDESOIF, esquire, a young man of large fortune, and in the splendour of his horses and carriages, rivalled by few country-gentlemen. His table was that of hospitality, where it may be said he sacrificed too much to conviviality. _Mr. Ardesoif_ was very fond of cock-fighting, and had a favourite cock upon which he had won many profitable matches. The last bet he laid upon this cock he lost, which so enraged him, that he had the bird tied to a spit, and roasted alive before a large fire. The screams of the miserable animal were so affecting, that some gentlemen who were present attempted to interfere, which so enraged _Mr. Ardesoif_, that he seized a poker, and with the most furious vehemence declared, that he would kill the first man who interfered: but in the midst of his passionate asseverations, _he fell down dead upon the spot_.' Clavis Calendaria, 1st edit. vol. i. p. 200, 201."

[146:A] Bourne's Antiquities apud Brand, p. 268.

[147:A] Bourne's Antiquities apud Brand, p. 277. "Why they should play at _Hand Ball_ at this time," observes Mr. Bourne, "rather than any other game, I have not been able to find out, but I suppose it will readily be granted, that this custom of so playing, was the original of our present recreations and diversions on Easter Holy Days," p. 277.

[147:B] Brand on Bourne, p. 280. note. The _morris dance_, of which such frequent mention is made in our old poets, was frequently performed at Easter; but, as we shall have occasion to notice this amusement, at some length, under the article "May-Day," we shall here barely notice that Warner has recorded it as an Easter diversion in the following line:

"At _Paske begun_ our _morrise_: and ere Penticost our May." _Albion's England_, Chap. xxiv.

[147:C] _Rack_ or _Manger_.

[148:A] Fuller's Worthies, p. 188.

[148:B] Bourne apud Brand, p. 316.

[148:C] The following whimsical custom, relates Mr. Brand, "is still retained at the city of Durham on these holidays. On one day the men take off the women's shoes, which are only to be redeem'd by a present; on another day the women take off the men's in like manner." Bourne apud Brand, p. 282.

Stow also records, that in the week before Easter there were "great shewes made, for the fetching in of a twisted tree, or With, as they tearmed it, out of the Woods into the King's house, and the like into every man's house of Honor or Worship," p. 150.; but whether this was general throughout the kingdom, is not mentioned.

[149:A] Vide Ross, as published by Hearne, p. 105.

[149:B] Spelman's Glossary, under the title Hock-day.

[151:A] Nichols's Progresses of Queen Elizabeth, vol. i. Laneham's Letter, p. 32-34.

[151:B] That Hock-tide was _generally_ observed in the days of Shakspeare, is evident from the following passage in Withers's "Abuses Stript and Whipt." 8vo. London. 1618.

"Who think (forsooth) because that once a yeare They can affoord the poore some slender cheere, Observe their country feasts, or common doles, And entertaine their Christmass Wassaile Boles, Or els because that, _for the Churche's good, They in defence of HOCKTIDE custome stood_: A Whitsun-ale, or some such goodly motion, The better to procure young men's devotion: What will they do, I say, that think to please Their mighty God with such fond things as these? Sure, very ill." P. 232.

[156:A] Act iv. sc. 1. Reed's Shakspeare, vol. iv. p. 452, 453.—"The _rite_ of this month," observes Mr. Steevens, "was once so universally observed, that even authors thought their works would obtain a more favourable reception, if published on _May-day_. The following is a title-page to a metrical performance by a once celebrated poet, Thomas Churchyard:

'Come bring in _Maye_ with me, My _Maye_ is fresh and greene; A subjectes harte, an humble mind, To serve a mayden Queene.

'A discourse of rebellion, drawne forth for to warne the wanton wittes how to kepe their heads on their shoulders.

'Imprinted at London, in Flete-streat by William Griffith, Anno Domini 1570. The _first_ of _Maye_.'"

[165:B] Act iv. sc. 3. Reed's Shakspeare, vol. ix. p. 345.

[165:C] Canto Madrigals, of 5 and 6 parts, apt for the viols and voices. Made and newly published by Thomas Weelkes of the Coledge at Winchester, Organist. At London printed by Thomas Este, the assigne of Thomas Morley. 1600. 4to.

[166:A] Censura Literaria, vol. ix. p. 34.

[166:B] It is probable indeed from the subsequent Madrigal, that the Hobby-horse was frequently attached to, and provided for, by the town or village.

"Our country swains, in the morris daunce, Thus woo'd and win their brides; _Will, for our towne, the hobby horse A pleasure frolike rides_."[166:C]

[166:C] Vide Cantus primo. Madrigals to 3, 4, 5, and 6 voyces. Made and newly published by Thomas Weelkes at London, printed by Thomas Este, 1597, 4to. Censura Literaria, vol. ix. p. 9-10.

[167:A] "The English were famed," observes Dr. Grey, "for these and such like diversions; and even the old, as well as young persons, formerly followed them: a remarkable instance of which is given by Sir William Temple, (Miscellanea, Part 3. Essay of Health and Long Life,) who makes mention of a Morrice Dance in Herefordshire, from a noble person, who told him he had a pamphlet in his library written by a very ingenious gentleman of that county, which gave an account how, in such a year of King James's reign, there went about the country a sett of Morrice Dancers, composed of _ten_ men, who danced a Maid Marian, and a taber and pipe: and how these ten, one with another, made up twelve hundred years. 'Tis not so much, says he, that so many in one county should live to that age, as that they should be in vigour and humour to travel and dance." Grey's Notes on Shakspeare, vol. i. p. 382.

[168:A] _Courtpie_, in women's dress, a short vest. Strutt.

[168:B] _Watchet-coloured_, pale blue. Strutt.

[168:C] _Rochet_, a lawn garment resembling a surplice gathered at the wrists. Strutt.

[168:D] _Baudekin_, a cloth of gold tissue, with figures in silk, for female dress. Strutt.

[169:A] The mole-taker, in this place, personates the character of the _fool_ or domestic buffoon.

[170:A] The management of the hobby-horse appears to have been the most difficult part of the May-day festivities, and from the following passage in an old play, to have required some preparatory discipline. A character personating this piece of pageantry, and angry with the mayor of the town as being his rival, calls out, "Let the mayor play the hobby-horse among his brethren, an he will, I hope our towne-lads cannot want a hobby-horse. Have I practic'd my reines, my careeres, my pranckers, my ambles, my false trotts, my smooth ambles and Canterbury paces, and shall master mayor put me besides the hobby-horse? Have I borrowed the fore horse bells, his plumes and braveries, nay had his mane new shorne and frizl'd, and shall the mayor put me besides the hobby-horse?" The Vow breaker, by Sampson.

[170:B] The morris-dance in this description of the May-game seems to have been performed chiefly by the fool, with the occasional assistance of the hobby-horse, which was always decorated with bells, and the dragon.

[172:B] The Metamorphosed Gipsies, fol. edit. vol. 2. p. 65.—This folio edition of Jonson's works, in two volumes, dated 1640, is not regularly paged to the close of each volume; for instance, in vol. i. the Dramas terminate at p. 668, and then the Epigrammes, Forest, Masques, &c. commence with p. 1.

[173:A] Act iv. sc. 1.—Jonson in his _Bartholmew Fayre_, acted in the year 1614, has a character of this kind, a Baker, who has undergone a similar conversion, and is thus introduced:—

"_Win. W._ What call you the Reverend _Elder_, you told me of? your Banbury-man.

Joh. _Rabbi Busy_, Sir, he is more than an _Elder_, he is a _Prophet_, Sir.

Quar. O, I know him! a Baker, is he not?

Joh. Hee was a Baker, Sir, but hee do's dreame now, and see visions, he has given over his Trade.

Quar. I remember that too: out of a scruple hee tooke, that (in spic'd conscience) those Cakes hee made, were serv'd to _Bridales_, _May poles_, _Morrisses_, and such prophane feasts and meetings; his Christen-name is _Zeale-of-the-land_ Busye." Jonson's Works, fol. edit. vol. ii. p. vi. act i. sc. 3.

[173:B] Reed's Shakspeare, vol. xviii. p. 198, note, Steevens.

[173:C] Wilson, censuring these indulgences, places the era of the publication of the Book of Sports under 1617, and says of it, that "some of the Bishops, pretending _Recreations_, and _liberty_ to servants and the common people (of which they carved to themselves too much already) procured the King to put out a Book to permit dancing about _May-poles_, _Church-ales_, and such debauched exercises upon the Sabbath-Day after Evening-Prayer (being a specious way to make the King, and them, acceptable to the _Rout_): which Book came out with a command, injoyning all Ministers to read it to their parishioners, and to approve of it; and those that did not, were brought into the high _Commission_, imprisoned and suspended." The History of Great Britain, being the Life and Reign of King James the First, relating to what passed from his first access to the Crown, till his death. Folio, London 1653. p. 105.

[191:B] Ibid. p. 393, 394.

[192:A] The magnificent reception of Queen Elizabeth at Norwich in 1578, has been recorded with great minuteness, in two tracts, by Bernard Goldingham and Thomas Churchyard the poet, which are reprinted in Mr. Nichols's Progresses; these accounts are likewise incorporated by Abraham Fleming as a supplement to Holinshed, and will be found in the last edition of this chronicler, in vol. iv. p. 375. The pomp and pageantry which were exhibited during this regal visit were equally gorgeous, quaint, and operose; "order was taken there," says Churchyard, "that every day, for sixe dayes together, a shew of some strange device should be seene; and the maior and aldermen appointed among themselves and their breethren, that no person reteyning to the Queene, shoulde be unfeasted, or unbidden to dinner and supper, during the space of those sixe dayes: which order was well and wisely observed, and gained their citie more fame and credite, than they wot of: for that courtesie of theirs shall remayne in perpetuall memorie, whiles the walles of their citie standeth."—Nichols's Progresses of Q. Elizabeth, vol. ii. p. 56.

[192:B] The wise policy of Elizabeth in establishing the Flemings in this country gave birth to our vast superiority in the woollen trade; and the first pageant which met the eyes of Elizabeth on her entrance into Norwich was the _artizan-strangers_ pageant, illustrative of the whole process of the manufactory, "a shewe which pleased her Majestie so greatly, as she particularly viewed the knitting and spinning of the children, perused the loombes, and noted the several workes and commodities which were made by these meanes."—Nichols's Progresses, vol. ii. p. 13.

[192:C] Gerguntum, a fabulous kind of Briton, who is supposed to have built Norwich Castle; in the procession which went out of Norwich to meet the Queen, on the 16th of August, 1578, was "one whiche represented King GURGUNT, some tyme king of Englande, whiche buylded the castle of Norwich, called Blanch Flowre, and layde the foundation of the citie. He was mounted uppon a brave courser, and was thus furnished: his body armed, his bases of greene and white silke; on his head a black velvet hat, with a plume of white feathers. There attended upon him three henchmen in white and greene: one of them did beare his helmet, the seconde his tergat, the thirde his staffe."—Nichols's Progresses, vol. ii. p. 5, 6.

[206:A] _Liber Pater_, Bacchus.

[206:B] Hesperides, p. 146. The following passages place in a strong and interesting point of view, the hospitality of our ancestors during this season of the year, and will add not a little to the impression derived from the text.

"Heretofore, noblemen and gentlemen of fair estates had their heralds who wore their coate of armes at Christmas, and at other solemne times, and cryed largesse thrice. They lived in the country like petty kings. They always eat in Gothic Halls where the Mummings and Loaf-stealing, and other Christmas sports, were performed. The hearth was commonly in the middle; whence the

saying, _round about our coal-fire_." Antiquarian Repertory, No. xxvi. from the MS. Collections of Aubrey, dated 1678.

"An English Gentleman at the opening of the great day, _i. e._ on Christmas Day in the morning, had all his tenants and neighbours entered his Hall by day-break. The strong beer was broached, and the black jacks went plentifully about with toast, sugar, nutmegg, and good Cheshire cheese. The Hackin, (the great sausage) must be boiled by day-break, or else two young men must take the maiden (_i. e._ the cook,) by the arms and run her round the market place till she is ashamed of her laziness.

"In Christmass Holidays, the tables were all spread from the first to the last; the sirloins of beef, the minced pies, the plumb-porridge, the capons, turkeys, geese, and plumb-puddings, were all brought upon the board: every one eat heartily, and was welcome, which gave rise to the proverb, 'Merry in the hall when beards wag all.'" From a Tract entitled "Round about our Coal-Fire, or Christmas Entertainments;" of which the first edition was published, I believe, about the close of the seventeenth century.

"Our ancestors considered Christmas in the double light of a holy commemoration and a cheerful festival; and accordingly distinguished it by devotion, by vacation from business, by merriment and hospitality. They seemed eagerly bent to make themselves and every body about them happy.—The great hall resounded with the tumultuous joys of servants and tenants, and the gambols they played served as amusement to the lord of the mansion and his family, who, by encouraging every art conducive to mirth and entertainment, endeavoured to soften the rigour of the season, and mitigate the influence of winter."—_The World_, No. 104.

[208:A] Scott's Marmion. Introduction to Canto Sixth. 8vo. edit. p. 300-303.

"At present, Christmas meetings," remarks Mr. Brady, "are chiefly confined to family parties, happy, it must be confessed, though less jovial in their nature; perhaps, too, less beneficial to society, because they can be enjoyed on other days not, as originally was the case, set apart for more general conviviality and sociability; not such as our old ballads proclaim, and history confirms, in which the most frigid tempers gave way to relaxation, and all in eager joy were ready to exclaim, in honour of the festivity,—

"For, since such delights are thine, CHRISTMAS, with thy bands I join." _Clavis Calendaria_, vol. ii. p. 319.

CHAPTER VII.

MANNERS AND CUSTOMS OF THE COUNTRY CONTINUED—WAKES—FAIRS—WEDDINGS—BURIALS.

Having described, in as brief a manner as was consistent with the nature of our work, the various circumstances accompanying the celebration of the most remarkable holidays and festivals, in the country, during the age of Shakspeare, from whose inimitable compositions we have drawn many pertinent illustrations on nearly all the subjects as they passed before us; we shall proceed, in the present chapter, to notice those remaining topics which are calculated to complete, on the scale adopted, a tolerably correct view of rural manners and customs, as they existed in the latter half of the sixteenth, and prior portion of the seventeenth, century.

A natural transition will carry us, from the description of the rural festival, to the gaieties of the WAKE or FAIR. Of these terms, indeed, the former originally implied the vigil which preceded the festival in honour of the Saint to whom the parish-church was dedicated; for "on the Eve of this day," remarks Mr. Borlase, in his Cornwall, "prayers were said, and hymns were sung all night in the church; and from these watchings the festivals were stiled _Wakes_; which name still continues in many parts of England, though the vigils have been long abolished."[209:A] The religious institution, however, of the _Wake_, whether held on the vigil or Saint's day, was soon forgotten; mirth and feasting early became the chief objects of this meeting[209:B], and it, at length, degenerated into something approaching towards a secular Fair. These Wakes or Fairs, which were rendered more popular in proportion as they deviated from their devotional origin, were, until the reign of Henry the Sixth, always held on a Sunday and its eve, a custom that continued to be partially observed as late as the middle of the seventeenth century; hence ale-houses, and places of public resort, in the immediate neighbourhood of church-yards, the former scene of Wakes, were still common at the close of Shakspeare's life; thus Sir Thomas Overbury, describing a Sexton, in his _Characters_, published in 1616, says: "At every church-style commonly there's an ale-house; where let him (the Sexton) bee found never so idle-pated, hee is still a grave drunkard."

The increasing licentiousness and conviviality, however, which attended these church-yard assemblies, frequented as they were by pedlars and hawkers of every description, finally occasioned their suppression in all places, at least, where much traffic was expected. In their room regular Fairs were established, to which in central or peculiar stations, the resort, at fixed periods, was immense.

Yet the _Wake_, the meeting for mere festivity and frolic, still continued in every village and small town, and though not preceded by any vigil in the church, was popularly termed the _Wake-Day_. Tusser, in his catalogue of the "Old Guise," has not forgotten this season of merriment; on the contrary, he seems to welcome its return with much cordiality:—

"Fil oven ful of flawnes, Ginnie passe not for sleepe, to morrow thy father his wake-daie wil keepe: Then every wanton may danse at hir wil, both Tomkin and Tomlin, and Jankin with Gil."[210:A]

Mr. Hilman, in his edition of Tusser, has made the following observations on this passage.—"Waking in the church," says he, "was left off because of some abuses, and we see here it was converted to wakeing at the oven. The other continued down to our author's days, and in a great many places continues still to be observed with all sorts of rural merriments; such as dancing, wrestling, cudgel-playing, &c." Bourne observes, that the feasting and sporting, on this occasion, usually lasted for two or three days[211:A]; and Bishop Hall gives an impressive idea of the revelry and glee which distinguished these rural assemblages, when he exclaims, "What should I speak of our _merry Wakes_, and May games—in all which put together, you may well say, no Greek can be _merrier_ than they."[211:B] Indeed from one end of the kingdom to the other, from north to south, it would appear, that, among the country-villages, during the reigns of Elizabeth and her two immediate successors, Wakes formed one of the principal amusements of the peasantry, and were anticipated with much eagerness and expectation. In confirmation of this we need only remark that Drayton, speaking of Lancashire, declares, that

—— "every village smokes at _wakes_ with lusty cheer;"[211:C]

and that Herrick, in Devonshire, has written a very curious little poem, entitled _The Wake_, which, as strikingly descriptive of the various business of this festivity, claims here an introduction:—

"Come Anthea, let us two Go to feast, as others do. Tarts and custards, creams and cakes, Are the junketts still at _Wakes_: Unto which the tribes resort, Where the businesse is the sport: Morris-dancers thou shalt see, Marian too in pagentrie: And a Mimick to devise Many grinning properties. Players there will be, and those Base in action as in clothes: Yet with strutting they will please The incurious villages. Neer the dying of the day, There will be a cudgell-play, Where a coxcomb will be broke, Ere a good _word_ can be spoke: But the anger ends all here, Drencht in ale, or drown'd in beere. Happy Rusticks, best content With the cheapest merriment: And possesse no other feare, Than to want the _Wake_ next yeare."[212:A]

Of the pedlars or hawkers who, in general, formed a constituent part of these _village-wakes_ an accurate idea may be drawn from the character of the pedlar Autolycus, in the _Winter's Tale_ of Shakspeare, who is delineated with the poet's customary strength of pencil, rich humour, and fidelity to nature. The wares in which he dealt are curiously enumerated in the following passages:—

"_Serv._ He hath songs, for men, or women, of all sizes; no milliner can so fit his customers with gloves[212:B]: he has the prettiest love-songs for maids; he hath ribands of all the colours i' the rainbow; points more than all the lawyers in Bohemia can learnedly handle, though they come to him by the gross; inkles, caddisses[212:C], cambricks, lawns: why, he sings them over, as they were gods or goddesses: you would think, a smock were a she-angel; he so chants to the sleeve-hand, and the work about the square on't."[212:D]

"_Enter Autolycus, singing._

"Lawn, as white as driven snow; Cyprus, black as e'er was crow; Gloves as sweet as damask roses; Masks for faces, and for noses; Bugle bracelet, necklace-amber, Perfume for a lady's chamber: Golden quoifs, and stomachers, For my lads to give their dears; Pins and poking-sticks of steel, What maids lack from head to heel: Come, buy of me, come; come buy, come buy; Buy, lads, or else your lasses cry; Come buy, &c."[213:A]

At the close of the feast Autolycus is represented as re-entering, and declaring "Ha, ha! what a fool honesty is! and trust, his sworn brother, a very simple gentleman! I have sold all my trumpery; not a counterfeit stone, not a riband, glass, pomander[213:B], brooch, table-book, ballad, knife, tape, glove, shoe-tye, bracelet, horn-ring, to keep my pack from fasting: they throng who should buy first; as if my trinkets had been hallowed, and brought a benediction to the buyer."[213:C]

In the North, the Village-Wake is still kept up, under the title of _The Hopping_, a word derived from the Anglo-Saxon, and thus applied, because dancing was the favourite amusement of these meetings. The reign of Elizabeth, indeed, was marked by a peculiar propensity to this exercise, and neither wake nor feast could be properly celebrated without the country lads and lasses footing it on the green or yard, or in bad weather, in the Manor-hall.

In an old play, entitled "A Woman Killed With Kindness," the production of Thomas Heywood, and acted in 1604, is to be found a very humorous description of one of these _Hoppings_, and particularly curious, as it enumerates the names of the dances then in vogue among these rustic performers. The poet, after remarking that now

——————————— "the mad lads And country lasses, every mother's child, With nosegays and bride laces in their hats, Dance all their country measures, rounds and jigs,"

thus introduces his couples:

"_Jenkin._ Come, Nick, take you Joan Miniver to trace withal; Jack Slime, traverse you with Sisly Milk-pail; I will take Jane Trubkin, and Roger Brickbat shall have Isabel Motley; and now strike up; we'll have a crash here in the yard.—

Jack Slime. Foot it quickly; if the music overcome not my melancholy, I shall quarrel; and if they do not suddenly strike up, I shall presently strike them down.

Jen. No quarrelling, for God's sake: truly, if you do, I shall set a knave between ye.

Jack Slime. I come to dance, not to quarrel; come, what shall it be? Rogero?

Jen. Rogero! no; we will dance 'The Beginning of the World.'

Sisly. I love no dance so well, as 'John, come kiss me now.'

Nicholas. I have ere now deserved a cushion; call for the Cushion-dance.

R. Brick. For my part, I like nothing so well as 'Tom Tyler.'

Jen. No; we'll have 'The hunting of the Fox.'

Jack Slime. 'The Hay! the Hay!' there's nothing like 'The Hay.'

Nich. I have said, do say, and will say again.

Jen. Every man agree to have it as Nick says.

All. Content.

Nich. It hath been, it now is, and it shall be.

Sisly. What? Mr. Nicholas? What?

Nich. 'Put on your smock a Monday.'

Jen. So, the dance will come cleanly off: come, for God's sake, agree of something; if you like not that, put it to the musicians; or let me speak for all, and we'll have 'Sellenger's Round.'

All. That, that, that!

Nich. No, I am resolved, thus it shall be. First take hands, then take ye to your heels.

Jen. Why, would you have us run away?

Nich. No; but I would have you shake your heels. Music, strike up. _They dance._"[214:A]

The _Fair_ or greater wake was usually held, as hath been observed, in a central situation, and its period and duration were, as at present, proclaimed by law. It was a scene of extensive business as well as of pleasure; for before provincial cities had attained either wealth or consequence, all communication between them was difficult, and neither the necessaries nor the elegances of life could be procured but at stated times, and at fixed depôts. It was usual, therefore, to go fifty or a hundred miles to one of these fairs, in order both to purchase goods and accommodations for the ensuing year, and to dispose of the superfluous products of art or cultivation. In the reign of Henry VI. the monks of the priories of Maxtoke in Warwickshire, and of Bicester in Oxfordshire, laid in their annual stores of common necessaries at Sturbridge Fair in Cambridgeshire, at least one hundred miles distant, and notwithstanding the two cities of Oxford and Coventry were in their immediate neighbourhood.[215:A] In the reign of Henry VIII., it

appears, from the Household-Book of Henry Percy, fifth Earl of Northumberland, that His Lordship's family were supplied with necessaries for the whole year from fairs. "He that stands charged with my Lordes House for the houll Yeir, if he maye possible, shall be at all Faires, where the greice Emptions shall be boughte for the House for the houll Yeir, as Wine, Wax, Beiffes, Muttons, Wheite and Malt[215:B];" and, in the reign of Elizabeth, Tusser recommends to his farmer the same plan, both for purchase and sale:

"At Bartilmewtide, or at Sturbridge faire, buie that as is needful, thy house to repaire: Then sel to thy profit, both butter and cheese, who buieth it sooner, the more he shall leese."[215:C]

That this custom prevailed until the commencement of the eighteenth century, and to nearly the same extent, is evident from a note on the just quoted lines of Tusser by Mr. Hilman. "Sturbridge Fair," says he, "stocks the country (namely, Norfolk, Suffolk, and Essex,) with clothes, and all other houshold necessaries; and they (the farmers) again, sell their butter and cheese, and whatever else remains on their hands; nay, there the shopkeepers supply themselves with divers sorts of commodities."

In the third year, indeed, of James I., Sturbridge Fair began to acquire such celebrity, that hackney coaches attended it from London; and it subsequently became so extensive that for several years not less than sixty coaches have been known to ply at this fair, then esteemed the largest in England.

Sturbridge Fair is still annually proclaimed, but now in such a state of decline, that its extinction, at least in a commercial light, cannot be far distant.

To these brief notices of wakes and fairs, it may be necessary to subjoin a slight detail of the state of _Country-Inns_ and Ale-houses during the age of Shakspeare.

To "take mine ease in mine inn" is a proverbial phrase, which the poet has placed in the mouth of Falstaff[216:A], and which implies a degree of comfort which has always been the peculiar attribute of an English house of public entertainment. That it was not less felt and enjoyed in Shakspeare's time than in our own, is very apparent from the accounts which have been left us by Harrison and Fynes Moryson; the former writing towards the close of the sixteenth, and the latter at the commencement of the seventeenth century. These descriptions, which are curiously faithful and highly interesting, paint the provincial hostelries of England as in a most flourishing state, and, according to Harrison, indeed, greatly superior to those which existed in the metropolis.

"Those townes," says the historian, "that we call thorowfaires, have great and sumptuous innes builded in them, for the receiving of such travellers and strange before using this eBook.

*** START OF THE PROJECT GUTENBERG EBOOK HAMLET ***

Transcriber's Note: This is a heavily edited version of _Hamlet_. It was used for Charles Kean's 1859 stage production. Phrases printed in italics in the book are indicated in this electronic version by _ (underscore). Footnotes originally appeared at the bottom of each page. For this electronic version the footnotes are collected at the end of each act. In Act I, Scene 5, the word Uumix'd has been changed to Unmix'd. A closing bracket] was added to Act IV footnote 37 after _Naked on your kingdom_,. A closing bracket] was added to Act IV footnote 50 after _Venom'd stuck_,. The word o'er-crows appears in Act V, Scene 3; in footnote V.81, o'ercrows appears without a hyphen. Both are as they appear in the book.

SHAKESPEARE'S TRAGEDY

OF

HAMLET, PRINCE OF DENMARK.

ARRANGED FOR REPRESENTATION AT THE Royal Princess's Theatre

WITH EXPLANATORY NOTES,

BY CHARLES KEAN, F.S.A.

AS PERFORMED ON MONDAY, JANUARY 10, 1859.

LONDON:

BRADBURY AND EVANS, 11, BOUVERIE STREET. 1859.

LONDON: BRADBURY AND EVANS, PRINTERS, WHITEFRIARS.

Dramatis Personæ

CLAUDIUS (_King of Denmark_) Mr. RYDER.

HAMLET (_son to the former and_ _nephew to the present King_). Mr. CHARLES KEAN.

POLONIUS (_Lord Chamberlain_) Mr. MEADOWS.

HORATIO (_friend To Hamlet_) Mr. GRAHAM.

LAERTES (_son To Polonius_) Mr. J. F. CATHCART.

ROSENCRANTZ } { Mr. BRAZIER. GUILDENSTERN } (_Courtiers_) { Mr. G. EVERETT. OSRICK } { Mr. DAVID FISHER.

PRIEST Mr. TERRY.

MARCELLUS Mr. PAULO.

BERNARDO Mr. DALY.

FRANCISCO Mr. COLLETT.

GHOST OF HAMLET'S FATHER Mr. WALTER LACY.

FIRST GRAVEDIGGER Mr. FRANK MATTHEWS.

SECOND GRAVEDIGGER Mr. H. SAKER.

FIRST PLAYER Mr. F. COOKE.

SECOND PLAYER Mr. ROLLESTON.

GERTRUDE (_Queen of Denmark, and_ _mother of Hamlet_) Mrs. CHARLES KEAN.

OPHELIA (_daughter of Polonius_) Miss HEATH.

ACTRESS Miss DALY.

STAGE DIRECTIONS.

R. H. means Right Hand; L. H. Left Hand; U. E. Upper Entrance; R. H. C. Enters through the Centre from the Right Hand; L. H. C. Enters through the Centre from the Left Hand.

RELATIVE POSITIONS OF THE PERFORMERS WHEN ON THE STAGE.

R. means on the Right side of the Stage; L. on the Left side of the Stage; C. Centre of the Stage; R. C. Right Centre of the Stage; L. C. Left Centre of the Stage.

The reader is supposed _to be on the Stage_, facing the audience.

PREFACE.

The play of _Hamlet_ is above all others the most stupendous monument of Shakespeare's genius, standing as a beacon to command the wonder and admiration of the world, and as a memorial to future generations, that the mind of its author was moved by little less than inspiration. _Lear_, with its sublime picture of human misery;--_Othello_, with its harrowing overthrow of a nature great and amiable;--_Macbeth_, with its fearful murder of a monarch, whose "virtues plead like angels trumpet-tongued against the deep damnation of his taking off,"--severally exhibit, in the most pre-eminent degree, all those mighty elements which constitute the perfection of tragic art--the grand, the pitiful, and the terrible. _Hamlet_ is a history of mind--a tragedy of thought. It contains the deepest philosophy, and most profound wisdom; yet speaks the language of the heart, touching the secret spring of every sense and feeling. Here we have no ideal exaltation of character, but life with its blended faults and virtues,--a gentle nature unstrung by passing events, and thus rendered "out of tune and harsh."

The original story of Hamlet is to be found in the Latin pages of the Danish historian, Saxo Grammaticus, who died in the year 1208. Towards the end of the sixteenth century, the French author, Francis de Belleforest, introduced the fable into a collection of novels, which were translated into English, and printed in a small quarto black letter volume, under the title of the "Historie of Hamblett," from which source Shakespeare constructed the present tragedy.

Saxo has placed his history about 200 years before Christianity, when barbarians, clothed in skins, peopled the shores of the Baltic. The poet, however, has so far modernised the subject as to make Hamlet a Christian, and England tributary to the "sovereign majesty of Denmark." A date can therefore be easily fixed, and the costume of the tenth and eleventh centuries may be selected for the purpose. There are but few authentic records in existence, but these few afford reason to believe that very slight difference existed between the dress of the Dane and that of the Anglo-Saxon of the same period.

Since its first representation, upwards of two centuries and a half ago, no play has been acted so frequently, or commanded such universal admiration. It draws within the sphere of its attraction both the scholastic and the unlearned. It finds a response in every breast, however high or however humble. By its colossal aid it exalts the drama of England above that of every nation, past or present. It is, indeed, the most marvellous creation of human intellect.

CHARLES KEAN.

HAMLET,

PRINCE OF DENMARK.

ACT I.

SCENE I.--ELSINORE. A PLATFORM BEFORE THE CASTLE. NIGHT.

FRANCISCO _on his post. Enter to him_ BERNARDO (L.H.)

Ber. Who's there?

Fran. (R.) Nay, answer me:[1] stand, and unfold[2] yourself.

Ber. Long live the king![3]

Fran. Bernardo?

Ber. He.

Fran. You come most carefully upon your hour.

Ber. 'Tis now struck twelve; get thee to bed, Francisco.

Fran. For this relief much thanks:

[_Crosses to_ L.]

'tis bitter cold, And I am sick at heart.

Ber. Have you had quiet guard?

Fran. Not a mouse stirring.

Ber. Well, good night. If you do meet Horatio and Marcellus, The rivals of my watch,[4] bid them make haste.

Fran. I think I hear them.--Stand, ho! Who's there?

Hor. Friends to this ground.

Mar. And liegemen to the Dane.[5]

Enter HORATIO _and_ MARCELLUS (L.H.)

Fran. Give you good night.

Mar. O, farewell, honest soldier: Who hath reliev'd you?

Fran. Bernardo hath my place. Give you good night.

[_Exit_ FRANCISCO, L.H.]

Mar. Holloa! Bernardo!

Ber. Say, What, is Horatio there?

Hor. (_Crosses to_ C.) A piece of him.[6]

Ber. (R.) Welcome, Horatio: welcome, good Marcellus.

Hor. What, has this thing appear'd again to-night?

Ber. I have seen nothing.

Mar. (L.) Horatio says, 'tis but our fantasy, And will not let belief take hold of him, Touching this dreaded sight, twice seen of us: Therefore I have entreated him, along With us, to watch the minutes of this night;[7] That, if again this apparition come, He may approve our eyes,[8] and speak to it.

Hor. Tush! tush! 'twill not appear.

Ber. Come, let us once again assail your ears, That are so fortified against our story, What we two nights have seen.[9]

Hor. Well, let us hear Bernardo speak of this.

Ber. Last night of all, When yon same star that's westward from the pole Had made his course to illume that part of heaven Where now it burns, Marcellus, and myself, The bell then beating one--

Mar. Peace, break thee off; look, where it comes again!

Enter Ghost (L.H.)

Ber. In the same figure, like the king that's dead.

Hor. Most like:--it harrows me with fear and wonder.[10]

Ber. It would be spoke to.

Mar. Speak to it, Horatio.

Hor. What art thou, that usurp'st this time of night,[11] Together with that fair and warlike form In which the majesty of buried Denmark Did sometimes march? By heaven I charge thee, speak!

Mar. It is offended.

[Ghost _crosses to_ R.]

Ber. See! it stalks away!

Hor. Stay!--speak!--speak, I charge thee, speak!

[_Exit_ Ghost, R.H.]

Mar. 'Tis gone, and will not answer.

Ber. How now, Horatio! You tremble, and look pale: Is not this something more than fantasy? What think you of it?

Hor. Before heaven, I might not this believe, Without the sensible and true avouch[12] Of mine own eyes.

Mar. Is it not like the king?

Hor. As thou art to thyself: Such was the very armour he had on, When he the ambitious Norway combated.

Mar. Thus, twice before, and jump at this dead hour,[13] With martial stalk hath he gone by our watch.

Hor. In what particular thought to work,[14] I know not; But in the gross and scope[15] of mine opinion, This bodes some strange eruption to our state.[16] In the most high and palmy[17] state of Rome, A little ere the mightiest Julius fell, The graves stood tenantless, and the sheeted dead Did squeak and gibber in the Roman streets.

Re-enter Ghost (R.H.)

But, (L.C.) soft, behold! lo, where it comes again! I'll cross it, though it blast me.

[HORATIO _crosses in front of the_ Ghost _to_ R. Ghost _crosses to_ L.]

Stay, illusion! If thou hast any sound, or use of voice,[18] Speak to me: If there be any good thing to be done, That may to thee do ease, and grace to me, Speak to me: If thou art privy to thy country's fate, Which, happily, foreknowing may avoid, O, speak! O, if thou hast uphoarded in thy life Extorted treasure in the womb of earth,[19] For which, they say, you spirits oft walk in death, Speak of it:--stay, and speak!

[_Exit_ Ghost, L.H.]

Mar. 'Tis gone! We do it wrong, being so majestical, To offer it the show of violence.

Ber. It was about to speak, when the cock crew.

Hor. And then it started like a guilty thing Upon a fearful summons.[20] I have heard, The cock, that is the trumpet of the morn, Doth with his lofty[21] and shrill-sounding throat Awake the god of day; and, at his warning, Whether in sea or fire, in earth or air, The extravagant and erring spirit[22] hies To his confine. But, look, the morn, in russet mantle clad, Walks o'er the dew of yon high eastern hill: Break we our watch up; and, by my advice, Let us impart what we have seen to-night Unto young Hamlet; for, upon my life, This spirit, dumb to us, will speak to him.

[_Exeunt_, L.H.]

SCENE II.--A ROOM OF STATE IN THE PALACE.

Trumpet March.

Enter the KING _and_ QUEEN, _preceded by_ POLONIUS, HAMLET, LAERTES,[23] Lords, Ladies, _and_ Attendants.

King. (R.C.) Though yet of Hamlet our dear brother's death The memory be green;[24] and that it us befitted To bear our hearts in grief, and our whole kingdom To be contracted in one brow of woe; Yet so far hath discretion fought with nature, That we with wisest sorrow[25] think on him, Together with remembrance of ourselves. Therefore our sometime sister, now our queen, The imperial jointress of this warlike state, Have we, as 'twere with a defeated joy,[26] Taken to wife: nor have we herein barr'd[27] Your better wisdoms, which have freely gone With this affair along:--For all, our thanks. And now, Laertes, what's the news with you? You told us of some suit; What is't, Laertes?

Laer. (R.) My dread lord, Your leave and favour[28] to return to France; From whence though willingly I came to Denmark, To show my duty in your coronation, Yet now, I must confess, that duty done, My thoughts and wishes bend again toward France, And bow them to your gracious leave and pardon.

King. Have you your father's leave? What says Polonious?

Pol. (R.) He hath, my lord, (wrung from me my slow leave By laboursome petition; and, at last, Upon his will I sealed my hard consent):[29] I do beseech you, give him leave to go.

King. Take thy fair hour, Laertes; time be thine, And thy best graces spend it at thy will![30] But now, my cousin Hamlet, and my son,----

Ham. (L.) A little more than kin, and less than kind.[31]

[Aside.]

King. How is it that the clouds still hang on you?

Ham. Not so, my lord; I am too much i'the sun.[32]

Queen.(L.C.) Good Hamlet, cast thy nighted colour[33] off, And let thine eye look like a friend on Denmark. Do not for ever with thy vailed lids[34] Seek for thy noble father in the dust: Thou know'st 'tis common, all that live must die, Passing through nature to eternity.

Ham. Ay, madam, it is common.

Queen. If it be, Why seems it so particular with thee?

Ham. Seems, madam! nay, it is; I know not seems. 'Tis not alone my inky cloak, good mother, Nor the dejected haviour of the visage, No, nor the fruitful river in the eye, Together with all forms, modes, shows of grief, That can denote me truly: These, indeed, seem, For they are actions that a man might play. But I have that within which passeth show;[35] These but the trappings[36] and the suits of woe.

King. 'Tis sweet and commendable in your nature, Hamlet, To give these mourning duties to your father: But, you must know, your father lost a father; That father lost, lost his;[37] and the survivor bound, In filial obligation, for some term To do obsequious sorrow:[38] But to perséver[39] In obstinate condolement,[40] is a course Of impious stubbornness; 'tis unmanly grief: It shows a will most incorrect to Heaven.[41] We pray you, throw to earth This unprevailing[42] woe; and think of us As of a father: for let the world take note, You are the most immediate to our throne; Our chiefest courtier, cousin, and our son.

Queen. Let not thy mother lose her prayers, Hamlet: I pray thee, stay with us; go not to Wittenberg.

Ham. I shall in all my best obey you, madam.

King. Why, 'tis a loving and a fair reply; Be as ourself in Denmark.--Madam, come; This gentle and unforc'd accord of Hamlet Sits smiling to my heart:[43] in grace whereof,[44] No jocund health that Denmark drinks to-day,[45] But the great cannon to the clouds shall tell; Re-speaking earthly thunder.

[_Trumpet March repeated. Exeunt_ KING _and_ QUEEN, _preceded by_ POLONIUS, Lords, Ladies, LAERTES, _and_ Attendants, R.H.]

Ham. O, that this too, too solid flesh would melt, Thaw, and resolve itself[46] into a dew! Or that the Everlasting had not fix'd His canon[47] 'gainst self-slaughter! O God! O God! How weary, stale, flat, and unprofitable Seem to me all the uses of this world![48] Fye on't! O fye! 'tis an unweeded garden, That grows to seed; things rank and gross in nature Possess it merely.[49] That it should come to this! But two months dead!--nay, not so much, not two: So excellent a king; that was, to this, Hyperion to a satyr:[50] so loving to my mother, That he might not beteem[51] the winds of heaven Visit her face too roughly. Heaven and earth! Must I remember? why, she would hang on him, As if increase of appetite had grown By what it fed on: And yet, within a month,-- Let me not think on't,--Frailty, thy name is Woman!-- A little month; or ere those shoes were old With which she follow'd my poor father's body, Like Niobe, all tears;--she married with my uncle, My father's brother; but no more like my father Than I to Hercules. It is not, nor it cannot come to, good: But break, my heart, for I must hold my tongue!

Enter HORATIO, BERNARDO, _and_ MARCELLUS (R.H.)

Hor. Hail to your lordship!

Ham. I am glad to see you well: Horatio,--or I do forget myself.

Hor. The same, my lord, and your poor servant ever.

Ham. Sir, my good friend; I'll change that name with you:[52] And what make you from Wittenberg, Horatio?-- Marcellus?

[_Crosses to_ C.]

Mar. (R.) My good lord,

Ham. (C.) I am very glad to see you; good even, sir.

[_To_ BERNARDO, R.]

But what, in faith,[53] make you[54] from Wittenberg?[55]

Hor. (L.) A truant disposition, good my lord.

Ham. I would not hear your enemy say so; Nor shall you do mine ear that violence, To make it truster of your own report Against yourself: I know you are no truant. But what is your affair in Elsinore? We'll teach you to drink deep, ere you depart.

Hor. My lord, I came to see your father's funeral.

Ham. I pray thee, do not mock me, fellow-student; I think it was to see my mother's wedding.

Hor. Indeed, my lord, it followed hard upon.

Ham. Thrift, thrift, Horatio! the funeral bak'd meats Did coldly furnish forth the marriage tables. Would I had met my dearest foe[56] in Heaven Ere ever I had seen that day, Horatio! My father,--Methinks, I see my father.

Hor. Where, My lord?

Ham. In my mind's eye, Horatio.

Hor. I saw him once; he was a goodly king.[57]

Ham. He was a man, take him for all in all, I shall not look upon his like again.

[_Crosses to_ L.]

Hor. (C.) My lord, I think I saw him yesternight.

Ham. Saw who?

Hor. My lord, the king your father.

Ham. The king my father!

Hor. Season your admiration for a while[58] With an attent ear; till I may deliver, Upon the witness of these gentlemen, This marvel to you.

Ham. For Heaven's love, let me hear.

Hor. Two nights together had these gentlemen, Marcellus and Bernardo, on their watch, In the dead waste and middle of the night,[59] Been thus encounter'd. A figure like your father, Arm'd at all points exactly, cap-à-pé, Appears before them, and, with solemn march Goes slow and stately by them: thrice he walk'd By their oppress'd and fear-surprisèd eyes, Within his truncheon's length; whilst they, distill'd Almost to jelly with the act of fear,[60] Stand dumb, and speak not to him. This to me In dreadful secrecy impart they did; And I with them the third night kept the watch: Where, as they had deliver'd, both in time, Form of the thing, each word made true and good, The apparition comes.

Ham. But where was this?

[_Crosses to_ MARCELLUS.]

Mar. (R.) My lord, upon the platform where we watch'd.

Ham. (C.) Did you not speak to it?

Hor. (L.) My lord, I did; But answer made it none: yet once methought It lifted up its head, and did address[61] Itself to motion, like as it would speak: But, even then, the morning cock crew loud, And at the sound it shrunk in haste away; And vanish'd from our sight.

Ham. 'Tis very strange.

Hor. As I do live, my honour'd lord, 'tis true; And we did think it writ down[62] in our duty To let you know of it.

Ham. Indeed, indeed, sirs, but this troubles me. Hold you the watch to-night?

Mar. We do, my lord.

Ham. Arm'd, say you?

Mar. Arm'd, my lord.

Ham. From top to toe?

Mar. My lord, from head to foot.

Ham. Then saw you not His face?

Hor. O, yes, my lord; he wore his beaver up.[63]

Ham. What, looked he frowningly?

Hor. A countenance more In sorrow than in anger.

Ham. Pale or red?

Hor. Nay, very pale.

Ham. And fix'd his eyes upon you?

Hor. Most constantly.

Ham. I would I had been there.

Hor. It would have much amaz'd you.

Ham. Very like, Very like. Stay'd it long?

Hor. While one with moderate haste might tell a hundred.

Mar.} } Longer, Longer. _Ber._}

Hor. Not when I saw it.

Ham. His beard was grizzl'd, No?

Hor. It was, as I have seen it in his life, A sable silver'd.

Ham. I will watch to-night; Perchance, 'twill walk again.

Hor. (C.) I warrant it will.

Ham. If it assume my noble father's person, I'll speak to it, though hell itself should gape, And bid me hold my peace.

[_Crosses to_ L.] I pray you all, If you have hitherto conceal'd this sight, Let it be tenable[64] in your silence still; And whatsoever else shall hap to-night, Give it an understanding, but no tongue; I will requite your loves. So, fare you well: Upon the platform, 'twixt eleven and twelve, I'll visit you.

Hor. (R.) Our duty to your honour.

Ham. Your loves, as mine to you: Farewell.

[_Exeunt_ HORATIO, MARCELLUS, _and_ BERNARDO, R.H.]

My father's spirit in arms! all is not well; I doubt some foul play: 'would the night were come; Till then sit still, my soul: Foul deeds will rise, Though all the earth o'erwhelm them, to men's eyes. [_Exit_, L.H.]

SCENE III.--A ROOM IN POLONIUS'S HOUSE.

Enter LAERTES _and_ OPHELIA (R.H.)

Laer. (L.C.) My necessaries are embarked: farewell: And, sister, as the winds give benefit,[65] Let me hear from you.

Oph. (R.C.) Do you doubt that?

Laer. For Hamlet, and the trifling of his favour,[66] Hold it a fashion, and a toy in blood; A violet in the youth of primy nature, Forward, not permanent, sweet, not lasting, The pérfume and suppliance of a minute.[67]

Oph. No more but so?

Laer. He may not, as unvalued persons do, Carve for himself; for on his choice depends The safety and the health of the whole state. Then weigh what loss your honour may sustain, If with too credent ear you list his songs. Fear it, Ophelia, fear it, my dear sister; And keep within the rear of your affection,[68] Out of the shot and danger of desire. The chariest maid[69] is prodigal enough, If she unmask her beauty to the moon: Virtue itself scapes not calumnious strokes: Be wary, then; best safety lies in fear: Youth to itself rebels, though none else near.

Oph. I shall the effect of this good lesson keep, As watchman to my heart. But, good my brother, Do not, as some ungracious pastors do, Show me the steep and thorny way to heaven Whilst, like a puff'd and reckless libertine,[70] Himself the primrose path of dalliance treads, And recks not his own read.[71]

Laer. O, fear me not. I stay too long;--but here my father comes.

Enter POLONIUS (L.H.)

Pol. Yet here, Laertes! aboard, aboard, for shame! The wind sits in the shoulder of your sail,[72] And you are staid for. There,--my blessing with you!

[_Laying his hand on_ LAERTES' _head_.]

And these few precepts in thy memory-- Look thou charácter.[73] Give thy thoughts no tongue, Nor any unproportion'd thought[74] his act. Be thou familiar, but by no means vulgar. The friends thou hast, and their adoption tried, Grapple them to thy soul with

hooks of steel; But do not dull thy palm with entertainment Of each new-hatch'd, unfledg'd comrade. Beware Of entrance to a quarrel; but being in, Bear it, that the opposer may beware of thee. Give every man thine ear, but few thy voice: Take each man's censure,[75] but reserve thy judgment. Costly thy habit as thy purse can buy, But not express'd in fancy; rich, not gaudy: For the apparel oft proclaims the man; And they in France of the best rank and station Are most select and generous, chief in that.[76] Neither a borrower nor a lender be: For loan oft loses both itself and friend; And borrowing dulls the edge of husbandry.[77] This above all,--To thine ownself be true; And it must follow, as the night the day, Thou canst not then be false to any man. Farewell; my blessing season this in thee![78]

Laer. Most humbly do I take my leave, my lord.

[_Crosses to_ L.]

Farewell, Ophelia; and remember well What I have said to you.

Oph. (_Crosses to_ LAERTES.) 'Tis in my memory lock'd, And you yourself shall keep the key of it.[79]

Laer. Farewell.

[_Exit_ LAERTES, L.H.]

Pol. What is it, Ophelia, he hath said to you?

Oph. So please you, something touching the lord Hamlet.

Pol. Marry, well bethought: 'Tis told me, he hath very oft of late Given private time to you;[80] and you yourself Have of your audience been most free and bounteous: If it be so (as so 'tis put on me,[81] And that in way of caution), I must tell you, You do not understand yourself so clearly As it behoves my daughter, and your honour. What is between[82] you? give me up the truth.

Oph. He hath, my lord, of late, made many tenders Of his affection to me.

Pol. Affection! pooh! you speak like a green girl, Unsifted[83] in such perilous circumstance. Do you believe his tenders, as you call them?

Oph. I do not know, my lord, what I should think.

Pol. Marry, I'll teach you: think yourself a baby; That you have ta'en these tenders for true pay, Which are not sterling. Tender yourself more dearly; Or, you'll tender me a fool.

Oph. My lord, he hath impórtun'd me with love In honourable fashion.

Pol. Ay, fashion you may call it; go to, go to.

Oph. And hath given countenance to his speech, my lord, With almost all the holy vows of heaven.

Pol. Ay, springes to catch woodcocks.[84] I do know, When the blood burns, how prodigal the soul Lends the tongue vows: This is for all,-- I would not, in plain terms, from this time forth, Have you so slander any leisure moment,[85] As to give words or talk with the lord Hamlet. Look to't, I charge you: come your ways.

Oph. I shall obey, my lord.

[_Exeunt_, R.H.]

SCENE IV.--THE PLATFORM. NIGHT.

Enter HAMLET, HORATIO, _and_ MARCELLUS (L.H.U.E.)

Ham. The air bites shrewdly; it is very cold.

Hor. It is a nipping and an eager air.[86]

Ham. What hour now?

Hor. I think it lacks of twelve.

Mar. No, it is struck.

Hor. (R.C.) Indeed? I heard it not: then it draws near the season, Wherein the spirit held his wont to walk.

[_A Flourish of Trumpets, and Ordnance shot off without._]

What does this mean, my lord?

Ham. (L.C.) The king doth wake to-night,[87] and takes his rouse,[88] And, as he drains his draughts of Rhenish down, The kettle-drum and trumpet thus bray out The triumph of his pledge.

Hor. Is it a custom?

Ham. Ay, marry, is't:

[_Crosses to_ HORATIO.]

But to my mind,--though I am native here, And to the manner born,--it is a custom More honour'd in the breach than the observance.

Enter Ghost (L.H.)

Hor. (R.H.) Look, my lord, it comes!

Ham. (C.) Angels and ministers of grace defend us!-- Be thou a spirit of health or goblin damn'd, Bring with thee airs from heaven or blasts from hell, Be thy intents wicked or charitable, Thou com'st in such a questionable shape,[89] That I will speak to thee: I'll call thee--Hamlet, King, father: Royal Dane: O, answer me! Let me not burst in ignorance; but tell Why thy canoniz'd bones, hearsed in death,[90] Have burst their cerements;[91] why the sepulchre, Wherein we saw thee quietly in-urn'd, Hath op'd his ponderous and marble jaws, To cast thee up again! What may this mean, That thou, dead corse, again, in cómplete steel, Revisits thus the glimpses of the moon, Making night hideous; and we fools of nature[92] So horridly to shake our disposition[93] With thoughts beyond the reaches of our souls? Say, why is this? wherefore? what should we do?

[Ghost _beckons._]

Hor. It beckons you to go away with it, As if it some impartment did desire To you alone.

[Ghost _beckons again._]

Mar. Look, with what courteous action It waves you to a more removèd ground:[94] But do not go with it.

Hor. No, by no means.

Ham. It will not speak; then I will follow it.

Hor. Do not, my lord.

Ham. Why, what should be the fear? I do not set my life at a pin's fee;[95] And for my soul, what can it do to that, Being a thing immortal as itself?

[Ghost _beckons._]

It waves me forth again;--I'll follow it.

Hor. What if it tempt you toward the flood, my lord,[96] Or to the dreadful summit of the cliff That beetles o'er his base into the sea,[97] And there assume some other horrible form, And draw you into madness?

[Ghost _beckons._]

Ham. It waves me still.-- Go on; I'll follow thee.

Mar. You shall not go, my lord.

Ham. Hold off your hands.

Hor. Be rul'd; you shall not go.

Ham. My fate cries out, And makes each petty artery in this body As hardy as the Némean lion's nerve.[98]

[Ghost _beckons_]

Still am I call'd:--unhand me, gentlemen;

[_Breaking from them._]

By heaven, I'll make a ghost of him that lets me:--[99] I say, away!--Go on; I'll follow thee.

[_Exeunt_ Ghost _and_ HAMLET, L.H., _followed at a distance by_ HORATIO _and_ MARCELLUS.]

SCENE V.--A MORE REMOTE PART OF THE PLATFORM. NIGHT.

Re-enter Ghost _and_ HAMLET (L.H.U.E.)

Ham. (R.) Whither wilt thou lead me? Speak; I'll go no further.

Ghost. (L.) Mark me.

Ham. I will.

Ghost. My hour is almost come, When I to sulphurous and tormenting flames Must render up myself.

Ham. Alas, poor ghost!

Ghost. Pity me not, but lend thy serious hearing To what I shall unfold.

Ham. Speak; I am bound to hear.

Ghost. So art thou to revenge, when thou shalt hear.

Ham. What?

Ghost. I am thy father's spirit; Doom'd for a certain term to walk the night, And for the day confin'd to fast in fires,[100] Till the foul crimes done in my days of nature Are burnt and purg'd away. But that I am forbid To tell the secrets of my prison-house, I could a tale unfold, whose lightest word Would harrow up thy soul;[101] freeze thy young blood; Make thy two eyes, like stars, start from their spheres; Thy knotted and combinèd locks to part, And each particular hair to stand on end,[102] Like quills upon the fretful porcupine:[103] But this eternal blazon[104] must not be To ears of flesh and blood.--List, list, O, list!-- If thou didst ever thy dear father love,----

Ham. O Heaven!

Ghost. Revenge his foul and most unnatural murder.

Ham. Murder!

Ghost. Murder most foul, as in the best it is; But this most foul, strange, and unnatural.

Ham. Haste me to know it, that I, with wings as swift As meditation or the thoughts of love, May sweep to my revenge.

Ghost. I find thee apt; And duller shouldst thou be than the fat weed That rots itself in ease on Lethe wharf,[105] Wouldst thou not stir in this. Now, Hamlet, hear: 'Tis given out that, sleeping in mine orchard,[106] A serpent stung me; so the whole ear of Denmark Is by a forged process[107] of my death Rankly abus'd: but know, thou noble youth, The serpent that did sting thy father's life Now wears his crown.

Ham. O, my prophetic soul! my uncle!

Ghost. Ay, that incestuous, that adulterate beast, With witchcraft of his wit, with traitorous gifts, Won to his shameful lust The will of my most seeming virtuous queen: O, Hamlet, what a falling-off was there! From me, whose love was of that dignity, That it went hand in hand even with the vow I made to her in marriage; and to decline Upon a wretch,[108] whose natural gifts were poor To

those of mine! But, soft! methinks I scent the morning air; Brief let me be.--Sleeping within mine orchard, My custom always in the afternoon, Upon my secure[109] hour thy uncle stole, With juice of cursed hebenon[110] in a vial, And in the porches of mine ears did pour The leperous distilment; whose effect Holds such an enmity with blood of man, That, swift as quicksilver, it courses through The natural gates and alleys of the body; So did it mine; Thus was I, sleeping, by a brother's hand Of life, of crown, of queen, at once despatch'd:[111] Cut off even in the blossoms of my sin, Unhousel'd, disappointed, unanel'd;[112] No reckoning made, but sent to my account With all my imperfections on my head.

Ham. O, horrible! O, horrible! most horrible!

Ghost. If thou hast nature in thee, bear it not; Let not the royal bed of Denmark be A couch for luxury[113] and damnèd incest. But, howsoever thou pursu'st this act, Taint not thy mind, nor let thy soul contrive Against thy mother aught: leave her to Heaven, And to those thorns that in her bosom lodge, To prick and sting her. Fare thee well at once! The glow-worm shows the matin to be near, And 'gins to pale his ineffectual fire:[114] Adieu, adieu, adieu! remember me.

[_Exit_, L.H.]

Ham. Hold, hold, my heart; And you, my sinews, grow not instant old, But bear me stiffly up.--Remember thee! Ay, thou poor ghost, while memory holds a seat In this distracted globe.[115] Remember thee! Yea, from the table of my memory I'll wipe away all forms, all pressures past,[116] And thy commandment all alone shall live Within the book and volume of my brain, Unmix'd with baser matter: yes, by heaven, I have sworn't.

Hor. (_Without._) My lord, my lord,----

Mar. (_Without._) Lord Hamlet,----

Hor. (_Without._) Heaven secure him!

Ham. So be it!

Mar. (_Without._) Illo, ho, ho, my lord!

Ham. Hillo, ho, ho, boy! come, bird, come.[117]

Enter HORATIO _and_ MARCELLUS (L.H.U.E.)

Mar. (R.) How is't, my noble lord?

Hor. (L.) What news, my lord?

Ham. (C.) O, wonderful!

Hor. Good my lord, tell it.

Ham. No; You will reveal it.

Hor. Not I, my lord, by heaven.

Mar. Nor I, my lord.

Ham. How say you, then; would heart of man once think it? But you'll be secret?--

Hor.} } Ay, by heaven, my lord. _Mar._}

Ham. There's ne'er a villain, dwelling in all Denmark-- But he's an arrant knave.[118]

Hor. There needs no ghost, my lord, come from the grave To tell us this.

Ham. Why, right; you are in the right; And so, without more circumstance at all, I hold it fit that we shake hands, and part: You as your business and desire shall point you, For every man hath business and desire, Such as it is;--and, for my own poor part, Look you, I will go pray.

Hor. These are but wild and whirling words,[119] my lord.

Ham. I am sorry they offend you, heartily.

Hor. There's no offence, my lord.

Ham. Yes, by Saint Patrick,[120] but there is, Horatio, And much offence, too. Touching this vision here, It is an honest ghost, that let me tell you: For your desire to know what is between us, O'er-master it[121] as you may. And now, good friends, As you are friends, scholars, and soldiers, Give me one poor request.

Hor. What is't, my lord? We will.

Ham. Never make known what you have seen to-night.

Hor.} } My lord, we will not. _Mar._}

Ham. Nay, but swear't.

Hor. Propose the oath, my lord.

Ham. Never to speak of this that you have seen. Swear by my sword.

[HORATIO _and_ MARCELLUS _place each their right hand on_ HAMLET'S _sword._]

Ghost. (_Beneath._) Swear.

Hor. O day and night, but this is wondrous strange!

Ham. And therefore as a stranger give it welcome.[122] There are more things in heaven and earth, Horatio, Than are dreamt of in your philosophy. But come;-- Here, as before, never, so help you mercy, How strange or odd soe'er I bear myself, As I, perchance, hereafter shall think meet To put an antick disposition[123] on,-- That you, at such times seeing me, never shall, With arms encumber'd thus,[124] or this head-shake, Or by pronouncing of some doubtful phrase, As, _Well, we know_; or, _We could, an if we would_; or, _If we list to speak_;--or, _There be, an if they might_;-- Or such ambiguous giving out, to note That you know aught of me:--This do you swear, So grace and mercy at your most need help you!

[HORATIO _and_ MARCELLUS _again place their hands on_ HAMLET'S _sword._]

Ghost. (_Beneath._) Swear.

Ham. Rest, rest, perturbed spirit! So gentlemen, With all my love I do commend me to you: And what so poor a man as Hamlet is May do, to express his love and friending to you, Heaven willing, shall not lack.[125] Let us go in together;

[_Crosses to_ L.]

And still your fingers on your lips, I pray. The time is out of joint;--O cursèd spite, That ever I was born to set it right! Nay, come, let's go together.

[_Exeunt_ L.H.]

END OF ACT FIRST.

Notes

Act I

[Footnote I.1: _Me:_] _i.e., me_ who am already on the watch, and have a right to demand the watch-word.]

[Footnote I.2: _Unfold_] Announce, make known.]

[Footnote I.3: _Long live the King._] The watch-word.]

[Footnote I.4: _The rivals of my watch_,] _Rivals_, for partners or associates.]

[Footnote I.5: _And liegemen to the Dane._] _i.e._, owing allegiance to Denmark.]

[Footnote I.6: _A piece of him._] Probably a cant expression.]

[Footnote I.7: _To watch the minutes of this night_; This seems to have been an expression common in Shakespeare's time.]

[Footnote I.8: _Approve our eyes_,] To _approve_, in Shakespeare's age, signified to make good or establish.]

[Footnote I.9: _What we have seen._] We must here supply "with," or "by relating" before "what we have seen."]

[Footnote I.10: _It harrows me with fear and wonder._] _i.e._, it confounds and overwhelms me.]

[Footnote I.11: _Usurp'st this time of night_,] _i.e._, abuses, uses against right, and the order of things.]

[Footnote I.12: _I might not this believe, &c._] I _could_ not: it had not been permitted me, &c., without the full and perfect evidence, &c.]

[Footnote I.13: _Jump at this dead hour_,] _Jump_ and _just_ were synonymous in Shakespeare's time.]

[Footnote I.14: _In what particular thought to work_,] In what particular course to set my thoughts at work: in what particular train to direct the mind and exercise it in conjecture.]

[Footnote I.15: _Gross and scope_] Upon the whole, and in a general view.]

[Footnote I.16: _Bodes some strange eruption to our state_,] _i.e._, some political distemper, which will break out in dangerous consequences.]

[Footnote I.17: _Palmy state_] Outspread, flourishing. Palm branches were the emblem of victory.]

[Footnote I.18: _Sound, or use of voice_,] Articulation.]

[Footnote I.19:

Uphoarded in thy life Extorted treasure in the womb of earth,]

So in Decker's Knight's Conjuring, &c. "If any of them had bound the spirit of gold by any charmes _in cares_, or in iron fetters, _under the ground_, they should, _for their own soule's quiet (which, questionless, else would whine up and down_,) not for the good of their children, release it."]

[Footnote I.20:

And then it started like a guilty thing Upon a fearful summons.]

Apparitions were supposed to fly from the crowing of the cock, because it indicated the approach of day.]

[Footnote I.21: _Lofty_] High and loud.]

[Footnote I.22: _The extravagant and erring spirit_] _Extravagant_ is, got out of his bounds. _Erring_ is here used in the sense of wandering.]

[Footnote I.23: Laertes is unknown in the original story, being an introduction of Shakespeare's.]

[Footnote I.24: _Green_;] Fresh.]

[Footnote I.25: _Wisest sorrow_] Sober grief, passion discreetly reined.]

[Footnote I.26: _With a defeated joy_,] _i.e._, with joy baffled; with joy interrupted by grief.]

[Footnote I.27: _Barr'd_] Excluded--acted without the concurrence of.]

[Footnote I.28: _Your leave and favour_] The favour of your leave granted, the kind permission. Two substantives with a copulative being here, as is the frequent practice of our author, used for an adjective and substantive: an adjective sense is given to a substantive.]

[Footnote I.29: _Upon his will I sealed my hard consent:_] At or upon his earnest and importunate suit, I gave my full and final, though hardly obtained and reluctant, consent.]

[Footnote I.30:

Take thy fair hour! time be thine; And thy best graces spend it at thy will!]

Catch the auspicious moment! be time thine own! and may the exercise of thy fairest virtue fill up those hours, that are wholly at your command!]

[Footnote I.31: _A little more than kin, and less than kind._] Dr. Johnson says that _kind_ is the Teutonic word for _child_. Hamlet, therefore, answers to the titles of _cousin_ and _son_, which the king had given him, that he was somewhat more than _cousin_, and less than _son_. Steevens remarks, that it seems to have been another proverbial phrase: "The nearer we are in blood, the further we must be from love; the greater the _kindred_ is, the less the _kindness_ must be." _Kin_ is still used in the Midland Counties for _cousin_, and _kind_ signifies _nature_. Hamlet may, therefore, mean that the relationship between them had become _unnatural_.]

[Footnote I.32: _I am too much i'the sun._] Meaning, probably, his being sent for from his studies to be exposed at his uncle's marriage as his _chiefest courtier_, and being thereby placed too much in the radiance of the king's presence; or, perhaps, an allusion to the proverb, "_Out of Heaven's blessing, into the warm sun:_" but it is not unlikely that a quibble is meant between _son_ and _sun_.]

[Footnote I.33: _Nighted colour_] Black--night-like.]

[Footnote I.34: _Vailed lids_] Cast down.]

[Footnote I.35: _Which passeth show_;] _i.e._, "external manners of lament."]

[Footnote I.36: _Trappings_] _Trappings_ are "furnishings."]

[Footnote I.37: _That father lost, lost his_;] "That lost father (of your father, _i.e._, your grandfather), or father so lost, lost his.]"

[Footnote I.38: _Do obsequious sorrow:_] Follow with becoming and ceremonious observance the memory of the deceased.]

[Footnote I.39: _But to persév_er_] This word was anciently accented on the second syllable.]

[Footnote I.40: _Obstinate condolement_,] Ceaseless and unremitted expression of grief.]

[Footnote I.41: _Incorrect to Heaven._] Contumacious towards Heaven.]

[Footnote I.42: _Unprevailing_] Fruitless, unprofitable.]

[Footnote I.43: _Sits smiling to my heart:_] _To_ is _at_: gladdens my heart.]

[Footnote I.44: _In grace whereof_,] _i.e._, respectful regard or honour of which.]

[Footnote I.45: _No jocund health, that Denmark drinks to-day_,] Dr. Johnson remarks, that the king's intemperance is very strongly impressed; everything that happens to him gives him occasion to drink. The Danes were supposed to be hard drinkers.]

[Footnote I.46: _Resolve itself_] _To resolve_ is an old word signifying _to dissolve_.]

[Footnote I.47: _His canon_] _i.e._, his rule or law].

[Footnote I.48: _The uses of this world!_] _i.e._, the habitudes and usages of life.]

[Footnote I.49: _Merely._] Wholly--entirely.]

[Footnote I.50: _Hyperion to a satyr:_] An allusion to the exquisite beauty of Apollo, compared with the deformity of a satyr; that satyr, perhaps, being Pan, the brother of Apollo. Our great poet is here guilty of a false quantity, by calling Hyp■r■on, Hyp■r■on, a mistake not unusual among our English poets.]

[Footnote I.51: _Might not beteem_] _i.e._, might not allow, permit.]

[Footnote I.52: _I'll change that name with you._] _i.e._, do not call yourself my _servant_, you are my _friend_; so I shall call you, and so I would have you call me.]

[Footnote I.53: _In faith._] Faithfully, in pure and simple verity.]

[Footnote I.54: _But what make you_] What is your object? What are you doing?]

[Footnote I.55: _What, in faith, make you from Wittenberg?_] In Shakespeare's time there was a university at Wittenberg; but as it was not founded till 1502, it consequently did not exist in the time to which this play refers.]

[Footnote I.56: _My dearest foe_] _i.e._, my direst or most important foe. This epithet was commonly used to denote the strongest and liveliest interest in any thing or person, for or against.]

[Footnote I.57: _Goodly king._] _i.e._, a good king.]

[Footnote I.58:

Season your admiration for a while with an attent ear;]

_i.e._, suppress your astonishment for a short time, that you may be the better able to give your attention to what we will relate.]

[Footnote I.59: _In the dead waste and middle of the night_,] _i.e._, in the dark and desolate vast, or vacant space and middle of the night. It was supposed that spirits had permission to range the earth by night alone.]

[Footnote I.60: _With the act of fear_,] _i.e._, by the influence or power of fear.]

[Footnote I.61: _Address_] _i.e._, make ready.]

[Footnote I.62: _Writ down_] Prescribed by our own duty.]

[Footnote I.63: _He wore his beaver up._] That part of the helmet which may be lifted up, to take breath the more freely.]

[Footnote I.64: _Tenable_] _i.e._, strictly maintained.]

[Footnote I.65: _Benefit_,] Favourable means.]

[Footnote I.66: _Trifling of his favour_,] Gay and thoughtless intimation.]

[Footnote I.67: _Pérfume and suppliance of a minute._] _i.e._, an amusement to fill up a vacant moment, and render it agreeable.]

[Footnote I.68: _Keep within the rear of your affection_,] Front not the peril; withdraw or check every warm emotion: advance not so far as your affection would lead you.]

[Footnote I.69: _The chariest maid_] Chary is cautious.]

[Footnote I.70: _Puff'd and reckless libertine._] Bloated and swollen, the effect of excess; and heedless and indifferent to consequences.]

[Footnote I.71: _Recks not his own read._] _i.e._, heeds not his own lessons or counsel.]

[Footnote I.72: _Shoulder of your sail_,] A common sea phrase.]

[Footnote I.73: _Look thou charácter._] _i.e._, a word often used by Shakespeare to signify to _write, strongly infix_; the accent is on the second syllable.]

[Footnote I.74: _Unproportion'd thought_] Irregular, disorderly thought.]

[Footnote I.75: _Each man's censure_,] Sentiment, opinion.]

[Footnote I.76: _Chief in that._] _i.e._, chiefly in that.]

[Footnote I.77: _Husbandry_] _i.e._, thrift, economical prudence.]

[Footnote I.78: _Season this in thee!_] _i.e._, infix it in such a manner as that it may never wear out.]

[Footnote I.79: _Yourself shall keep the key of it._] Thence it shall not be dismissed, till you think it needless to retain it.]

[Footnote I.80: _Given private time to you_;] Spent his time in private visits to you.]

[Footnote I.81: _As so 'tis put on me_,] Suggested to, impressed on me.]

[Footnote I.82: _Is between_] _i.e._, what has passed--what intercourse had.]

[Footnote I.83: _Green girl, Unsifted_] _i.e._, inexperienced girl. Unsifted means one who has not nicely _canvassed_ and examined the peril of her situation.]

[Footnote I.84: _Woodcocks._] Witless things.]

[Footnote I.85: _Slander any leisure moment_,] _i.e._, I would not have you so disgrace your most idle moments, as not to find better employment for them than lord Hamlet's conversation.]

[Footnote I.86: _An eager air._] _Eager_ here means _sharp_, from _aigre_, French.]

[Footnote I.87: _Doth wake to-night_,] _i.e._, holds a late revel.]

[Footnote I.88: _Takes his rouse_,] _Rouse_ means drinking bout, carousal.]

[Footnote I.89: _Questionable shape_,] To _question_, in our author's time, signified to _converse_. Questionable, therefore, means _capable of being conversed with._]

[Footnote I.90: _Hearsed in death_,] Deposited with the accustomed funeral rites.]

[Footnote I.91: _Cerements_;] Those precautions usually adopted in preparing dead bodies for sepulture.]

[Footnote I.92: _Fools of nature_] _i.e._, making sport for nature.]

[Footnote I.93: _Disposition_] Frame of mind and body.]

[Footnote I.94: _Removèd ground:_] _Removed_ for _remote_.]

[Footnote I.95: _At a pin's fee_;] _i.e._, the value of a pin.]

[Footnote I.96: _What if it tempt you toward the flood, &c._] Malignant spirits were supposed to entice their victims into places of gloom and peril, and exciting in them the deepest terror.]

[Footnote I.97: _Beetles o'er his base into the sea_,] _i.e._, projects darkly over the sea.]

[Footnote I.98: _Némean lion's nerve._] Shakespeare, and nearly all the poets of his time, disregarded the quantity of Latin names. The poet has here placed the accent on the first syllable, instead of the second.]

[Footnote I.99: _That lets me:_] To let, in the sense in which it is here used, means to hinder--to obstruct--to oppose. The word is derived from the Saxon.]

[Footnote I.100: _To fast in fires_,] Chaucer has a similar passage with regard to eternal punishment--_"And moreover the misery of Hell shall be in default of meat and drink."_]

[Footnote I.101: _Harrow up thy soul_;] Agitate and convulse.]

[Footnote I.102: _Hair to stand on end_,] A common image of that day.

"_Standing_ as frighted with _erected haire_."]

[Footnote I.103: _The fretful porcupine:_] This animal being considered irascible and timid.]

[Footnote I.104: _Eternal blazon_] _i.e._, publication or divulgation of things eternal.]

[Footnote I.105: _Rots itself in ease on Lethe wharf_,] _i.e._, in indolence and sluggishness, by its torpid habits contributes to that morbid state of its juices which may figuratively be denominated rottenness.]

[Footnote I.106: _Orchard_,] Garden.]

[Footnote I.107: _Forged process_] _i.e._, false report of proceedings.]

[Footnote I.108: _Decline upon a wretch._] Stoop with degradation to.]

[Footnote I.109: _Secure_] Unguarded.]

[Footnote I.110: _Hebenon_] Hebenon is described by Nares in his Glossary, as the juice of ebony, supposed to be a deadly poison.]

[Footnote I.111: _Despatch'd:_] Despoiled--bereft.]

[Footnote I.112: _Unhousel'd, disappointed, unanel'd_;] To _housel_ is to minister the sacrament to one lying on his death bed. _Disappointed_ is the same as unappointed, which here means unprepared. _Unanel'd_ is without extreme unction.]

[Footnote I.113: _Luxury_] Lasciviousness.]

[Footnote I.114: _Pale his uneffectual fire:_] _i.e._, not seen by the light of day; or it may mean, shining without heat.]

[Footnote I.115: _In this distracted globe._] _i.e._, his head distracted with thought.]

[Footnote I.116: _Pressures past_,] Impressions heretofore made.]

[Footnote I.117: _Come, bird, come._] This is the call which falconers used to their hawk in the air when they would have him come down to them.]

[Footnote I.118:

There's ne'er a villain dwelling in all Denmark-- But he's an arrant knave.]

Hamlet probably begins these words in the ardour of confidence and sincerity; but suddenly alarmed at the magnitude of the disclosure he was going to make, and considering that, not his friend Horatio only, but another person was present, he breaks off suddenly:--"There's ne'er a villain in all Denmark that can match (perhaps he would have said) my uncle in villainy; but recollecting the danger of such a declaration, he pauses for a moment, and then abruptly concludes:--"but he's an arrant knave."]

[Footnote I.119: _Whirling words_,] Random words thrown out with no specific aim.]

[Footnote I.120: _By Saint Patrick_,] At this time all the whole northern world had their learning from Ireland; to which place it had retired, and there flourished under the auspices of this Saint.]

[Footnote I.121: _O'er-master it_] Get the better of it.]

[Footnote I.122: _Give it welcome._] Receive it courteously, as you would a stranger when introduced.]

[Footnote I.123: _Antick disposition_] _i.e._, strange, foreign to my nature, a disposition which Hamlet assumes as a protection against the danger which he apprehends from his uncle, and as a cloak for the concealment of his own meditated designs.]

[Footnote I.124: _Arms encumber'd thus_,] _i.e._, folded.]

[Footnote I.125: _Friending to you--shall not lack_] Disposition to serve you shall not be wanting.]

ACT II.

SCENE I.--A ROOM IN POLONIUS'S HOUSE.

Enter POLONIUS[1] (L.H.), _meeting Ophelia._ (R.H.)

Pol. How now, Ophelia! What's the matter?

Oph. O, my lord, my lord, I have been so affrighted!

Pol. With what, in the name of Heaven?

Oph. My lord, as I was sewing in my closet, Lord Hamlet, with his doublet all unbrac'd; Pale as his shirt; his knees knocking each other, And with a look so piteous in purport, He comes before me.

Pol. Mad for thy love?

Oph. My lord, I do not know; But, truly, I do fear it.

Pol. What said he?

Oph. He took me by the wrist, and held me hard; Then goes he to the length of all his arm; And, with his other hand thus o'er his brow, He falls to such perusal of my face As he would draw it. Long staid he so; At last,--a little shaking of mine arm, And thrice his head thus waving up and down, He rais'd a sigh so piteous and profound, As it did seem to shatter all his bulk,[2] And end his being: That done, he lets me go: And, with his head over his shoulder turn'd, He seem'd to find his way without his eyes; For out o'doors he went without their helps, And, to the last, bended their light on me.

Pol. Come, go with me; I will go seek the king. This is the very ecstacy of love;[3] What, have you given him any hard words of late?

Oph. No, my good lord; but, as you did command, I did repel his letters, and denied His access to me.

Pol. That hath made him mad. Come, go we to the king: This must be known; which, being kept close, might move More grief to hide than hate to utter love.[4] Come. [_Exeunt_ L.H.]

SCENE II.--A ROOM IN THE CASTLE.

Enter KING, QUEEN, ROSENCRANTZ, GUILDENSTERN, _and_ Attendants (R.H.)

King. (C.) Welcome, dear Rosencrantz and Guildenstern! Moreover that we much did long to see you, The need we have to use you did provoke Our hasty sending. Something have you heard Of Hamlet's transformation. What it should be, More than his father's death, that thus hath put him So much from the understanding of himself,[5] I cannot dream of: I entreat you both, That you vouchsafe your rest[6] here in our court Some little time: so by your companies To draw him on to pleasures, and to gather, Whether aught, to us unknown, afflicts him thus, That, open'd, lies within our remedy.

Queen. (R.C.) Good gentlemen, he hath much talk'd of you; And sure I am two men there are not living To whom he more adheres. If it will please you So to expend your time with us a while, Your visitation shall receive such thanks As fits a king's remembrance.

Ros. (R.) Both your majesties Might, by the sovereign power you have of us,[7] Put your dread pleasures more into command Than to entreaty.

Guil. (R.) But we both obey, And here give up ourselves, in the full bent,[8] To lay our service freely at your feet.

King. Thanks, Rosencrantz and gentle Guildenstern.

Queen. I do beseech you instantly to visit My too much changèd son. Go, some of you, And bring these gentlemen where Hamlet is. [_Exeunt_ ROSENCRANTZ, GUILDENSTERN, _and_ Attendants, R.H.]

Enter POLONIUS (L.H.)

Pol. Now do I think (or else this brain of mine Hunts not the trail of policy[9] so sure As it hath us'd to do), that I have found The very cause of Hamlet's lunacy.

King. (C.) O, speak of that; that do I long to hear.

Pol. (L.C.) My liege, and madam, to expostulate[10] What majesty should be, what duty is, Why day is day, night night, and time is time, Were nothing but to waste night, day, and time; Therefore, since brevity is the soul of wit, And tediousness the limbs and outward flourishes,-- I will be brief:--Your noble son is mad: Mad call I it; for, to define true madness, What is't, but to be nothing else but mad? But let that go.

Queen. (R.C.) More matter, with less art.

Pol. Madam, I swear I use no art at all. That he is mad, 'tis true: 'tis true 'tis pity; And pity 'tis, 'tis true: a foolish figure; But farewell it, for I will use no art. Mad let us grant him, then: and now remains That we find out the cause of this effect, Or, rather say, the

cause of this defect, For this effect defective comes by cause: Thus it remains, and the remainder thus, Perpend.[11] I have a daughter, have, while she is mine, Who, in her duty and obedience, mark, Hath given me this: Now gather, and surmise.

[Reads] _To the celestial, and my soul's idol, the most beautified Ophelia,--_[12]

That's an ill phrase, a vile phrase, _beautified_ is a vile phrase: but you shall hear. Thus:

In her excellent white bosom,[13] these, &c.[14]

Queen. Came this from Hamlet to her?

Pol. Good madam, stay awhile; I will be faithful.-- [_Reads._]

Doubt thou the stars are fire; _Doubt thou the sun doth move;_ _Doubt truth to be a liar;_ _But never doubt, I love._

O dear Ophelia, I am ill at these numbers;[15] I have not art to reckon my groans: but that I love thee best, O most best,[16] believe it. Adieu.

Thine evermore, most dear lady, whilst this machine is to him,[17] Hamlet.

This, in obedience, hath my daughter shown me: And more above,[18] hath his solicitings,[19] As they fell out by time, by means, and place, All given to my ear.

King. But how hath she Receiv'd his love?

Pol. What do you think of me?

King. As of a man faithful and honourable.

Pol. I would fain prove so. But what might you think, When I had seen this hot love on the wing (As I perceived it, I must tell you that, Before my daughter told me), what might you, Or my dear majesty your queen here, think, If I had play'd the desk or table book;[20] Or given my heart a winking, mute and dumb;[21] Or look'd upon this love with idle sight;[22] What might you think? No, I went round to work,[23] And my young mistress thus did I bespeak: _Lord Hamlet is a prince, out of thy sphere; This must not be:_ and then I precepts gave her, That she should lock herself from his resort, Admit no messengers, receive no tokens. Which done, she took the fruits of my advice;[24] And he, repuls'd (a short tale to make), Fell into sadness; thence into a weakness; Thence to a lightness; and, by this declension, Into the madness wherein now he raves, And all we mourn for.

King. Do you think 'tis this?

Queen. It may be, very likely.

Pol. Hath there been such a time (I'd fain know that,) That I have positively said, _'tis so_, When it proved otherwise?

King. Not that I know.

Pol. Take this from this, if it be otherwise:

[_Pointing to his head and shoulder._]

If circumstances lead me, I will find Where truth is hid, though it were hid indeed Within the centre.

King. How may we try it further?

Pol. You know, sometimes he walks for hours together Here in the lobby.

Queen. So he does, indeed.

Pol. At such a time I'll loose my daughter to him: Mark the encounter: if he love her not, And be not from his reason fallen thereon, Let me be no assistant for a state, But keep a farm, and carters.

King. We will try it.

Queen. But, look, where sadly the poor wretch comes reading.

Pol. Away, I do beseech you both, away: I'll board him presently.[25]

[_Exeunt_ KING _and_ QUEEN, R.H.]

Enter HAMLET, _reading_ (L.C.)

Pol. How does my good lord Hamlet?

Ham. (C.) Excellent well.

Pol. (R.) Do you know me, my lord?

Ham. Excellent well; you are a fishmonger.[26]

Pol. Not I, my lord.

Ham. Then I would you were so honest a man.

Pol. Honest, my lord!

Ham. Ay, sir; to be honest, as this world goes, is to be one man picked out of ten thousand.

Pol. That's very true, my lord.

Ham. For if the sun breed maggots in a dead dog, being a god, kissing carrion,----Have you a daughter?[27]

Pol. I have, my lord.

Ham. Let her not walk i'the sun: conception is a blessing; but as your daughter may conceive,--friend, look to't, look to't, look to't.

[_Goes up stage._]

Pol. (_Aside._) Still harping on my daughter:--yet he knew me not at first; he said I was a fishmonger.

[_Crosses to_ L.]

I'll speak to him again.--What do you read, my lord?

Ham. (C.) Words, words, words.

Pol. (L.) What is the matter, my lord?

Ham. Between who?

Pol. I mean, the matter that you read, my lord.

Ham. Slanders, sir: for the satirical rogue[28] says here that old men have grey beards; that their faces are wrinkled; their eyes purging thick amber and plum-tree gum; and that they have a plentiful lack of wit, together with most weak hams: All of which, sir, though I most powerfully and potently believe, yet I hold it not honesty to have it thus set down; for yourself, sir, shall be as old as I am, if, like a crab, you could go backward.

[_Crosses_, L.]

Pol. (_Aside._) Though this be madness, yet there's method in it. Will you walk out of the air, my lord?

Ham. Into my grave?

[_Crosses_ R.]

Pol. (L.) Indeed, that is out o' the air.--How pregnant sometimes his replies[29] are! a happiness that often madness hits on, which reason and sanity could not so prosperously be delivered of. I will leave him, and suddenly contrive the means of meeting between him and my daughter.--My honourable lord, I will most humbly take my leave of you.

Ham. (C.) You cannot, sir, take from me any thing that I will more willingly part withall, except my life, except my life, except my life.

Pol. Fare you well, my lord.

[_Exit_ POLONIUS, L.H.]

Ham. These tedious old fools!

Pol. (_Without._) You go to seek the lord Hamlet; there he is.

Ros. Heaven save you, sir!

Enter ROSENCRANTZ _and_ GUILDENSTERN (L.H.)

Guil. My honor'd lord!--

Ros. My most dear lord!--

Ham. My excellent good friends! How dost thou, Guildenstern?

[_Crosses to_ ROSENCRANTZ.]

Ah, Rosencrantz! Good lads, how do ye both? What news?

Ros. (L.) None, my lord, but that the world's grown honest.

Ham. (C.) Then is dooms-day near: but your news is not true. In the beaten way of friendship,[30] what make you at Elsinore?

Ros. To visit you, my lord; no other occasion.

Ham. Beggar that I am, I am even poor in thanks; but I thank you. Were you not sent for? Is it your own inclining? Is it a free visitation? Come, come, deal justly with me: come, come; nay, speak.

Guil. (R.) What should we say, my lord?

Ham. Any thing--but to the purpose. You were sent for; and there is a kind of confession in your looks, which your modesties have not craft enough to colour: I know the good king and queen have sent for you.

Ros. To what end, my lord?

Ham. That you must teach me. But let me conjure you, by the rights of our fellowship, [_taking their hands_,] by the consonancy of our youth,[31] by the obligation of our ever-preserved love, and by what more dear a better proposer[32] could charge you withal, be even[33] and direct with me, whether you were sent for, or no?

Ros. What say you?

[_To_ GUILDENSTERN.]

Ham. Nay, then, I have an eye of you.[34]

[_Crosses_ R.]

[_Aside._]

--if you love me, hold not off.

Guil. My lord, we were sent for.

Ham. (_Returning_ C.) I will tell you why; so shall my anticipation prevent your discovery, and your secrecy to the king and queen moult no feather.[35] I have of late (but wherefore I know not) lost all my mirth, forgone all custom of exercises; and, indeed, it goes so heavily with my disposition, that this goodly frame, the earth, seems to me a steril promontory; this most excellent canopy, the air, look you, this brave o'erhanging firmament, this majestical roof fretted with golden fire, why, it appears no other thing to me than a foul and pestilent congregation of vapours. What a piece of work is man! How noble in reason! how infinite in faculties! in form and moving how express[36] and admirable! in action how like an angel! in apprehension how like a god! the beauty of the world! the paragon[37] of animals! And yet, to me, what is this quintessence of dust? man delights not me,--nor

woman neither, though by your smiling you seem to say so.

Ros. My lord, there was no such stuff in my thoughts.

Ham. Why did you laugh, then, when I said, _Man delights not me?_

Ros. To think, my lord, if you delight not in man, what lenten entertainment[38] the players shall receive from you: we coted them on the way;[39] and hither are they coming, to offer you service.

Ham. He that plays the king shall be welcome, his majesty shall have tribute of me; the adventurous knight shall use his foil and target; the lover shall not sigh gratis; the humorous man shall end his part in peace;[40] and the lady shall say her mind freely, or the blank verse shall halt for't.[41]--What players are they?

Ros. Even those you were wont to take such delight in, the tragedians of the city.

Ham. How chances it, they travel?[42] their residence, both in reputation and profit, was better both ways. Do they hold the same estimation they did when I was in the city? Are they so followed?

Ros. No, indeed, they are not.

Ham. It is not very strange; for my uncle is king of Denmark,[43] and those that would make mouths at him[44] while my father lived, give twenty, forty, fifty, an hundred ducats a-piece for his picture in little.[45] There is something in this more than natural, if philosophy could find it out.

[_Flourish of trumpets without._]

Guil. There are the players.

Ham. Gentlemen, you are welcome to Elsinore. Your hands. You are welcome: but my uncle-father and aunt-mother are deceived.

Guil. In what, my dear lord?

Ham. I am but mad north-north west: when the wind is southerly I know a hawk from a hern-shaw.[46]

[_Crosses_ R.]

Pol. (_Without_, L.H.) Well be with you, gentlemen!

Ham. (_Crosses_ C.) Hark you, Guildenstern;--and Rosencrantz: that great baby you see there is not yet out of his swaddling-clouts.

Ros. (R.) Haply he's the second time come to them; for they say an old man is twice a child.

Ham. I will prophesy he comes to tell me of the players; mark it.--You say right, sir: o'Monday morning; 'twas then, indeed.

Enter POLONIUS (L.H.)

Pol. My lord, I have news to tell you.

Ham. My lord, I have news to tell you. When Roscius was an actor in Rome,----

Pol. The actors are come hither, my lord.

Ham. Buz, buz![47]

Pol. Upon my honour,----

Ham. Then came each actor on his ass.[48]

Pol. The best actors in the world, either for tragedy, comedy, history, pastoral, pastorical-comical, historical-pastoral, scene indivisible, or poem unlimited: Seneca cannot be too heavy, nor Plautus too light.[49] For the law of writ and the liberty, these are the only men.[50]

Ham. _O, Jephthah, judge of Israel_,--what a treasure hadst thou!

Pol. What a treasure had he, my lord?

Ham. Why,--_One fair daughter, and no more, The which he loved passing well._

Pol. Still harping on my daughter.

[_Aside._]

Ham. Am I not i'the right, old Jephthah?

Pol. If you call me Jephthah, my lord, I have a daughter that I love passing well.

Ham. Nay, that follows not.

Pol. What follows, then, my lord?

Ham. Why, _As by lot, God wot_,[51] and then, you know, _It came to pass, As most like it was_,--The first row of the pious Chanson[52] will show you more; for look, my abridgment comes.[53]

Enter Four or Five Players (L.H.)--POLONIUS _crosses behind_ HAMLET _to_ R.H.

You are welcome, masters; welcome, all: O, old friend! Why, thy face is valanced[54] since I saw thee last; Com'st thou to beard me[55] in Denmark?--What, my young lady and mistress. By-'r-lady, your ladyship is nearer to heaven than when I saw you last, by the altitude of a chopine.[56] You are welcome. We'll e'en to't like French falconers,[57] fly at anything we see: We'll have a speech straight: Come, give us a taste of your quality;[58] come, a passionate speech.

1st Play. (L.H.) What speech, my lord?

Ham. I heard thee speak me a speech once,--but it was never acted; or, if it was, not above once; for the play, I remember, pleased not the million; 'twas caviare to the general:[59] but it was an excellent play, well digested in the scenes, set down with as much modesty as cunning.[60] One speech in it I chiefly loved; 'twas Æneas' tale to Dido; and thereabout of it especially, where he speaks of Priam's slaughter: If it live in your memory, begin at this line; let me see, let me see;--

The rugged Pyrrhus, like the Hyrcanian beast,--'tis not so: it begins with Pyrrhus:

The rugged Pyrrhus,--he, whose sable arms, _Black as his purpose, did the night resemble_, _Old grandsire Priam seeks._

Pol. (R.) 'Fore Heaven, my lord, well spoken, with good accent and good discretion.

Ham. (C.) So proceed you.

1st Play. (L.) _Anon he finds him Striking too short at Greeks; his antique sword, Rebellious to his arm, lies where it falls, Repugnant to command: Unequal match'd, Pyrrhus at Priam drives; in rage strikes wide; But with the whiff and wind of his fell sword[61] The unnerved father falls. But, as we often see, against some storm, A silence in the heavens, the rack[62] stand still, The bold wind speechless, and the orb below As hush as death; anon the dreadful thunder Doth rend the region; So, after Pyrrhus' pause, A roused vengeance sets him new a work; And never did the Cyclops' hammers fall On Mars's armour, forg'd for proof eterne, With less remorse than Pyrrhus' bleeding sword Now falls on Priam.-- Out, out, thou fickle Fortune!_

Pol. (R.) This is too long.

Ham. It shall to the barber's, with your beard.--Say on;--come to Hecuba.

1st Play. _But who, ah woe, had seen the mobled queen_--

Ham. The mobled queen?[63]

Pol. That's good; mobled queen is good.

1st Play. _Run barefoot up and down, threatening the flames; A clout upon that head Where late the diadem stood; and, for a robe, A blanket, in the alarm of fear caught up; Who this had seen, with tongue in venom steep'd, 'Gainst fortune's state would

treason have pronounced._

Pol. Look, whether he has not turned his colour, and has tears in's eyes.--Prithee, no more.

Ham. (C.) 'Tis well; I'll have thee speak out the rest of this soon.--Good, my lord, will you see the players well bestowed? Do you hear, let them be well used; for they are the abstract and brief chronicles of the time: After your death you were better have a bad epitaph than their ill report while you live.

Pol. (R.) My lord, I will use them according to their desert.

Ham. Much better: Use every man after his desert, and who shall 'scape whipping? Use them after your own honour and dignity: The less they deserve, the more merit is in your bounty. Take them in.

[_Crosses to_ R.H.]

Pol. Come, sirs.

Ham. Follow him, friends: we'll hear a play to-morrow.

[_Exit_ POLONIUS _with some of the_ Players, L.H.]

Old friend

[_Crosses to_ C.]

--My good friends

[_To_ ROSENCRANTZ _and_ GUILDENSTERN.]

I'll leave you till night: you are welcome to Elsinore--can you play the murder of Gonzago?

[_Exeunt_ ROSENCRANTZ _and_ GUILDENSTERN, R.H.]

1st Play. Ay, my lord.

Ham. We'll have it to-morrow night. You could, for a need, study a speech of some dozen or sixteen lines, which I would insert in't--could you not?

1st Play. Ay, my lord.

Ham. Very well.--Follow that lord; and look you mock him not.

[_Exit_ Player, L.H.]

Now I am alone. O, what a rogue and peasant slave am I! Is it not monstrous, that this player here, But in a fiction, in a dream of passion, Could force his soul so to his own conceit, That, from her working, all his visage wann'd;[64] Tears in his eyes, distraction in's aspect, A broken voice, and his whole function suiting With forms to his conceit?[65] And all for nothing! For Hecuba? What's Hecuba to him, or he to Hecuba, That he should weep for her? What would he do, Had he the motive and the cue[66] for passion That I have? He would drown the stage with tears, And cleave the general ear with horrid speech; Make mad the guilty, and appal the free; Confound the ignorant, and amaze, indeed, The very faculties of eyes and ears. Yet I, A dull and muddy-mettled rascal, peak, Like John a-dreams,[67] unpregnant of my cause,[68] And can say nothing; no, not for a king, Upon whose property and most dear life A damn'd defeat was made.[69] Am I a coward? Who calls me villain? breaks my pate across? Plucks off my beard, and blows it in my face? Tweaks me by the nose? gives me the lie i'the throat, As deep as to the lungs? Who does me this, Ha? Why, I should take it: for it cannot be But I am pigeon-liver'd, and lack gall To make oppression bitter;[70] or, ere this, I should have fatted all the region kites With this slave's offal: Bloody, bawdy villain! Remorseless, treacherous, lecherous, kindless[71] villain! O, vengeance! Why, what an ass am I! This is most brave, That I, the son of a dear father murder'd, Prompted to my revenge by heaven and hell, Must, like a scold, unpack my heart with words, And fall a cursing, like a very drab, A scullion! Fye upon't! fye! About, my brains![72] I have heard That guilty creatures, sitting at a play, Have by the very cunning of the scene Been struck so to the soul, that presently They have proclaim'd their malefactions; For murder, though it have no tongue, will speak With most miraculous organ. I'll have these players Play something like the murder of my father Before mine uncle: I'll observe his looks; I'll

tent him to the quick:[73] if he do blench,[74] I know my course. The spirit that I have seen May be the devil: and the devil hath power To assume a pleasing shape; yea, and, perhaps Out of my weakness and my melancholy (As he is very potent with such spirits), Abuses me to damn me: I'll have good grounds More relative than this:[75] The play's the thing Wherein I'll catch the conscience of the king.

[_Exit_, R.H.]

END OF ACT SECOND.

Notes

Act II

[Footnote II.1: _Polonius_,] Doctor Johnson describes Polonius as "a man bred in courts, exercised in business, stored with observation, confident in his knowledge, proud of his eloquence, and declining into dotage. A man positive and confident, because he knows his mind was once strong, and knows not that it is become weak." The idea of dotage encroaching upon wisdom will solve all the phenomena of the character of Polonius.]

[Footnote II.2: _His bulk_,] Frame.]

[Footnote II.3: _Ecstacy of love_;] _i.e._, madness of love. In this sense the word is now obsolete.]

[Footnote II.4:

This must be known; which being kept close, might move More grief to hide than hate to utter love.]

_i.e._, this must be made known to the king, for (being kept secret) the hiding Hamlet's love might occasion more mischief to us from him and the queen, than the uttering or revealing of it will occasion hate and resentment from Hamlet.

It was the custom of Shakespeare's age, to conclude acts and scenes with a couplet, a custom which was continued for nearly a century afterwards.]

[Footnote II.5: _The understanding of himself_,] _i.e._, the just estimate of himself.]

[Footnote II.6: _Vouchsafe your rest_] Please to reside.]

[Footnote II.7: _Of us_,] _i.e._, over us.]

[Footnote II.8: _In the full bent_,] To the full stretch and range--a term derived from archery.]

[Footnote II.9: _The trail of policy_] The _trail_ is the _course_ of an animal pursued by the scent.]

[Footnote II.10: _Expostulate_] To _expostulate_ is to discuss, to put the pros and cons, to answer demands upon the question. _Expose_ is an old term of similar import.]

[Footnote II.11: _Perpend._] _i.e._, reflect, consider attentively.]

[Footnote II.12: _Most beautified Ophelia_,] Heywood, in his History of Edward VI., says "Katharine Parre, Queen Dowager to King Henry VIII., was a woman _beautified_ with many excellent virtues." The same expression is frequently used by other old authors.]

[Footnote II.13: _In her excellent white bosom_,] The ladies, in Shakespeare's time, wore pockets in the front of their stays.]

[Footnote II.14: _These, &c._] In our poet's time, the word _these_ was usually added at the end of the superscription of letters.]

[Footnote II.15: _I am ill at these numbers_;] No talent for these rhymes.]

[Footnote II.16: _O most best_,] An ancient mode of expression.]

[Footnote II.17: _Whilst this machine is to him_,] Belongs to, obey his impulse; so long as he is "a sensible warm motion," the similar expression to "While my wits are my own."]

[Footnote II.18: _And more above_,] _i.e._, moreover, besides.]

[Footnote II.19: _His solicitings_,] _i.e._, his love-making, his tender expressions.]

[Footnote II.20: _If I had played the desk, or table book_;] This line may either mean _if I had conveyed intelligence between them_, or, _known of their love, if I had locked up his secret in my own breast, as closely as it were confined in a desk or table book._]

[Footnote II.21: _Or given my heart a winking, mute and dumb_;] _i.e._, connived at it.]

[Footnote II.22: _With idle sight_;] _i.e._, with indifference.]

[Footnote II.23: _Round to work_,] _i.e._, roundly, without reserve.]

[Footnote II.24: _Which done, she took the fruits of my advice_;] She took the _fruits_ of advice when she obeyed advice, the advice was then made _fruitful._--JOHNSON.]

[Footnote II.25: _I'll board him presently._] Accost, address him.]

[Footnote II.26: _You are a fishmonger._] This was an expression better understood in Shakespeare's time than at present, and no doubt was relished by the audience of the Globe Theatre as applicable to the Papists, who in Queen Elizabeth's time were esteemed enemies to the Government. Hence the proverbial phrase of _He's an honest man and eats no fish_; to signify he's a friend to the Government and a Protestant.]

[Footnote II.27: _For if the sun breed maggots in a dead dog, being a god, kissing carrion,----Have you a daughter?_] _i.e._, Hamlet having just remarked that honesty is very rare in the world, adds, that since there is so little virtue, since corruption abounds everywhere, and maggots are _bred_ by the sun, which is a god, even in a dead dog, Polonius ought to take care to prevent his daughter from walking in the sun, lest she should prove _"a breeder of sinners;"_ for though _conception_ (understanding) in general be a blessing, yet as Ophelia might chance to _conceive_ (to be pregnant), it might be a calamity. Hamlet's abrupt question, _"Have you a daughter?"_ is evidently intended to impress Polonius with the belief of the Prince's madness.--MALONE.]

[Footnote II.28: _The satirical rogue_] Hamlet alludes to Juvenal, who in his 10th Satire, describes the evils of long life.]

[Footnote II.29: _How pregnant his replies_] Big with meaning.]

[Footnote II.30: _Beaten way of friendship_,] Plain track, open and unceremonious course.]

[Footnote II.31: _Rights of our fellowship and constancy of our youth_,] Habits of familiar intercourse and correspondent years.]

[Footnote II.32: _A better proposer_] An advocate of more address in shaping his aims, who could make a stronger appeal.]

[Footnote II.33: _Even_] Without inclination any way.]

[Footnote II.34: _Nay, then, I have an eye of you._] _i.e._, I have a glimpse of your meaning. Hamlet's penetration having shown him that his two friends are set over him as spies.]

[Footnote II.35: _So shall my anticipation prevent your discovery, and your secrecy to the king and queen moult no feather._] Be beforehand with your discovery, and the plume and gloss of your secret pledge be in no feather shed or tarnished.]

[Footnote II.36: _Express_] According to pattern, justly and perfectly modelled.]

[Footnote II.37: _Paragon_] Model of perfection.]

[Footnote II.38: _Lenten entertainment_] _i.e._, sparing, like the entertainments given in Lent.]

[Footnote II.39: _We coted them on the way_;] To cote, is to pass by, to pass the side of another. It appears to be a word of French origin, and was a common sporting term in Shakespeare's time.]

[Footnote II.40: _The humorous man shall end his part in peace_;] The fretful or capricious man shall vent the whole of his spleen undisturbed.]

[Footnote II.41: _The lady shall say her mind freely, or the blank verse shall halt for't._] _i.e._, the lady shall mar the measure of the verse, rather than not express herself freely and fully.]

[Footnote II.42: _Travel?_] Become strollers.]

[Footnote II.43: _It is not very strange; for my uncle is king of Denmark_;] This is a reflection on the mutability of fortune, and the variableness of man's mind.]

[Footnote II.44: _Make mouths at him_] _i.e._, deride him by antic gestures and mockery.]

[Footnote II.45: _In little._] In miniature.]

[Footnote II.46: _I know a hawk from a hern-shaw._] A hernshaw is a heron or hern. _To know a hawk from a hernshaw_ is an ancient proverb, sometimes corrupted into _handsaw_. Spencer quotes the proverb, as meaning, _wise enough to know the hawk from its game._]

[Footnote II.47: _Buz, buz!_] Sir William Blackstone states that _buz_ used to be an interjection at Oxford when any one began a story that was generally known before.]

[Footnote II.48: _Then came each actor on his ass._] This seems to be a line of a ballad.]

[Footnote II.49: _Seneca cannot be too heavy, nor Plautus too light._] An English translation of the tragedies of Seneca was published in 1581, and one comedy of Plautus, viz., the Menœchme, in 1595.]

[Footnote II.50: _For the law of writ and the liberty, these are the only men._] The probable meaning of this passage is,--_For the observance of the rules of the Drama, while they take such liberties, as are allowable, they are the only men_--_writ_ is an old word for _writing_.]

[Footnote II.51: _As by lot, God wot_,] There was an old ballad entitled the song of Jephthah, from which these lines are probably quotations. The story of Jephthah was also one of the favourite subjects of ancient tapestry.]

[Footnote II.52: _The first row of the pious Chanson_] This expression does not appear to be very well understood. Steevens tells us that the _pious chansons_ were a kind of _Christmas carols_, containing some scriptural history thrown into loose rhymes, and sung about the streets. The _first row_ appears to mean the _first division_ of one of these.]

[Footnote II.53: _My abridgment comes._] Hamlet alludes to the players, whose approach will shorten his talk.]

[Footnote II.54: _Thy face is valanced_] _i.e._, fringed with a beard. The valance is the fringes or drapery hanging round the tester of a bed.]

[Footnote II.55: _Com'st thou to beard me_] To _beard_ anciently meant to set _at defiance_. Hamlet having just told the player that his face is valanced, is playing upon the word _beard_.]

[Footnote II.56: _By the altitude of a chopine._] A chioppine is a high shoe, or rather clog, worn by the Italians. Venice was more famous for them than any other place. They are described as having been made of wood covered with coloured leather, and sometimes _even half a yard high_, their altitude being proportioned to the rank of the lady, so that they could not walk without being supported.]

[Footnote II.57: _Like French falconers_,] The French seem to have been the first and noblest falconers in the western part of Europe. The French king sent over his falconers to show that sport to King James the First.--_See Weldon's Court of King James._]

[Footnote II.58: _Quality_;] Qualifications, faculty.]

[Footnote II.59: _Caviare to the general_;] Caviare is the spawn of fish pickled, salted, and dried. It is imported from Russia, and was considered in the time of Shakespeare a new and fashionable luxury, not obtained or relished by the vulgar, and therefore used by him to signify anything above their comprehension--general is here used for the people.]

[Footnote II.60: _As much modesty as cunning._] As much propriety and decorum as skill.]

[Footnote II.61: _Falls with the whiff and wind of his fell sword_] Our author employs the same image in almost the same phrase:

"The Grecians _fall Even in the fan and wind of your fair sword._"

Tr. & Cress. V. 3. Tr.]

[Footnote II.62: _The rack_] The clouds or congregated vapour.]

[Footnote II.63: _The mobled queen?_] Mobled is veiled, muffled, disguised.]

[Footnote II.64: _All his visage wann'd_;] _i.e._, turned pale or wan.]

[Footnote II.65: _His whole functions suiting with forms to his conceit?_] _i.e._, his powers and faculties--the whole energies of his soul and body giving material forms to his passion, such as tone of voice, expression of face, requisite action, in accordance with the ideas that floated in his conceit or imagination.]

[Footnote II.66: _The cue_] The point--the direction.]

[Footnote II.67: _Like John a-dreams_,] Or dreaming John, a name apparently coined to suit a dreaming, stupid person; he seems to have been a well-known character.]

[Footnote II.68: _Unpregnant of my cause_,] _i.e._, not quickened with a new desire of vengeance; not teeming with revenge.]

[Footnote II.69: _Defeat was made._] Overthrow.]

[Footnote II.70: _Lack gall to make oppression bitter_;] _i.e._, lack gall to make me feel the bitterness of oppression.]

[Footnote II.71: _Kindless_] Unnatural.]

[Footnote II.72: _About, my brains!_] Wits to work.]

[Footnote II.73: _I'll tent him to the quick:_] _i.e._, probe him--search his wounds.]

[Footnote II.74: _Blench_,] Shrink, start aside.]

[Footnote II.75: _More relative than this:_] Directly applicable.]

ACT III.

SCENE I.--A ROOM IN THE CASTLE.

Three chairs on L.H., _one on_ R.

Enter KING _and_ QUEEN, _preceded by_ POLONIUS. OPHELIA, ROSENCRANTZ, _and_ GIULDENSTERN, _following_ (R.H.)

King. (C.) And can you, by no drift of conference, Get from him why he puts on this confusion?

Ros. (R.) He does confess he feels himself distracted; But from what cause he will by no means speak.

Guild. (R.) Nor do we find him forward[1] to be sounded But, with a crafty madness, keeps aloof, When we would bring him on to some confession Of his true state.

Queen. (R.C.) Did you assay him[2] To any pastime?

Ros. Madam, it so fell out, that certain players We o'er-raught on the way:[3] of these we told him; And there did seem in him a kind of joy To hear of it: They are about the court; And, as I think, they have already order This night to play before him.

Pol. 'Tis most true: And he beseech'd me to entreat your majesties To hear and see the matter.

King. With all my heart; and it doth much content me To hear him so inclin'd. Good gentlemen, give him a further edge, And drive his purpose on to these delights.

Ros. We shall, my lord.

[_Exeunt_ ROSENCRANTZ _and_ GUILDENSTERN, R.H.]

King. Sweet Gertrude, leave us too; For we have closely sent[4] for Hamlet hither, That he, as 'twere by accident, may here Affront Ophelia:[5] Her father and myself (lawful espials[6]), Will so bestow ourselves, that, seeing, unseen, We may of their encounter frankly judge; And gather by him, as he is behaved, If't be the affliction of his love or no That thus he suffers for.

Queen. (R.) I shall obey you: And for your part, Ophelia,

[OPHELIA _comes down_ L.H.]

I do wish That your good beauties be the happy cause Of Hamlet's wildness: so shall I hope your virtues Will bring him to his wonted way again, To both your honours.

Oph. Madam, I wish it may.

[_Exit_ QUEEN, R.H.]

Pol. Ophelia, walk you here. Gracious, so please you, We will bestow ourselves. Read on this book;

[_To_ OPHELIA.]

That show of such an exercise may colour Your loneliness. We are oft to blame in this,-- 'Tis too much prov'd,[7] that, with devotion's visage And pious action, we do sugar o'er The devil himself.

King. O, 'tis too true! how smart A lash that speech doth give my conscience!

[_Aside._]

Pol. I hear him coming: let's withdraw, my lord.

[_Exeunt_ KING _and_ POLONIUS, R.H.2 E., _and_ OPHELIA, R.H.U.E.]

Enter HAMLET (L.H.)

Ham. To be, or not to be, that is the question:[8] Whether 'tis nobler in the mind to suffer The slings and arrows of outrageous fortune, Or to take arms against a sea of troubles,[9] And, by opposing end them?--To die,--to sleep, No more;--and by a sleep, to say we end The heart-ache, and the thousand natural shocks That flesh is heir to: 'tis a consummation Devoutly to be wished. To die,--to sleep,-- To sleep! perchance to dream: ay, there's the rub; For in that sleep of death what dreams may come, When we have shuffled off this mortal coil,[10] Must give us pause:[11] There's the respect[12] That makes calamity of so long life; For who would bear the whips and scorns of time,[13] The oppressor's wrong, the proud man's contumely,[14] The pangs of despised love, the law's delay, The insolence of office, and the spurns That patient merit of the unworthy takes, When he himself might his quietus make[15] With a bare bodkin?[16] Who would fardels bear,[17] To groan and sweat under a weary life, But that the dread of something after death, The undiscovered country, from whose bourn[18] No traveller returns,[19] puzzles the will, And makes us rather bear those ills we have Than fly to others that we know not of? Thus, conscience does make cowards of us all;[20] And thus the native hue of resolution Is sicklied o'er with the pale cast of thought; And enterprises of great pith and moment,[21] With this regard, their currents turn away, And lose the name of action.[22]--

[OPHELIA _returns._]

--Soft you now![23] The fair Ophelia:--Nymph, in thy orisons[24] Be all my sins remember'd.

Oph. (R.C.) Good my lord, How does your honour for this many a day?

Ham. (L.C.) I humbly thank you; well.

Oph. My lord, I have remembrances of yours, That I have longèd long to re-deliver; I pray you, now receive them.

Ham. No, not I; I never gave you aught.

Oph. My honour'd lord, you know right well you did; And, with them, words of so sweet breath compos'd As made the things more rich: their perfume lost, Take these again; for to the noble mind Rich gifts wax poor when givers prove unkind. There, my lord.

Ham. Ha, ha! are you honest?

Oph. My lord?

Ham. Are you fair?

Oph. What means your lordship?

Ham. That if you be honest and fair, your honesty should admit no discourse to your beauty.[25]

Oph. Could beauty, my lord, have better commerce than with honesty?

Ham. Ay, truly; for the power of beauty will sooner transform honesty from what it is to a bawd, than the force of honesty can translate beauty into his likeness:[26] this was some time a paradox, but now the time gives it proof. I did love you once.

Oph. Indeed, my lord, you made me believe so.

Ham. You should not have believed me; for virtue cannot so inoculate our old stock, but we shall relish of it:[27] I loved you not.

Oph. I was the more deceived.

Ham. Get thee to a nunnery: Why wouldst thou be a breeder of sinners? I am myself indifferent honest; but yet I could accuse me of such things, that it were better my mother had not borne me: I am very proud, revengeful, ambitious; with more offences at my beck[28] than I have thoughts to put them in,[29] imagination to give them shape, or time to act them in. What should such fellows as I do, crawling between earth and heaven? We are arrant knaves, all; believe none of us. Go thy ways to a nunnery. Where's your father?

Oph. At home, my lord.

Ham. Let the doors be shut upon him, that he may play the fool nowhere but in's own house. Farewell.

Oph. O, help him, you sweet heavens!

Ham. If thou dost marry, I'll give thee this plague for thy dowry. Be thou as chaste as ice, as pure as snow, thou shalt not escape calumny. Get thee to a nunnery; farewell. Or, if thou wilt needs marry, marry a fool; for wise men know well enough what monsters you make of them. To a nunnery, go; go; go.

Oph. Heavenly powers, restore him!

Ham. I have heard of your paintings[30] too, well enough; Heaven hath given you one face, and you make yourselves another:[31] you jig, you amble, and you lisp,[32] and nickname Heaven's creatures, and make your wantonness your ignorance.[33] Go to, I'll no more of't; it hath made me mad.

[HAMLET _crosses to_ R.H.]

I say, we will have no more marriages: those that are married already, all but one,[34] shall live; the rest shall keep as they are. To a nunnery, go.

[_Exit_ HAMLET, R.H.[35]]

Oph. (L.) O, what a noble mind is here o'erthrown! The expectancy and rose of the fair state,[36] The glass of fashion[37] and the mould of form,[38] The observ'd of all observers, quite, quite down! And I, of ladies most deject and wretched, That suck'd the honey of his musick vows,[39] Now see that noble and most sovereign reason, Like sweet bells jangled, out of tune and harsh: O, woe is me, To have seen what I have seen, see what I see!

[_Exit_ OPHELIA, L.H.]

Re-enter KING _and_ POLONIUS.

King. Love! his affections do not that way tend; Nor what he spake, though it lack'd form a little, Was not like madness. There's something in his soul, O'er which his melancholy sits on brood; He shall with speed to England, For the demand of our neglected tribute: Haply, the seas, and countries different, With variable objects, shall expel This something-settled matter in his heart; Whereon his brains still beating puts him thus From fashion of himself. What think you on't?

Pol. It shall do well: But yet I do believe The origin and commencement of his grief Sprung from neglected love. My lord, do as you please; But, if you hold it fit, after the play, Let his queen mother all alone entreat him To show his grief: let her be round with him;[40] And I'll be placed, so please you, in the ear Of all their conference. If she find him not,[41] To England send him; or confine

him where Your wisdom best shall think.

King. It shall be so: Madness in great ones must not unwatch'd go.

[_Exeunt_, L.H.]

Enter HAMLET _and a_ Player (R.H.)

Ham. (C.) Speak the speech, I pray you, as I pronounced it to you, trippingly on the tongue: but if you mouth it, as many of our players do, I had as lief[42] the town-crier spoke my lines. Nor do not saw the air too much with your hands thus;[43] but use all gently: for in the very torrent, tempest, and (as I may say) whirlwind of your passion, you must acquire and beget a temperance that may give it smoothness. O, it offends me to the soul, to hear a robustious perrywig-pated fellow[44] tear a passion to tatters, to very rags, to split the ears of the groundlings,[45] who, for the most part, are capable of nothing but inexplicable dumb shows and noise: I would have such a fellow whipped for o'erdoing Termagant;[46] it out-herods Herod:[47] Pray you, avoid it.

1st Play. (R.) I warrant your honour.

Ham. Be not too tame neither, but let your own discretion be your tutor; suit the action to the word, the word to the action; with this special observance, that you o'erstep not the modesty of nature: for any thing so overdone is from the purpose of playing, whose end, both at the first and now, was and is, to hold, as 'twere, the mirror up to nature; to show virtue her own feature, scorn her own image, and the very age and body of the time its form and pressure.[48] Now, this overdone, or come tardy off,[49] though it make the unskilful laugh, cannot but make the judicious grieve; the censure of which one[50] must, in your allowance,[51] o'erweigh a whole theatre of others. O, there be players that I have seen play, and heard others praise, and that highly, not to speak it profanely,[52] that, neither having the accent of christians, nor the gait of christian, pagan, nor man, have so strutted and bellowed, that I have thought some of nature's journeymen had made men, and not made them well, they imitated humanity so abominably.

[_Crosses to_ R.]

1st Play. (L.) I hope we have reformed that indifferently[53] with us.

Ham. O, reform it altogether. And let those that play your clowns speak no more than is set down for them:[54] for there be of them that will themselves laugh, to set on some quantity of barren spectators[55] to laugh too; though, in the mean time, some necessary question[56] of the play be then to be considered: that's villainous, and shows a most pitiful ambition in the fool that uses it. Go, make you ready.

[_Exit_ Player, L.H.]

Ham. What, ho, Horatio!

Enter HORATIO (R.H.)

Hor. Here, sweet lord, at your service.

Ham. Horatio, thou art e'en as just a man As e'er my conversation cop'd withal.[57]

Hor. O, my dear lord.

Ham. Nay, do not think I flatter; For what advancement may I hope from thee, That no revenue hast, but thy good spirits, To feed and clothe thee? Why should the poor be flatter'd? No, let the candied tongue lick absurd pomp; And crook the pregnant hinges of the knee,[58] Where thrift may follow fawning. Dost thou hear? Since my dear soul[59] was mistress of her choice, And could of men distinguish, her election Hath seal'd thee for herself: for thou hast been As one, in suffering all, that suffers nothing; A man that fortune's buffets and rewards Has ta'en with equal thanks: and bless'd are those Whose blood and judgment[60] are so well co-mingled, That they are not a pipe for fortune's finger To sound what stop she please. Give me that man That is not passion's slave, and I will wear him In my heart's core, ay, in my heart of heart, As I do thee.--Something too much of this.-- There is a play to-night before the king; One scene of it comes near the circumstance Which I have told thee of my father's death: I pr'ythee when thou seest that act a-foot, Even with the very comment of thy soul[61] Observe my uncle: if his occulted guilt[62] Do not itself unkennel in one speech, It is a damned ghost that we have seen; And my imaginations are as foul As Vulcan's stithy.[63] Give him heedful note: For I mine eyes will rivet to his face; And, after, we will both our judgments join In censure of his seeming.[64]

[HORATIO _goes off_, U.E.L.H.]

March. Enter KING _and_ QUEEN, _preceded by_ POLONIUS, OPHELIA, HORATIO, ROSENCRANTZ, GUILDENSTERN, Lords, Ladies, _and_ Attendants. KING _and_ QUEEN _sit_ (L.H.); OPHELIA (R.H.)

King. (L.) How fares our cousin Hamlet?

Ham. (C.) Excellent, i'faith; of the cameleon's dish: I eat the air, promise-crammed: you cannot feed capons so.

King. I have nothing with this answer, Hamlet; these words are not mine.[65]

Ham. No, nor mine, now.[66] My lord,--you played once in the university, you say?[67]

[_To_ POLONIUS, L.]

Pol. (L.C.) That did I, my lord; and was accounted a good actor.

Ham. (C.) And what did you enact?

Pol. I did enact Julius Cæsar:[68] I was killed i'the Capitol; Brutus killed me.

Ham. It was a brute part of him to kill so capital a calf there.--Be the players ready?

Ros. Ay, my lord; they stay upon your patience.[69]

Queen. Come hither, my dear Hamlet, sit by me.

[_Pointing to a chair by her side._]

Ham. No, good mother, here's metal more attractive.

Pol. O, ho! do you mark that?

[_Aside to the_ KING.]

Ham. Lady, shall I lie in your lap?

[_Lying down at_ OPHELIA'S _feet._][70]

Oph. (R.) You are merry, my lord.

Ham. O, your only jig-maker.[71] What should a man do but be merry? for, look you, how cheerfully my mother looks, and my father died within these two hours.

Oph. Nay, 'tis twice two months, my lord.

Ham. So long? Nay, then, let the devil wear black, for I'll have a suit of sables.[72] O heavens! die two months ago, and not forgotten yet? Then there's hope a great man's memory may outlive his life half a year: But, by'r-lady, he must build churches, then.[73]

Oph. What means the play, my lord?

Ham. Miching mallecho;[74] it means mischief.

Oph. But what is the argument of the play?

Enter a Player _as_ Prologue (L.H.) _on a raised stage._

Ham. We shall know by this fellow.

Pro. _For us, and for our tragedy, Here stooping to your clemency, We beg your hearing patiently._

[_Exit_, L.H.]

Ham. Is this a prologue, or the posy of a ring?[75]

Oph. 'Tis brief, my lord.

Ham. As woman's love.

Enter a KING _and a_ QUEEN (L.H.) _on raised stage._

P. King. (R.) Full thirty times hath Phoebus' cart[76] gone round Neptune's salt wash and Tellus' orbèd ground,[77] Since love our hearts, and Hymen did our hands, Unite commutual in most sacred bands.

P. Queen. (L.) So many journeys may the sun and moon Make us again count o'er ere love be done! But, woe is me, you are so sick of late, So far from cheer and from your former state, That I distrust you. Yet, though I distrust, Discomfort you, my lord, it nothing must.

P. King. 'Faith, I must leave thee, love, and shortly too; My operant powers their functions leave to do:[78] And thou shalt live in this fair world behind, Honour'd, belov'd; and, haply one as kind For husband shalt thou----

P. Queen. O, confound the rest! Such love must needs be treason in my breast: In second husband let me be accurst! None wed the second but who kill'd the first.

Ham. That's wormwood.

[_Aside to_ HORATIO, R.]

P. King. I do believe you think what now you speak; But what we do determine oft we break.[79] So think you thou wilt no second husband wed; But die thy thoughts when thy first lord is dead.

P. Queen. Nor earth to me give food, nor heaven light! Sport and repose lock from me day and night! Both here, and hence, pursue me lasting strife, If, once a widow, ever I be wife!

P. King. 'Tis deeply sworn.

Ham. If she should break it now!--

[_To_ OPHELIA.]

P. King. Sweet, leave me here awhile; My spirits grow dull, and fain I would beguile The tedious day with sleep.

[_Reposes on a bank_, R., _and sleeps._]

P. Queen. Sleep rock thy brain; And never come mischance between us twain!

[_Exit_, L.H.]

Ham. Madam, how like you this play?

Queen. The lady doth protest too much, methinks.

Ham. O, but she'll keep her word.

King. Have you heard the argument?[80] Is there no offence in't?

Ham. No, no, they do but jest, poison in jest; no offence i'the world.

King. What do you call the play?

Ham. The mouse-trap.[81] Marry, how? Tropically.[82] This play is the image of a murder[83] done in Vienna: Gonzago is the Duke's name; his wife, Baptista: you shall see anon;--'tis a knavish piece of work: but what of that? your majesty, and we that have free souls, it touches us not: Let the galled jade wince,[84] our withers[85] are unwrung.

Enter LUCIANUS (L.H.)

This is one Lucianus, nephew to the king.

Oph. You are as good as a chorus,[86] my lord.

Ham. I could interpret between you and your love, if I could see the puppets dallying.[87] Begin, murderer; leave thy damnable faces, and begin. Come:--

----The croaking raven Doth bellow for revenge.[88]

Luc. Thoughts black, hands apt, drugs fit, and time agreeing; Confederate season, else no creature seeing; Thou mixture rank, of midnight weeds[89] collected, With Hecat's ban thrice blasted, thrice infected, Thy natural magick and dire property, On wholesome life usurp[90] immediately. [_Pours the poison into the Sleeper's Ears._]

Ham. He poisons him i' the garden for his estate. His name's Gonzago: the story is extant, and written in very choice Italian: You shall see anon how the murderer gets the love of Gonzago's wife.

King. Give me some light: away!

All. Lights, lights, lights!

[_Exeunt all_, R. _and_ L., _but_ HAMLET _and_ HORATIO.]

Ham. Why, let the strucken deer go weep,[91] The hart ungallèd play; For some must watch, while some must sleep: So runs the world away.--

O, good Horatio, I'll take the ghost's word for a thousand pounds. Didst perceive?

Hor. (R.) Very well, my lord.

Ham. (C.) Upon the talk of the poisoning.--

Hor. I did very well note him.

Ham. Ah, ah! come, some musick! come, the recorders!

[_Exit_ HORATIO, R.H.]

Enter ROSENCRANTZ _and_ GUILDENSTERN (L.H.) HAMLET _seats himself in the chair_ (R.)

Guil. (L.C.) Good my lord, vouchsafe me a word with you.

Ham. Sir, a whole history.

Guil. The king, sir,----

Ham. Ay, sir, what of him?

Guil. Is, in his retirement, marvellous distempered.[92]

Ham. With drink, sir?

Guil. No, my lord, with choler.

Ham. Your wisdom should show itself more rich to signify this to the doctor; for, for me to put him to his purgation would perhaps plunge him into more choler.

Guil. Good my lord, put your discourse into some frame, and start not so wildly from my affair.

Ham. I am tame, sir:--pronounce.

Guil. The queen, your mother, in most great affliction of spirit, hath sent me to you.

Ham. You are welcome.

Guil. Nay, good my lord, this courtesy is not of the right breed. If it shall please you to make me a wholesome answer, I will do your mother's commandment: if not, your pardon and my return shall be the end of my business.

Ham. Sir, I cannot.

Guil. What, my lord?

Ham. Make you a wholesome answer; my wit's diseased! But, sir, such answer as I can make, you shall command: or rather as you say, my mother: therefore no more, but to the matter: My mother, you say,--

Ros. (_Crosses to_ C.) Then thus she says: Your behaviour hath struck her into amazement and admiration.[93]

Ham. O wonderful son, that can so astonish a mother! But is there no sequel at the heels of this mother's admiration?--impart.

Ros. She desires to speak with you in her closet, ere you go to bed.

Ham. We shall obey, were she ten times our mother. Have you any further trade with us?[94]

Ros. My lord, you once did love me.

Ham. And do still, by these pickers and stealers.[95]

[_Rises and comes forward_, C.]

Ros. (R.) Good my lord, what is your cause of distemper? you do, surely, bar the door of your own liberty, if you deny your griefs to your friend.[96]

Ham. Sir, I lack advancement.

Ros. How can that be, when you have the voice of the king himself for your succession in Denmark?[97]

Ham. Ay, sir, but _While the grass grows_,--the proverb is something musty.[98]

Enter HORATIO _and_ Musicians (R.H.)

O, the recorders:[99]--let me see one.--So; withdraw with you:--

[_Exeunt_ HORATIO _and_ Musicians R.H. GUILDENSTERN, _after speaking privately to_ ROSENCRANTZ, _crosses behind_ HAMLET _to_ R.H.]

Why do you go about to recover the wind of me,[100] as if you would drive me into a toil?[101]

Guil. (R.) O, my lord, if my duty be too bold, my love is too unmannerly.[102]

Ham. (C.) I do not well understand that. Will you play upon this pipe?

Guil. My lord, I cannot.

Ham. I pray you.

Guil. Believe me, I cannot.

Ham. I do beseech you.

Ros. (L.) I know no touch of it, my lord.

Ham. 'Tis as easy as lying: govern these ventages with your fingers and thumb, give it breath with your mouth, and it will discourse most eloquent music.[103] Look you, these are the stops.

Guil. But these cannot I command to any utterance of harmony; I have not the skill.

Ham. Why, look you now, how unworthy a thing you make of me! You would play upon me; you would seem to know my stops; you would pluck out the heart of my mystery; you would sound me from my lowest note to the top of my compass: and there is much music, excellent voice, in this little organ; yet cannot you make it speak. 'Sdeath, do you think I am easier to be played on than a pipe? Call me what instrument you will, though you can fret me, you cannot play upon me.[104]

[_Crosses to_ L.H.]

Enter POLONIUS (R.H.)

Pol. (R.) My lord, the queen would speak with you, and presently.

Ham. (C.) Do you see yonder cloud that's almost in shape of a camel?

Pol. By the mass, and 'tis like a camel, indeed.

Ham. Methinks it is like a weasel.

Pol. It is backed like a weasel.

Ham. Or like a whale?

Pol. Very like a whale.

Ham. Then will I come to my mother by and by. They fool me to the top of my bent.[105] I will come by and by.

Pol. I will say so.

Ham. By and by is easily said.

[_Exit_ POLONIUS, R.H.

Leave me, friends.

[_Exeunt_ ROSENCRANTZ _and_ GUILDENSTERN, R.H.]

'Tis now the very witching time of night, When churchyards yawn, and hell itself breathes out Contagion to this world: Now could I drink hot blood, And do such bitter business[106] as the day Would quake to look on. Soft! now to my mother. O, heart, lose not thy nature; let not ever The soul of Nero enter this firm bosom: Let me be cruel, not unnatural; I will speak daggers to her, but use none.

[_Exit._]

SCENE II.--A ROOM IN THE SAME.

Enter KING, ROSENCRANTZ _and_ GUILDENSTERN (R.H.)

King. I like him not; nor stands it safe with us[107] To let his madness range. Therefore prepare you; I your commission will forthwith despatch, And he to England shall along with you: Arm you, I pray you, to this speedy voyage; For we will fetters put upon this fear,[108] Which now goes too free-booted.

Ros. } } We will haste us. _Guil._}

[_Cross behind the_ KING, _and exeunt_ ROSENCRANTZ _and_ GUILDENSTERN, L.H.]

Enter POLONIUS (R.H.)

Pol. My lord, he's going to his mother's closet: Behind the arras I'll convey myself,[109] To hear the process;[110] I'll warrant, she'll tax him home: And, as you said, and wisely was it said, 'Tis meet that some more audience than a mother, Since nature makes them partial, should o'erhear The speech of vantage.[111] Fare you well, my liege:

[POLONIUS _crosses to_ L.H.]

I'll call upon you ere you go to bed, And tell you what I know.

King. Thanks, dear my lord.

[_Exeunt_ POLONIUS, L.H., _and_ KING, R.H.]

SCENE III.--THE QUEEN'S CHAMBER.

Enter QUEEN _and_ POLONIUS (L.H.)

Pol. He will come straight. Look, you lay home to him:[112] Tell him his pranks have been too broad[113] to bear with, And that your grace hath screen'd and stood between Much heat and him. I'll sconce me even here.[114] Pray you, be round with him.

Queen. I'll warrant you; Fear me not:--withdraw, I hear him coming.

[POLONIUS _hides himself_, L.H.U.E.

Enter HAMLET (R.)

Ham. (R.C.) Now, mother, what's the matter?

Queen. (L.C.) Hamlet, thou hast thy father much offended.

Ham. Mother, you have my father much offended.

Queen. Come, come, you answer with an idle tongue.

Ham. Go, go, you question with a wicked tongue.

Queen. Why, how now, Hamlet!

Ham. What's the matter now?

Queen. Have you forgot me?

Ham. No, by the rood,[115] not so: You are the queen, your husband's brother's wife; And--would it were not so!--you are my mother.

Queen. Nay, then, I'll set those to you that can speak.

Ham. Come, come, and sit you down; you shall not budge; You go not till I set you up a glass Where you may see the inmost part of you.

Queen. What wilt thou do? thou wilt not murder me? Help, help, ho!

Pol.

(_Behind._)

What, ho! help!

Ham. How now! a rat?[116]

[_Draws._]

Dead, for a ducat, dead!

[HAMLET _rushes off behind the arras._]

Pol. (_Behind._) O, I am slain!

[_Falls and dies._]

Queen. O me, what hast thou done?

Ham.

(_Returning._)

Nay, I know not: Is it the king?

Queen. O, what a rash and bloody deed is this!

Ham. A bloody deed!--almost as bad, good mother, As kill a king, and marry with his brother.

Queen. As kill a king!

Ham. Ay, lady, 'twas my word.

[_Goes off behind the arras, and returns._]

Thou wretched, rash, intruding fool, farewell!

[_To the dead body of_ POLONIUS, _behind the arras_.]

I took thee for thy better. Leave wringing of your hands: Peace; sit you down,

[_To the_ QUEEN.]

And let me wring your heart: for so I shall, If it be made of penetrable stuff; If damnèd custom have not brazed it so,[117] That it be proof and bulwark against sense.[118]

Queen.

(_Sits_ R.C.)

What have I done, that thou dar'st wag thy tongue In noise so rude against me?

Ham.

(_Seated_ L.C.)

Such an act, That blurs the grace and blush of modesty; Calls virtue, hypocrite; takes off the rose From the fair forehead of an innocent love, And sets a blister there;[119] makes marriage vows As false as dicer's oaths: O, such a deed As from the body of contraction plucks The very soul;[120] and sweet religion makes A rhapsody of words.-- Ah, me, that act!

Queen. Ah me, what act?

Ham. Look here, upon this picture, and on this, The counterfeit presentment[121] of two brothers. See, what a grace was seated on this brow; Hypérion's curls;[122] the front of Jove himself; An eye like Mars, to threaten and command; A station like the herald Mercury[123] New-lighted on a heaven-kissing hill; A combination, and a form, indeed, Where every god did seem to set his seal, To give the world assurance of a man; This was your husband.--Look you now, what follows: Here is your husband; like a mildew'd ear, Blasting his wholesome brother.[124] Have you eyes? Could you on this fair mountain leave to feed, And batten on this moor?[125] Ha! have you eyes? You cannot call it love; for, at your age The hey-day in the blood[126] is tame, it's humble, And waits upon the judgment: And what judgment Would step from this to this? O shame! where is thy blush? Rebellious hell, If thou canst mutine,[127] in a matron's bones, To flaming youth let virtue be as wax, And melt in her own fire.

Queen. O, Hamlet, speak no more: Thou turn'st mine eyes into my very soul; And there I see such black and grainèd spots As will not leave their tinct.[128]

Ham. Nay, but to live In the rank sweat of an enseamed bed,----[129]

Queen. O, speak to me no more; No more, sweet Hamlet!

Ham. A murderer and a villain: A slave that is not twentieth part the tythe Of your precedent lord;--a vice of kings;[130] A cutpurse of the empire and the rule; That from a shelf the precious diadem stole, And put it in his pocket![131]

Queen. No more!

Ham. A king Of shreds and patches.[132]

[_Enter_ Ghost, R.]

Save me

[_Starts from his chair_],

and hover o'er me with your wings, You heavenly guards! What would your gracious figure?

Queen. Alas, he's mad!

[_Rising._]

Ham. (L.) Do you not come your tardy son to chide, That, laps'd in time and passion,[133] lets go by The important acting of your dread command? O, say!

Ghost. (R.) Do not forget: This visitation Is but to whet thy almost blunted purpose. But, look, amazement on thy mother sits: O, step between her and her fighting soul. Speak to her Hamlet.

Ham. How is it with you, lady?

Queen. Alas, how is't with you, That you do bend your eye on vacancy, And with the incorporal air do hold discourse? Forth at your eyes your spirits wildly peep. O gentle son,

[_Crosses to_ HAMLET.]

Upon the heat and flame of thy distemper Sprinkle cool patience.[134] Whereon do you look?

Ham. On him, on him!--Look you, how pale he glares! His form and cause conjoin'd, preaching to stones, Would make them capable.[135] Do not look upon me; Lest with this piteous action, you convert My stern effects:[136] then what I have to do Will want true colour; tears perchance, for blood.

Queen. To whom do you speak this?

Ham. Do you see nothing there?

Queen. Nothing at all; yet all that is, I see.[137]

Ham. Nor did you nothing hear?

Queen. No, nothing but ourselves.

Ham. Why, look you there! look, how it steals away!

[_Ghost crosses to_ L.]

My father in his habit as he lived![138] Look, where he goes, even now, out at the portal!

[_Exit_ Ghost, L.H. HAMLET _sinks into chair_ C. _The_ QUEEN _falls on her knees by his side._]

Queen. This is the very coinage of your brain: This bodiless creation ecstasy Is very cunning in.[139]

Ham. Ecstasy! My pulse, as yours, doth temperately keep time, And makes as healthful music: It is not madness That I have uttered: bring me to the test, And I the matter will re-word; which madness Would gambol from.[140] Mother, for love of grace,

Rising.]

Lay not that flattering unction to your soul, That not your trespass, but my madness speaks: It will but skin and film[141] the ulcerous place, Whiles rank corruption, mining all within, Infects unseen. Confess yourself to heaven; Repent what's past; avoid what is to come.

Queen. O, Hamlet! thou hast cleft my heart in twain.

Ham. O, throw away the worser part of it, And live the purer with the other half. Good night: but go not to my uncle's bed;

[_Raising the_ QUEEN.]

Assume a virtue, if you have it not. Once more, good night! And when you are desirous to be bless'd, I'll blessing beg of you.[142] For this same lord,

[_Pointing to_ POLONIUS.]

I do repent: I will bestow him, and will answer well The death I gave him. So, again, good night.

[_Exit_ QUEEN, R.H.]

I must be cruel, only to be kind: Thus bad begins, and worse remains behind.

[_Exit_ HAMLET _behind the arras_, L.H.U.E.

END OF ACT THIRD.

Notes

Act III

[Footnote III.1: _Forward_] Disposed, inclinable.]

[Footnote III.2: _Assay him to_] Try his disposition towards.]

[Footnote III.3: _O'er-raught on the way:_] Reached or overtook.]

[Footnote III.4 _Have closely sent_] _i.e._, privately sent.]

[Footnote III.5 _May here affront Ophelia:_] To affront is to come face to face--to confront.]

[Footnote III.6 _Lawful espials_,] Spies justifiably inquisitive. From the French, _espier_.]

[Footnote III.7 _Too much prov'd_,] Found by too frequent experience.]

[Footnote III.8 _To be, or not to be, that is the question:_] Hamlet is deliberating whether he should continue to live, or put an end to his existence.]

[Footnote III.9: _Or to take arms against a sea of troubles_,] _A sea of troubles_ among the Greeks grew into a proverbial usage; so that the expression figuratively means, the troubles of human life, which flow in upon us, and encompass us round like a sea.]

[Footnote III.10: _This mortal coil_,] Coil is here used in each of its senses, that of turmoil or bustle, and that which entwines or wraps round.]

[Footnote III.11: _Must give us pause:_] _i.e._, occasion for reflection.]

[Footnote III.12: _There's the respect That makes calamity of so long life_;] The _consideration_ that makes the evils of life so long submitted to, lived under.]

[Footnote III.13: _The whips and scorns of time_,] Those sufferings of body and mind, those stripes and mortifications to which, in its _course_, the life of man is subjected.]

[Footnote III.14: _Contumely_,] Contemptuousness, rudeness.]

[Footnote III.15: _His quietus make_] Quietus means the official discharge of an account: from the Latin. Particularly in the Exchequer accounts, where it is still current. Chiefly used by authors in metaphorical senses.]

[Footnote III.16: _A bare bodkin?_] Bodkin was an ancient term for a small dagger. In the margin of Stowe's Chronicle it is said that Cæsar was slain with _bodkins_.]

[Footnote III.17: _Who would fardels bear_,] Fardel is a burden. Fardellus, low Latin.]

[Footnote III.18: _From whose bourn_] _i.e._, boundary.]

[Footnote III.19: _No traveller returns_,] The traveller whom Hamlet had seen, though he appeared in the same habit which he had worn in his life-time, was nothing but a shadow, "invulnerable as the air," and, consequently, _incorporeal_. The Ghost has given us no account of the region from whence he came, being, as he himself informed us, "forbid to tell the secrets of his prison-house."--MALONE.]

[Footnote III.20: _Thus conscience does make cowards of us all_;] A state of doubt and uncertainty, a conscious feeling or apprehension, a misgiving "How our audit stands."]

[Footnote III.21: _Of great pith and moment_,] _i.e._, of great vigour and importance.]

[Footnote III.22:

With this regard, their currents turn away, _And lose the name of action._]

From this sole consideration have their drifts diverted, and lose the character and name of enterprise.]

[Footnote III.23: _Soft you now!_] A gentler pace! have done with lofty march!]

[Footnote III.24: _Nymph, in thy orisons_] _i.e._, in thy prayers. Orison is from _oraison_--French.]

[Footnote III.25: _If you be honest and fair, your honesty should admit no discourse to your beauty._] _i.e._, if you really possess these qualities, chastity and beauty, and mean to support the character of both, your honesty should be so chary of your beauty, as not to suffer a thing so fragile to entertain discourse, or to be parleyed with.

The lady interprets the words otherwise, giving them the turn best suited to her purpose.]

[Footnote III.26: _His likeness:_] Shakespeare and his contemporaries frequently use the personal for the neutral pronoun.]

[Footnote III.27: _Inoculate our old stock, but we shall relish of it:_] So change the original constitution and properties, as that no smack of them shall remain. "Inoculate our stock" are terms in gardening.]

[Footnote III.28: _With more offences at my beck_] That is, always ready to come about me--at my beck and call.]

[Footnote III.29: _Than I have thoughts to put them in, &c._] "To put a thing into thought," Johnson says, is "to think on it."]

[Footnote III.30: _I have heard of your paintings_,] These destructive aids of beauty seem, in the time of Shakespeare, to have been general objects of satire.]

[Footnote III.31: _Heaven hath given you one face, and you make yourselves another:_] _i.e._, Heaven hath given you one face, and you disfigure his image by making yourself another.]

[Footnote III.32: _You jig, you amble, and you lisp_,] This is an allusion to the manners of the age, which Shakespeare, in the spirit of his contemporaries, means here to satirise.]

[Footnote III.33: _Make your wantonness your ignorance._] You mistake by _wanton_ affectation, and pretend to mistake by _ignorance_.]

[Footnote III.34: _All but one shall live_;] _One_ is the king.]

[Footnote III.35: _To a nunnery, go. Exit Hamlet._] There is no doubt that Hamlet's attachment to Ophelia is ardent and sincere, but he treats her with apparent severity because he is aware that Ophelia has been purposely thrown in his way; that spies are about them; and that it is necessary for the preservation of his life, to assume a conduct which he thought would be attributed to madness only.]

[Footnote III.36: _The expectancy and rose of the fair state_,] The first hope and fairest flower. "The gracious mark o' the land."]

[Footnote III.37: _Glass of fashion_] Speculum consuetudinis.--CICERO.

[Footnote III.38: _The mould of form_,] The cast, in which is shaped the only perfect form.

[Footnote III.39: _Musick vows_,] Musical, mellifluous.

[Footnote III.40: _Be round with him_;] _i.e._, plain with him--without reserve.

[Footnote III.41: _If she find him not_,] Make him not out.

[Footnote III.42: _As lief_] As willingly.]

[Footnote III.43: _Thus_;] _i.e._, thrown out thus.]

[Footnote III.44: _Robustious perrywig-pated fellow_] This is a ridicule on the quantity of false hair worn in Shakespeare's time, for wigs were not in common use till the reign of Charles the Second. _Robustious_ means making an extravagant show of passion.]

[Footnote III.45: _The ears of the groundlings_,] The meaner people appear to have occupied the pit of the theatre (which had neither floor nor benches in Shakespeare's time), as they now sit in the upper gallery.]

[Footnote III.46: _O'er-doing Termagant_;] The Crusaders, and those who celebrated them, confounded Mahometans with Pagans, and supposed Mahomet, or Mahound, to be one of their deities, and Tervagant or Termagant, another. This imaginary personage was introduced into our old plays and moralities, and represented as of a most violent character, so that a ranting actor might always appear to advantage in it. The word is now used for a scolding woman.]

[Footnote III.47: _It out-herods Herod:_] In all the old moralities and mysteries this personage was always represented as a tyrant of a very violent temper, using the most exaggerated language. Hence the expression.]

[Footnote III.48: _The very age and body of the time its form and pressure._] _i.e._, to delineate exactly the manners of the age, and the particular humours of the day--_pressure_ signifying resemblance, as in a print.]

[Footnote III.49: _Come tardy off_,] Without spirit or animation; heavily, sleepily done.]

[Footnote III.50: _The censure of which one_] _i.e._, the censure of one of which.]

[Footnote III.51: _Your allowance_,] In your approbation.]

[Footnote III.52: _Not to speak it profanely_,] _i.e._, _irreverently_, in allusion to Hamlet's supposition that God had not made such men, but that they were only the handy work of God's assistants.]

[Footnote III.53: _Indifferently_] In a reasonable degree.]

[Footnote III.54: _Speak no more them is set down for them:_] Shakespeare alludes to a custom of his time, when the clown, or low comedian, as he would now be called, addressing the audience during the play, entered into a contest of raillery and sarcasm with such spectators as chose to engage with him.]

[Footnote III.55: _Barren spectators_] _i.e._, dull, unapprehensive spectators.]

[Footnote III.56: _Question_] Point, topic.]

[Footnote III.57: _Cop'd withal._] Encountered with.]

[Footnote III.58: _Pregnant hinges of the knee_,] _i.e._, bowed or bent: ready to kneel where _thrift_, that is, thriving, or emolument may follow sycophancy.]

[Footnote III.59: _Since my dear soul_] _Dear_ is out of which arises the liveliest interest.]

[Footnote III.60: _Whose blood and judgment_] Dr. Johnson says that according to the doctrine of the four humours, _desire_ and _confidence_ were seated in the blood, and judgment in the phlegm, and the due mixture of the humours made a perfect character.]

[Footnote III.61: _The very comment of thy soul_] The most intense direction of every faculty.]

[Footnote III.62: _Occulted guilt do not itself unkennel_] Stifled, secret guilt, do not develope itself.]

[Footnote III.63: _As Vulcan's stithy._] A stithy is the smith's shop, as stith is the anvil.]

[Footnote III.64: _In censure of his seeming._] In making our estimate of the appearance he shall put on.]

[Footnote III.65: _I have nothing with this answer; these words are not mine._] _i.e._, they grow not out of mine: have no relation to anything said by me.]

[Footnote III.66: _No, nor mine, now._] They are now anybody's. Dr. Johnson observes, "a man's words, says the proverb, are his own no longer than while he keeps them unspoken."]

[Footnote III.67: _You played once in the university, you say?_] The practice of acting Latin plays in the universities of Oxford and Cambridge is very ancient, and continued to near the middle of the last century.]

[Footnote III.68: _I did enact Julius Cæsar:_] A Latin play on the subject of Cassar's death, was performed at Christ-church, Oxford, in 1582.]

[Footnote III.69: _They stay upon your patience._] _Patience_ is here used for _leisure_.]

[Footnote III.70: _Lying down at Ophelia's feet._] To lie at the feet of a mistress during any dramatic representation, seems to have been a common act of gallantry.]

[Footnote III.71: _Jig-maker_,] Writer of ludicrous interludes. _A jig_ was not in Shakespeare's time only a dance, but a ludicrous dialogue in metre; many historical ballads were also called _jigs_.]

[Footnote III.72: _For I'll have a suit of sables._] Wherever his scene might be, the customs of his country were ever in Shakespeare's thoughts. A suit trimmed with sables was in our author's own time the richest dress worn by men in England. By the Statute of Apparel, 24 Henry VIII., c. 13, (_article furres_), it is ordained, that none under the degree of an _Earl_ may use _sables_.]

[Footnote III.73: _He must build churches, then._] Such benefactors to society were sure to be recorded by means of the feast day on which the patron saints and founders of churches were commemorated in every parish. This custom has long since ceased.]

[Footnote III.74: _Miching mallecho_;] To _mich_ is a provincial word, signifying _to lie hid_, or _to skulk_, or _act by stealth_. It was probably once generally used. Mallecho is supposed to be corrupted from the Spanish _Malechor_, which means a poisoner.]

[Footnote III.75: _The posy of a ring?_] Such poetry as you may find engraven on a ring.]

[Footnote III.76: _Phoebus' cart_] A chariot was anciently called a cart.]

[Footnote III.77: _Tellus' orbèd ground_,] _i.e._, the globe of the earth. Tellus is the personification of the earth, being described as the first being that sprung from Chaos.]

[Footnote III.78: _My operant powers their functions leave to do:_] _i.e._, my active energies cease to perform their offices.]

[Footnote III.79: _What we do determine, oft we break._] Unsettle our most fixed resolves.]

[Footnote III.80: _The argument?_] The subject matter.]

[Footnote III.81: _The mouse-trap._]

He calls it the mouse-trap, because it is the thing, In which he'll catch the conscience of the king.]

[Footnote III.82: _Tropically._] _i.e._, figuratively.]

[Footnote III.83: _The image of a murder_,] _i.e._, the lively portraiture, the correct and faithful representation of a murder, &c.]

[Footnote III.84: _Let the galled jade wince_,] A proverbial saying.]

[Footnote III.85: _Our withers are unwrung._] Withers is the joining of the shoulder bones at the bottom of the neck and mane of a horse. _Unwrung_ is _not pinched_.]

[Footnote III.86: _You are as good as a chorus_,] The persons who are supposed to behold what passes in the acts of a tragedy, and sing their sentiments between the acts.

The use to which Shakespeare converted the chorus, may be seen in King Henry V.]

[Footnote III.87: _I could interpret between you and your love, if I could see the puppets dallying._] This refers to the interpreter, who formerly sat on the stage at all _puppet shows_, and explained to the audience. _The puppets dallying_ are here made to signify to the agitations of Ophelia's bosom.]

[Footnote III.88:

The croaking raven _Doth bellow for revenge._]

_i.e._, begin without more delay; for the raven, foreknowing the deed, is already croaking, and, as it were, calling out for the revenge which will ensue.]

[Footnote III.89: _Midnight weeds_] The force of the epithet _midnight_, will be best displayed by a corresponding passage in Macbeth:

"Root of hemlock, _digg'd i' the dark_."]

[Footnote III.90: _Usurp_] Encroach upon.]

[Footnote III.91: _Let the strucken deer go weep_,] Shakespeare, in _As you like it_, in allusion to the wounded stag, speaks of the _big round tears_ which _cours'd one another down his innocent nose in piteous chase_. In the 13th song of Drayton's Polyolbion, is a similar passage--"_The harte weepeth at his dying; his tears are held to be precious in medicine._"]

[Footnote III.92: _Marvellous distempered._] _i.e._, discomposed.]

[Footnote III.93: _Admiration._] _i.e._, wonder.]

[Footnote III.94: _Trade with us?_] _i.e._ Occasion of intercourse.]

[Footnote III.95: _By these pickers and stealers._] _i.e._, by these hands. The phrase is taken from the Church catechism, where, in our duty to our neighbour, we are taught to keep our hands from _picking and stealing_.]

[Footnote III.96: _You do freely bar the door of your own liberty, if you deny your griefs to your friend._] By your own act you close the way against your own ease, and the free discharge of your griefs, if you open not the source of them to your friends.]

[Footnote III.97: _You have the voice of the king himself for your succession in Denmark?_] Though the crown was elective, yet regard was paid to the recommendation of the preceding prince, and preference given to royal blood, which, by degrees, produced hereditary succession.]

[Footnote III.98: _"While the grass grows,"--the proverb is something musty._] The proverb is, "_While the grass grows, the steed starves._" Hamlet alludes to his own position, while waiting for his succession to the throne of Denmark. A similar adage is, "_A slip between the cup and the lip._"]

[Footnote III.99: _Recorder._] _i.e._ A kind of flute, or pipe.]

[Footnote III.100: _Why do you go about to recover the wind of me_,] Equivalent to our more modern saying of _Get on the blind side._]

[Footnote III.101: _Into a toil?_] _i.e._, net or snare.]

[Footnote III.102: _If my duty be too bold, my love is too unmannerly._] If my sense of duty have led me too far, it is affection and regard for you that makes the carriage of that duty border on disrespect.]

[Footnote III.103: _Govern these ventages--and it will discourse most eloquent music._] Justly order these vents, or air-holes, and it will breathe or utter, &c.]

[Footnote III.104: _Though you can fret me, you cannot play upon me._] A _fret_ is a stop or key of a musical instrument. Here is, therefore, a play upon the words. Though you cannot fret, stop, or vex, you cannot play or impose upon me.]

[Footnote III.105: _They fool me to the top of my bent._] To the height; as far as they see me _incline_ to go: an allusion to the utmost flexure of a bow.]

[Footnote III.106: _Bitter business_] _i.e._, shocking, horrid business.]

[Footnote III.107: _Stands it safe with us_] Is it _consistent_ with our security.]

[Footnote III.108: _This fear_,] Bugbear.]

[Footnote III.109: _Behind the arras I'll convey myself_,] The arras-hangings, in Shakespeare's time, were hung at such a distance from the walls, that a person might easily stand behind them unperceived.]

[Footnote III.110: _To hear the process_;] The course of the conversation.]

[Footnote III.111: _The speech of vantage._] _i.e._, opportunity or advantage of secret observations.]

[Footnote III.112: _Lay home to him:_] Pointedly and closely charge him.]

[Footnote III.113: _Pranks too broad_] Open and bold.]

[Footnote III.114: _I'll 'sconce me even here._] 'Sconce and ensconce are constantly used figuratively for _hide._ In "The Merry Wives of Windsor," Falstaff says, "I will _ensconce_ me behind the arras."]

[Footnote III.115: _By the rood_,] _i.e._, the cross or crucifix.]

[Footnote III.116: _How now! a rat?_] This is an expression borrowed from the History of Hamblet.]

[Footnote III.117: _Have not braz'd it so_,] _i.e._, soldered with brass.]

[Footnote III.118: _Proof and bulwark against sense._] Against all feeling.]

[Footnote III.119: _Takes off the rose From the fair forehead of an innocent love, And sets a blister there_;] _i.e._, takes the clear tint from the brow of unspotted, untainted innocence. "True or honest as the skin between one's brows" was a proverbial expression, and is frequently used by Shakespeare.]

[Footnote III.120: _As from the body of contraction plucks The very soul_;] Annihilates the very principle of contracts. Contraction for marriage contract.]

[Footnote III.121: _The counterfeit presentment_] _i.e._, picture or mimic representation.]

[Footnote III.122: _Hypérion's curls_;] Hyperion is used by Spenser with the same error in quantity.]

[Footnote III.123: _A station like the herald Mercury_] Station is attitude--act of standing.]

[Footnote III.124:

Like a mildew'd ear, _Blasting his wholesome brother._]

This alludes to Pharaoh's dream, in the 41st chapter of Genesis.]

[Footnote III.125: _Batten on this moor?_] Batten is to feed rankly.]

[Footnote III.126: _Hey-day in the blood_] This expression is occasionally used by old authors.]

[Footnote III.127: _Thou canst mutine_] _i.e._, rebel.]

[Footnote III.128: _As will not leave their tinct._] So dyed _in grain_, that they will not relinquish or lose their tinct--are not to be discharged. In a sense not very dissimilar he presently says,

"Then what I have to do Will _want true colour_."]

[Footnote III.129: _An enseamed bed._] _i.e._, greasy bed of grossly fed indulgence.]

[Footnote III.130: _A vice of kings_;] _i.e._, a low mimick of kings. The vice was the fool of the old moralities or dramas, who was generally engaged in contests with the devil, by whom he was finally carried away. Dr. Johnson says the modern Punch is descended from the vice.]

[Footnote III.131:

From a shelf the precious diadem stole, _And put it in his pocket!_]

In allusion to the usurper procuring the crown as a common pilferer or thief, and not by open villainy that carried danger with it.]

[Footnote III.132: _A king of shreds and patches._] This is said, pursuing the idea of the _vice of kings_. The vice being dressed as a fool, in a coat of party-coloured patches.]

[Footnote III.133: _Laps'd in time and passion_,] That having suffered time to slip, and passion to cool, &c. It was supposed that nothing was more offensive to apparitions than the neglect to attach importance to their appearance, or to be inattentive to their admonitions.]

[Footnote III.134: _Cool patience._] _i.e._, moderation.]

[Footnote III.135: _Make them capable._] Make them intelligent--capable of conceiving.]

[Footnote III.136: _My stem effects:_] _i.e._, change the nature of my purposes, or what I mean to effect.]

[Footnote III.137: _Nothing at all; yet all that is, I see._] It is in perfect consistency with the belief that all spirits were not only naturally invisible, but that they possessed the power of making themselves visible to such persons only as they pleased.]

[Footnote III.138: _My father, in his habit as he lived!_] In the habit he was accustomed to wear when living.]

[Footnote III.139:

This bodiless creation ecstasy _Is very cunning in._]

_i.e._, "Such shadows are the weak brain's forgeries." Ecstasy in this place, as in many others, means a temporary alienation of mind--a fit.]

[Footnote III.140: _Gambol from._] Start away from.]

[Footnote III.141: _Skin and film_,] Cover with a thin skin.]

[Footnote III.142:

And when you are desirous to be bless'd, _I'll blessing beg of you_]

When you are desirous to receive a blessing from heaven (which you cannot, seriously, till you reform), I will beg to receive a blessing from you.]

ACT IV.

SCENE I.--A ROOM IN THE CASTLE.

Enter KING _and_ QUEEN, _from_ (R.H.) _centre._

King. There's matter in these sighs, these profound heaves: You must translate:[1] 'tis fit we understand them. How does Hamlet?

Queen. Mad as the sea and wind, when both contend Which is the mightier: In his lawless fit, Behind the arras hearing something stir, Whips out his rapier, cries _A rat, a rat!_ And, in this brainish apprehension,[2] kills The unseen good old man.

King. O heavy deed! It had been so with us, had we been there: Where is he gone?

Queen. To draw apart the body he hath kill'd.

King. The sun no sooner shall the mountains touch, But we will ship him hence: and this vile deed We must, with all our majesty and skill, Both countenance and excuse.--Ho, Guildenstern!

Enter ROSENCRANTZ _and_ GUILDENSTERN (L.H.)

Friends both, go join you with some further aid: Hamlet in madness hath Polonius slain, And from his mother's closet hath he dragg'd him: Go seek him out; speak fair, and bring the body Into the chapel.

[ROSENCRANTZ _and_ GUILDENSTERN _cross to_ R.]

I pray you, haste in this.

[_Exeunt_ ROSENCRANTZ _and_ GUILDENSTERN, R.H.]

Go, Gertrude, we'll call up our wisest friends; And let them know, both what we mean to do, And what's untimely done.

[_Exit_ QUEEN, R.C.]

How dangerous is it that this man goes loose! Yet must not we put the strong law on him: He's lov'd of the distracted multitude, Who like not in their judgment, but their eyes; And where 'tis so, the offender's scourge is weigh'd, But never the offence.[3]

Enter ROSENCRANTZ (R.)

How now! what hath befallen?

Ros. Where the dead body is bestowed, my lord, We cannot get from him.

King. But where is he?

Ros. Without, my lord; guarded, to know your pleasure.

King. Bring him before us.

Ros. Ho, Guildenstern! bring in my lord.

Enter HAMLET, GUILDENSTERN, _and_ Attendants (R.H.)

King. (C.) Now, Hamlet, where's Polonius?

Ham. (R.) At supper.

King. At supper? Where?

Ham. Not where he eats, but where he is eaten: a certain convocation of politick worms[4] are e'en at him.

King. Where's Polonius?

Ham. In Heaven; send thither to see: if your messenger find him not there, seek him i'the other place yourself. But, indeed, if you find him not within this month, you shall nose him as you go up the stairs into the lobby.

King. Go seek him there.

[_To_ GUILDENSTERN.]

Ham. He will stay till you come.

[_Exit_ GUILDENSTERN, R.H.]

King. Hamlet, this deed, for thine especial safety, Must send thee hence: Therefore prepare thyself; The bark is ready, and the wind at help,[5] For England.

Ham. For England!

King. Ay, Hamlet.

Ham. Good.

King. So is it, if thou knew'st our purposes.

Ham. I see a cherub that sees them. But, come; for England!--Farewell, dear mother.

King. Thy loving father, Hamlet.

Ham. My mother: Father and mother is man and wife; man and wife is one flesh; and so, my mother. Come, for England.

[_Exit_, R.H.]

King. Follow him at foot; tempt him with speed aboard; Away! for everything is seal'd and done.

[_Exeunt_ ROSENCRANTZ _and_ Attendants, R.H.]

And, England, if my love thou hold'st at aught, Thou may'st not coldly set[6] Our sovereign process;[7] which imports at full, By letters conjuring to that effect,[8] The present death of Hamlet. Do it, England; For thou must cure me: 'Till I know 'tis done, Howe'er my haps,[9] my joys will ne'er begin.

[_Exit_ KING, L.H.]

Enter QUEEN _and_ HORATIO (R. _centre._)

Queen. ----I will not speak with her.

Hor. She is importunate; indeed, distract: 'Twere good she were spoken with; for she may strew Dangerous conjectures in ill-breeding minds.

Queen. Let her come in.

[_Exit_ HORATIO, R.C.]

Re-enter HORATIO, _with_ OPHELIA (R. _centre._)

Oph. Where is the beauteous majesty of Denmark?

Queen. How now, Ophelia!

Oph. (C.)

[_Singing._]

How should I your true love know _From another one?_ _By his cockle hat and staff_, _And his sandal shoon._[10]

Queen. (L.C.) Alas, sweet lady, what imports this song?

Oph. Say you? nay, pray you, mark.

[_Sings._]

He is dead and gone, lady, _He is dead and gone_; _At his head a grass-green turf_, _At his heels a stone._

Enter the KING (L.H.)

Queen. Nay, but, Ophelia,----

Oph. Pray you, mark.

[_Sings._]

White his shroud as the mountain-snow, _Larded all with sweet flowers_;[11] _Which bewept to the grave did go_ _With true-love showers._

King. How do you, pretty lady?

Oph. Well, Heaven 'ield you![12]

(_Crosses to the_ KING.)

They say the owl was a baker's daughter.[13] We know what we are, but know not what we may be.

King. Conceit upon her father.[14]

Oph. Pray, you, let us have no words of this; but when they ask you what it means, say you this:

To-morrow is Saint Valentine's day, _All in the morning betime_, _And I, a maid at your window_, _To be your Valentine:_

King. Pretty Ophelia!

Oph. Indeed, without an oath, I'll make an end on't:

Then up he rose, and don'd his clothes, _And dupp'd[15] the chamber door_; _Let in the maid, that out a maid_ _Never departed more._

[_Crosses to_ R.H.]

King. (L.) How long hath she been thus?

Oph. (R.) I hope all will be well. We must be patient: but I cannot choose but weep, to think they should lay him i'the cold ground. My brother shall know of it; and so I thank you for your good counsel. Come, my coach! Good night, ladies; good night, sweet ladies; good night, good night.

[_Exit_, R.C.]

King. Follow her close; give her good watch, I pray you.

[_Exit_ HORATIO, _through centre_ R.]

O! this is the poison of deep grief; it springs All from her father's death. O, Gertrude, Gertrude, When sorrows come, they come not single spies, But in battalions!

Enter MARCELLUS (R. _centre._)

King. What is the matter?

Mar. Save yourself, my lord: The young Laertes, in a riotous head,[16] O'erbears your officers. The rabble call him lord; They cry, _Choose we: Laertes shall be king!_ Caps, hands, and tongues, applaud it to the clouds, _Laertes shall be king, Laertes king!_

[_Noise within_, R.C.]

Enter LAERTES, _armed_; Danes _following_ (R. _centre._)

Laer. Where is this king?--Sirs, stand you all without.

Dan. No, let's come in.

Laer. I pray you, give me leave.

Dan. We will, we will.

[_They retire without_, R.H.]

Laer. O, thou vile king, Give me my father.

Queen

(_Interposing._)

Calmly, good Laertes.

Laer. (R.) That drop of blood that's calm proclaims me bastard; Cries cuckold to my father; brands the harlot Even here, between the chaste unsmirched brow Of my true mother.[17]

King. (L.) What is the cause, Laertes, That thy rebellion looks so giant-like? Let him go, Gertrude; do not fear our person: There's such divinity doth hedge a king,[18] That treason can but peep to what it would, Acts little of his will. Let him go, Gertrude.

[QUEEN _obeys._]

Laer. Where is my father?

King. Dead.

Queen. But not by him.

King. Let him demand his fill.

Laer. How came he dead? I'll not be juggled with: To hell, allegiance! To this point I stand, That both the worlds I give to negligence,[19] Let come what comes; only I'll be reveng'd Most throughly for my father.

King. Who shall stay you!

Laer. My will, not all the world's:[20] And, for my means, I'll husband them so well, They shall go far with little.

King. Good Laertes, That I am guiltless of your father's death, And am most sensible in grief[21] for it, It shall as level to your judgment 'pear As day does to your eye.

Hor.

(_Without._)

Oh, poor Ophelia!

King. Let her come in.

Enter OPHELIA (R.C.), _fantastically dressed with Straws and Flowers._

Laer.

(_Goes up_ L.C.)

O rose of May! Dear maid, kind sister, sweet Ophelia! O heavens! is't possible, a young maid's wits Should be as mortal as an old man's life?

Oph. (R.C.)

They bore him barefac'd on the bier; _And on his grave rain many a tear,--_

Fare you well, my dove!

Laer.

(_Coming down_ R.)

Hadst thou thy wits, and didst persuade revenge, It could not move thus.

Oph. You must sing, _Down-a-down,[22] an you call him a-down-a._ O, how well the wheel becomes it![23] It is the false steward, that stole his master's daughter.

Laer. This nothing's more than matter.

Oph. There's rosemary, that's for remembrance;[24] pray you, love, remember: and there is pansies,[25] that's for thoughts.

Laer. A document in madness; thoughts and remembrance fitted.

Oph. There's fennel for you,

(_crosses to the_ KING _on_ L.H.)

and columbines:[26] there's rue for you;

(_turns to the_ QUEEN, _who is_ R.C.)

and here's some for me:--we may call it herb of grace o'Sundays:[27]--you may wear your rue with a difference.[28]--There's a daisy:[29]--I would give you some violets,[30] but they withered all when my father died:--They say he made a good end,----

For bonny sweet Robin is all my joy--[31]

Laer. (R.) Thought and affliction,[32] passion, hell itself, She turns to favour and to prettiness.

Oph.

And will he not come again? _And will he not come again?_ _No, no, he is dead_, _Gone to his death-bed_, _He never will come again._

His beard was white as snow, _All flaxen was his poll:_ _He is gone, he is gone_, _And we cast away moan:_ _Heaven 'a mercy on his soul!_

And of all christian souls, I pray Heaven. Heaven be wi' you.

[_Exit_ OPHELIA, R.C., QUEEN _following._]

Laer. Do you see this, O Heaven?

King. (L.C.) Laertes, I must commune with your grief,[33] Or you deny me right. Be you content to lend your patience to us, And we shall jointly labour with your soul To give it due content.

Laer. (R.C.) Let this be so; His means of death, his obscure funeral,-- No trophy, sword, nor hatchment o'er his bones,[34] No noble rite nor formal ostentation,-- Cry to be heard,[35] as 'twere from heaven to earth, That I must call't in question.

King. So you shall; And where the offence is let the great axe fall.[36] How now! what news?

Enter BERNARDO (R.H.C.)

Ber. (C.) Letters, my lord, from Hamlet: This to your majesty; this to the Queen.

King. From Hamlet! who brought them?

Ber. Sailors, my lord, they say; I saw them not.

King. Laertes, you shall hear them.-- Leave us.

[_Exit_, L.H.C.] [Reads.]

High and mighty, You shall know I am set naked on your kingdom.[37] To morrow shall I beg leave to see your kingly eyes: when I shall, first asking your pardon thereunto, recount the occasion of my sudden and more strange return. HAMLET.

What should this mean? Are all the rest come back? Or is it some abuse, and no such thing?

Laer. (R.) Know you the hand?

King. (L.) 'Tis Hamlet's character:[38] _Naked,--_

And in a postscript here, he says, _alone_. Can you advise me?

Laer. I am lost in it, my lord. But let him come; It warms the very sickness in my heart, That I shall live and tell him to his teeth, _Thus diddest thou_.

King. If it be so, Laertes, Will you be rul'd by me?

Laer. Ay, my lord; So you will not o'er-rule me to a peace.

King. To thine own peace. Some two months since, Here was a gentleman of Normandy, He made confession of[39] you; And gave you such a masterly report, For art and exercise in your defence,[40] And for your rapier most especially, That he cried out, 'twould be a sight indeed, If one could match you: this report of his Did Hamlet so envenom with his envy, That he could nothing do but wish and beg Your sudden coming o'er, to play with you. Now, out of this,----

Laer. What out of this, my lord?

King. Laertes, was your father dear to you? Or are you like the painting of a sorrow, A face without a heart?

Laer. Why ask you this?

King. Hamlet return'd shall know you are come home: We'll put on those shall praise your excellence, And set a double varnish on the fame The Frenchman gave you; bring you, in fine, together, And wager o'er your heads; he, being remiss,[41] Most generous, and free from all contriving, Will not peruse the foils:[42] so that, with ease, Or with a little shuffling, you may choose A sword unbated,[43] and, in a pass of practice,[44] Requite him for your father.

Laer. I will do't: And, for the purpose, I'll anoint my sword. I bought an unction of a mountebank, So mortal, that but dip a knife in it, Where it draws blood no cataplasm[45] so rare, Collected from all simples[46] that have virtue Under the moon, can save the thing from death That is but scratch'd withal: I'll touch my point With this contagion, that, if I gall him slightly, It may be death.

King. (L.) Let's further think of this; We'll make a solemn wager on your cunnings,[47] When in your motion[48] you are hot and dry, (As make your bouts more violent to that end,) And that he calls for drink, I'll have prepared him A chalice for the nonce;[49] whereon but sipping, If he by chance escape your venom'd stuck,[50] Our purpose may hold there. But stay, what noise?

Enter QUEEN (R.C.)

Queen. (C.) One woe doth tread upon another's heel, So fast they follow: Your sister's drown'd, Laertes.

Laer. (R.) Drown'd! O, where?

Queen. There is a willow grows aslant a brook, That shows his hoar leaves in the glassy stream; Therewith fantastick garlands did she make Of crow-flowers, nettles, daisies, and long purples;[51] There, on the pendent boughs her cornet weeds Clambering to hang, an envious sliver broke; When down her weedy trophies, and herself, Fell in the weeping brook.

Laer. I forbid my tears: But yet It is our trick:[52] nature her custom holds, Let shame say what it will: when these are gone, The woman will be out.[53] Adieu, my lord: I have a speech of fire, that fain would blaze, But that this folly drowns it.[54]

[_Exeunt._ C.]

END OF ACT FOURTH.

Notes

Act IV

[Footnote IV.1: _Translate:_] Interpret.]

[Footnote IV.2: _In this brainish apprehension_,] Distempered, brainsick mood.]

[Footnote IV.3: _Where the offender's scourge is weigh'd, But never the offence._] When an offender is popular, the people never consider what his crime was, but they scrutinise his punishment.]

[Footnote IV.4: _Politick worms_] _i.e._, artful, cunning worms.]

[Footnote IV.5: _The wind at help_,] _i.e._, ready.]

[Footnote IV.6: _May'st not coldly set_] Set is to value or estimate. "Thou may'st not _set little by it_, or _estimate it lightly_."]

[Footnote IV.7: _Our sovereign process:_] _i.e._, our royal design.]

[Footnote IV.8: _By letters conjuring to that effect_,] The verb to conjure, in the sense of to supplicate, was formerly accented on the first syllable.]

[Footnote IV.9: _Howe'er my haps_,] Chances of fortune.]

[Footnote IV.10: _His sandal shoon._] Shoon is the old plural of shoe. The verse is descriptive of a pilgrim. While this kind of devotion was in favour, love intrigues were carried on under that mask.]

[Footnote IV.11: _Larded with sweet flowers_;] _i.e._, Garnished with sweet flowers.]

[Footnote IV.12: _Heaven 'ield you._] Requite; yield you recompence.]

[Footnote IV.13: _The owl was a baker's daughter._] This is in reference to a story that was once prevalent among the common people of Gloucestershire.]

[Footnote IV.14: _Conceit upon her father._] Fancies respecting her father.]

[Footnote IV.15: _Don'd and dupp'd_] _To don_, is to _do on_, or _put on_, as _doff_ is to _do off_, or _put off_. To _dupp_ is to _do up_, or _lift up_ the latch.]

[Footnote IV.16: _In a riotous head_,] The tide, strongly flowing, is said to pour in with a great _head_.]

[Footnote IV.17: _The chaste unsmirched brow of my true mother._] _Unsmirched_ is unstained, not defiled.]

[Footnote IV.18: _Doth hedge a king_,] The word _hedge_ is used by the gravest writers upon the highest subjects.]

[Footnote IV.19: _Both the worlds I give to negligence_,] I am careless of my present and future prospects, my views in this life, as well as that which is to come.]

[Footnote IV.20: _My will, not all the world's:_] _i.e._, by my will as far as my will is concerned, not all the world shall stop me; and, as for my means, I'll husband them so well, they shall go far, though really little.]

[Footnote IV.21: _Sensible in grief_] Poignantly affected with.]

[Footnote IV.22: _You must sing Down-a-down_,] This was the burthen of an old song, well known in Shakespeare's time.]

[Footnote IV.23: _How well the wheel becomes it!_] This probably means that the song or charm is well adapted to those who are occupied at spinning at the wheel.]

[Footnote IV.24: _There's rosemary, that's for remembrance_;] Rosemary was anciently supposed to strengthen the memory, and was carried at funerals and wore at weddings. It was also considered the emblem of fidelity in lovers; and at weddings it was usual to dip the rosemary in the cup, and drink to the health of the new married couple.]

[Footnote IV.25: _There is pansies_,] _i.e._, a little flower called _heart's-ease_. Pansies in French signifies _thoughts_.]

[Footnote IV.26: _There's fennel for you, and columbines:_] Fennel was considered an emblem of flattery, and columbine was anciently supposed to be a _thankless flower_; signifying probably that the courtiers flattered to get favours, and were thankless after receiving them. Columbine was emblematical of forsaken lovers.]

[Footnote IV.27: _There's rue for you; and here's some for me:--we may call it herb of grace o' Sundays:_] Probably a quibble is meant here, as _rue_ anciently signified the same as _ruth_, _i.e._, sorrow. In the common dictionaries of Shakespeare's time, it was called _herb of grace_. Ophelia wishes to remind the Queen of the sorrow and contrition she ought to feel for her unlawful marriage; and that she may wear her rue with peculiar propriety on Sundays, when she solicits pardon for the crime which she has so much occasion to _rue_ and repent of.--MALONE.]

[Footnote IV.28: _You may wear your rue with a difference._] _i.e._, to distinguish it from that worn by Ophelia, herself: because her tears flowed from the loss of a father--those of the Queen ought to flow for her guilt.]

[Footnote IV.29: _There's a daisy:_] A daisy signified a warning to young women, not to trust the fair promises of their lovers.]

[Footnote IV.30: _I would give you some violets_,] Violets signified faithfulness.]

[Footnote IV.31: _For bonny sweet Robin is all my joy,--_] Part of an old song.]

[Footnote IV.32: _Thought and affliction_,] Thought here, as in many other places, means melancholy.]

[Footnote IV.33: _I must commune with your grief_,] _i.e._, confer, discuss, or argue with.]

[Footnote IV.34: _No trophy, sword, nor hatchment o'er his bones_,] Not only the sword, but the helmet, gauntlet, spurs, and tabard, (_i.e._, a coat whereon the armorial ensigns were anciently depicted, from whence the term _coat_ of armour), are hung over the grave of every knight.]

[Footnote IV.35: _Cry to be heard_,] All these multiplied incitements are things which cry, &c.]

[Footnote IV.36: _Let the great axe fall._] _i.e._, the axe that is to be laid to the root.]

[Footnote IV.37: _Naked on your kingdom_,] _i.e._, unprovided and defenceless.]

[Footnote IV.38: _'Tis Hamlet's character_,] Peculiar mode of shaping his letters.]

[Footnote IV.39: _Made confession of_] Acknowledged.]

[Footnote IV.40: _In your defence_,] _i.e._, "in your art and science of defence."]

[Footnote IV.41: _He, being remiss_,] _i.e._, unsuspicious, not cautious.]

[Footnote IV.42: _Peruse the foils_;] Closely inspect them.]

[Footnote IV.43: _A sword unbated_,] Not blunted, as foils are by a button fixed to the end.]

[Footnote IV.44: _In a pass of practice_,] This probably means some favourite pass, some trick of fencing, with which Hamlet was inexperienced, and by which Laertes may be sure of success.]

[Footnote IV.45: _No cataplasm_,] _i.e._, poultice--a healing application.]

[Footnote IV.46: _Collected from all simples_,] _i.e._, from all ingredients in medicine.]

[Footnote IV.47: _On your cunnings_,] _i.e._, on your dexterity.]

[Footnote IV.48: _In your motion_] Exercise, rapid evolutions.]

[Footnote IV.49: _For the nonce_;] _i.e._, present purpose or design.]

[Footnote IV.50: _Venom'd stuck_,] Thrust. Stuck was a term of the fencing school.]

[Footnote IV.51: _Long purples_,] One of the names for a species of orchis, a common English flower.]

[Footnote IV.52: _Our trick:_] Our course, or habit; a property that clings to, or makes a part of, us.]

[Footnote IV.53:

When these are gone, _The woman will be out._]

When these tears are shed, this womanish passion will be over.]

[Footnote IV.54: _But that this folly drowns it._] _i.e._, my rage had flamed, if this flood of tears had not extinguished it.]

ACT V.

SCENE I.--A CHURCH YARD.

Enter two Clowns,[1] _with spades, &c._ (L.H.U.E.)

1st Clo. (R.) Is she to be buried in christian burial that wilfully seeks her own salvation?

2nd Clo. (L.) I tell thee she is; therefore make her grave straight:[2] the crowner[3] hath set on her, and finds it christian burial.

1st Clo. How can that be, unless she drowned herself in her own defence?

2nd Clo. Why, 'tis found so.

1st Clo. It must be _se offendendo_;[4] it cannot be else. For here lies the point: If I drown myself wittingly, it argues an act: and an act hath three branches; it is, to act, to do, and to perform:[5] argal,[6] she drowned herself wittingly.

2nd Clo. Nay, but hear you, goodman delver.[7]

1st Clo. Give me leave. Here lies the water; good: here stands the man; good: If the man go to this water, and drown himself, it is, will he, nill he, he goes,[8] mark you that; but if the water come to him and drown him, he drowns not himself: argal, he that is not

guilty of his own death shortens not his own life.

2nd Clo. But is this law?

1st Clo. Ay, marry is't; crowner's-quest law.[9]

2nd Clo. Will you ha' the truth on't? If this had not been a gentlewoman, she should have been buried out of christian burial.

1st Clo. Why, there thou say'st:[10] And the more pity that great folks should have countenance in this world to drown or hang themselves, more than their even christian.[11] Come, my spade. There is no ancient gentlemen but gardeners, ditchers, and grave-makers: they hold up Adam's profession.

2nd Clo. Was he a gentleman?[12]

1st Clo. He was the first that ever bore arms. I'll put another question to thee: if thou answerest me not to the purpose, confess thyself----[13]

2nd Clo. Go to.

1st Clo. What is he that builds stronger than either the mason, the shipwright, or the carpenter?

2nd Clo. The gallows-maker; for that frame outlives a thousand tenants.

1st Clo. I like thy wit well, in good faith: the gallows does well; But how does it well? it does well to those that do ill: now, thou dost ill to say the gallows is built stronger than the church: argal, the gallows may do well to thee. To't again, come.

2nd Clo. Who builds stronger than a mason, a shipwright, or a carpenter?

1st Clo. Ay, tell me that, and unyoke.[14]

2nd Clo. Marry, now I can tell.

1st Clo. To't.

2nd Clo. Mass, I cannot tell.

1st Clo. Cudgel thy brains no more about it,[15] for your dull ass will not mend his pace with beating; and, when you are asked this question next, say, a grave-maker, the houses that he makes, last till doomsday. Go, get thee to Yaughan, and fetch me a stoup of liquor.[16]

[_Exit_ 2nd Clown, L.H.U.E.]

Enter HAMLET _and_ HORATIO (L.H.U.E.)

First Clown _digs and sings._

In youth, when I did love, did love,[17] _Methought, it was very sweet_, _To contract, O, the time, for, ah, my behove_ _O, methought, there was nothing meet._

Ham.

(_Behind the grave._)

Has this fellow no feeling of his business, he sings at grave-making?

Hor.

(_On_ HAMLET'S R.)

Custom hath made it in him a property of easiness.

Ham. 'Tis e'en so: the hand of little employment hath the daintier sense.[18]

1st Clo. _But age, with his stealing steps_, _Hath clawed me in his clutch_, _And hath shipped me into the land_, _As if I had never been such._

[_Throws up a skull._]

Ham. That skull had a tongue in it, and could sing once: How the knave jowls it to the ground, as if it were Cain's jaw-bone, that did the first murder! This might be the pate of a politician, which this ass now o'er-reaches; one that would circumvent Heaven, might it not?

Hor. It might, my lord.

[_Gravedigger throws up bones._]

Ham. Did these bones cost no more the breeding, but to play at loggats with them?[19] mine ache to think on't.

1st Clo.

[_Sings._]

A pick-axe and a spade, a spade, _For and a shrouding sheet:_[20] _O, a pit of clay for to be made_ _For such a guest is meet._

[_Throws up a skull._

Ham. There's another: Why may not that be the skull of a lawyer? Where be his quiddits now, his quillets,[21] his cases, his tenures, and his tricks? Why does he suffer this rude knave now to knock him about the sconce[22] with a dirty shovel, and will not tell him of his action of battery? I will speak to this fellow.--Whose grave's this, sirrah?

1st Clo. Mine, sir.--

[_Sings._]

O, a pit of clay for to be made _For such a guest is meet._

Ham. (R. _of grave._) I think it be thine, indeed; for thou liest in't.

1st Clo. You lie out on't, sir, and therefore it is not yours: for my part, I do not lie in't, yet it is mine.

Ham. Thou dost lie in't, to be in't, and say it is thine: 'tis for the dead, not for the quick; therefore thou liest.

1st. Clo. 'Tis a quick lie, sir; 'twill away again, from me to you.

Ham. What man dost thou dig it for?

1st Clo. For no man, sir.

Ham. What woman, then?

1st Clo. For none, neither.

Ham. Who is to be buried in't?

1st Clo. One that was a woman, sir; but, rest her soul, she's dead.

Ham. How absolute the knave is![23] we must speak by the card,[24] or equivocation will undo us,

[_To_ HORATIO, R.]

How long hast thou been a grave-maker?

1st Clo. Of all the days i'the year, I came to't that day that our last king Hamlet overcame Fortinbras.

Ham. How long's that since?

1st Clo. Cannot you tell that? every fool can tell that: It was the very day that young Hamlet was born,[25] he that is mad, and sent into England.

Ham. Ay, marry, why was he sent into England?

1st Clo. Why, because he was mad: he shall recover his wits there; or, if he do not, 'tis no great matter there.

Ham. Why?

1st Clo. 'Twill not be seen in him there; there the men are as mad as he.

Ham. How came he mad?

1st Clo. Very strangely, they say.

Ham. How strangely?

1st Clo. 'Faith, e'en with losing his wits.

Ham. Upon what ground?

1st Clo. Why, here in Denmark: I have been sexton here, man and boy, thirty years.

Ham. How long will a man lie i'the earth ere he rot?

1st Clo. 'Faith, if he be not rotten before he die, he will last you some eight year or nine year: a tanner will last you nine year.

Ham. Why he more than another?

1st Clo. Why, sir, his hide is so tanned with his trade, that he will keep out water a great while; and your water is a sore decayer of your ill-begotten dead body. Here's a skull now, hath lain in the earth three-and-twenty years.

Ham. Whose was it?

1st Clo. O, a mad fellow's it was: Whose do you think it was?

Ham. Nay, I know not.

1st Clo. A pestilence on him for a mad rogue! he poured a flagon of Rhenish on my head once. This same skull, sir, was Yorick's skull, the king's jester.

Ham. This?

[_Takes the skull._]

1st Clo. E'en that.

Ham. Alas, poor Yorick! I knew him, Horatio: a fellow of infinite jest, of most excellent fancy: he hath borne me on his back a thousand times. Here hung those lips that I have kissed I know not how oft; and now, how abhorred in my imagination it is! Where be your gibes now? your gambols? your songs? your flashes of merriment, that were wont to set the table on a roar? Not one now, to mock your own grinning? Quite chap-fallen? Now get you to my lady's chamber, and tell her, let her paint an inch thick, to this favour[26] she must come; make her laugh at that. Prithee, Horatio, tell me one thing.

Hor. What's that, my lord?

Ham. Dost thou think Alexander look'd o'this fashion i'the earth?

Hor. E'en so.

Ham. And smelt so? pah!

[_Gives the skull to HORATIO, who returns it to the grave-digger._]

Hor. E'en so, my lord.

Ham. To what base uses may we return, Horatio! Why may not imagination trace the noble dust of Alexander, till it find it stopping a bung-hole?

Hor. 'Twere to consider too curiously,[27] to consider so.

Ham. No, faith, not a jot; but to follow him thither with modesty enough, and likelihood to lead it: As thus; Alexander died, Alexander was buried, Alexander returneth to dust; the dust is earth; of earth we make loam; And why of that loam, whereto he was converted, might they not stop a beer barrel?

Imperial Cæsar,[28] dead and turn'd to clay, Might stop a hole to keep the wind away: O, that the earth, which kept the world in awe, Should patch a wall to expel the winter's flaw![29]

But soft! but soft! aside: Here comes the king, The queen, the courtiers: Who is this they follow? And with such maimèd rites?[30] This doth betoken The corse they follow did with desperate hand Fordo its own life:[31] 'Twas of some estate.[32] Couch we awhile, and mark.

[_Retiring with_ HORATIO, R.H.]

Enter Priests, &c., _in procession; the corpse of_ OPHELIA, LAERTES _and_ Mourners _following_; KING, QUEEN, _their_ Trains, _&c._

Laer.

(L. _of the grave._)

What ceremony else?

Ham. (R.) That is Laertes, A very noble youth.

1st Priest.

(R. _of the grave._)

Her obsequies have been as far enlarg'd As we have warranty: Her death was doubtful; And, but that great command o'ersways the order,[33] She should in ground unsanctified have lodged Till the last trumpet; for charitable prayers, Shards,[34] flints, and pebbles, should be thrown on her: Yet here she is allowed her virgin crants,[35] Her maiden strewments, and the bringing home Of bell and burial.[36]

Laer. Must there no more be done?

1st Priest. No more be done: We should profane the service of the dead To sing a _requiem_,[37] and such rest to her As to peace-parted souls.

Laer. O, from her fair and unpolluted flesh May violets spring! I tell thee, churlish priest,[38] A ministering angel shall my sister be, When thou liest howling.

Ham. What, the fair Ophelia!

Queen.

(_Behind the grave_, C. _with the_ KING.)

Sweets to the sweet: Farewell!

[_Scattering flowers._]

I hop'd thou shouldst have been my Hamlet's wife; I thought thy bride-bed to have deck'd, sweet maid, And not have strew'd thy grave.

Laer. O, treble woe Fall ten times treble on that cursed head, Whose wicked deed thy most ingenious sense[39] Depriv'd thee of!--Hold off the earth a while, Till I have caught her once more in mine arms:

[_Leaps into the grave._]

Now pile your dust upon the quick and dead, Till of this flat a mountain you have made, To o'ertop old Pelion,[40] or the skyish head Of blue Olympus.

Ham.

(_Advancing._)

What is he whose grief Bears such an emphasis?--whose phrase of sorrow Conjures the wand'ring stars, and makes them stand Like wonder-wounded hearers?--this is I, Hamlet the Dane.

Laer.

(L., _leaping from the grave._)

The devil take thy soul!

[_Grappling with him._]

Ham. (R.C.) Thou pray'st not well. I prithee, take thy fingers from my throat; For, though I am not splenetive and rash, Yet have I in me something dangerous, Which let thy wisdom fear: Hold off thy hand!

King. Pluck them asunder.

Queen. (C.) Hamlet, Hamlet!

Ham. (R.C.) Why, I will fight with him upon this theme Until my eyelids will no longer wag.

Queen. O my son, what theme?

Ham. I lov'd Ophelia: forty thousand brothers Could not, with all their quantity of love, Make up my sum.--What wilt thou do for her?

Queen. O, he is mad, Laertes.

Ham. Come, show me what thou'lt do: Wou'lt weep? wou'lt fight? wou'lt fast? wou'lt tear thyself? I'll do't.--Dost thou come here to whine? To outface me[41] with leaping in her grave? Be buried quick with her, and so will I: And, if thou prate of mountains, let them throw Millions of acres on us, till our ground,[42] Singeing his pate against the burning zone, Make Ossa[43] like a wart! Nay, an thou'lt mouth, I'll rant as well as thou.

Queen. This is mere madness: And thus a while the fit will work on him; Anon, as patient as the female dove, When that her golden couplets are disclos'd,[44] His silence will sit drooping.

Ham. Hear you, sir; What is the reason that you use me thus? I lov'd you ever: But it is no matter; Let Hercules himself do what he may, The cat will mew,[45] and dog will have his day.

[_Exit_, R.H.]

King. (C.) I pray thee, good Horatio, wait upon him.

[_Exit_ HORATIO, R.H.]

Good Gertrude, set some watch over your son,

[_Exit_ QUEEN, _attended_, R.H.]

Strengthen your patience in our last night's speech;[46]

[_To_ LAERTES.]

We'll put the matter to the present push.-- This grave shall have a living monument:[47] An hour of quiet shortly shall we see; Till then, in patience our proceeding be.

[_The characters group round the grave._]

SCENE II.--HALL IN THE CASTLE.

Enter HAMLET _and_ HORATIO (R.H.)

Ham. But I am very sorry, good Horatio, That to Laertes I forgot myself; For by the image of my cause,[48] I see The portraiture of his.

Hor. Peace! who comes here?

Enter OSRIC (L.H.)

Osr. Your lordship is right welcome back to Denmark.

Ham. (C.) I humbly thank you, sir.--Dost know this water-fly?[49]

Hor. (R.) No, my good lord.

Ham. Thy state is the more gracious; for 'tis a vice to know him.

Osr. (L.) Sweet lord, if your lordship were at leisure, I should impart a thing to you from his majesty.

Ham. I will receive it, sir, with all diligence of spirit.[50] Your bonnet to his right use; 'tis for the head.

Osr. I thank your lordship, 'tis very hot.

Ham. No, believe me, 'tis very cold; the wind is northerly.

Osr. It is indifferent cold, my lord, indeed.

Ham. But yet, methinks it is very sultry and hot,[51] for my complexion,--

Osr. Exceedingly, my lord; it is very sultry, as 'twere,--I cannot tell how.--But, my lord, his majesty bade me signify to you, that he has laid a great wager on your head: Sir, this is the matter,--

Ham. I beseech you, remember----

[HAMLET _moves him to put on his hat._]

Osr. Nay, good my lord; for mine ease, in good faith.[52] Sir, here is newly come to court Laertes; believe me, an absolute gentleman, full of most excellent differences, of very soft society and great showing:[53] Indeed, to speak feelingly of him,[54] he is the card or calendar of gentry,[55] for you shall find in him the continent of what part a gentleman would see.[56]

Ham. What imports the nomination of this gentleman?[57]

Osr. Of Laertes?

Ham. Of him, sir.

Osr. Sir, you are not ignorant of what excellence Laertes is--

Ham. I dare not confess that, lest I should compare with him in excellence; but, to know a man well, were to know himself.[58]

Osr. I mean, sir, for his weapon.

Ham. What is his weapon?

Osr. Rapier and dagger.

Ham. That's two of his weapons: but, well.

Osr. The king, sir, hath wagered with him six Barbary horses: against the which he has imponed,[59] as I take it, six French rapiers and poignards, with their assigns, as girdle, hangers,[60] or so: Three of the carriages, in faith, are very dear to fancy, very responsive to the hilts, most delicate carriages, and of very liberal conceit.[61]

Ham. What call you the carriages?

Osr. The carriages, sir, are the hangers.

Ham. The phrase would be more german[62] to the matter, if we could carry cannon by our sides.

Osr. The king, sir, hath laid, that in a dozen passes between yourself and him, he shall not exceed you three hits; and it would come to immediate trial, if your lordship would vouchsafe the answer.[63]

Ham. How if I answer no?[64]

Osr. I mean, my lord, the opposition of your person in trial.

Ham. Sir, it is the breathing time of day with me; let the foils be brought, the gentleman willing, and the king hold his purpose, I will win for him if I can; if not, I will gain nothing but my shame and the odd hits.

Osr. Shall I deliver you so?

Ham. To this effect, sir; after what flourish your nature will.

Osr. I commend my duty to your lordship. [_Exit_, L.H.]

Hor. (R.) You will lose this wager, my lord.

Ham. (C.) I do not think so; since he went into France, I have been in continual practice; I shall win at the odds.[65] But thou wouldst not think how ill all's here about my heart: but it is no matter.

Hor. Nay, good my lord.

Ham. It is but foolery; but it is such a kind of gain-giving,[66] as would, perhaps, trouble a woman.

Hor. If your mind dislike any thing, obey it:[67] I will forestall their repair hither, and say, you are not fit.

Ham. Not a whit, we defy augury: there is a special providence in the fall of a sparrow.

[_Exeunt_, L.H.]

SCENE III.--ROOM IN THE CASTLE.

KING _and_ QUEEN, _on a dais_, LAERTES (R.), LORDS (R.), LADIES (L.), OSRIC (R.) _and_ Attendants, _with Foils, &c., discovered_ (R.H.); _Tables_ (R. _and_ L.)-- _Flourish of Trumpets._

Enter HAMLET _and_ HORATIO (L.H.)

King. Come, Hamlet, come, and take this hand from me.

Ham. (_offering his hand to_ LAERTES) Give me your pardon, sir: I have done you wrong; But pardon it, as you are a gentleman. Let my disclaiming from a purpos'd evil Free me so far in your most generous thoughts, That I have shot my arrow o'er the house, And hurt my brother.

Laer. (R.) I am satisfied in nature, Whose motive, in this case, should stir me most To my revenge. I do receive your offer'd love like love, And will not wrong it.

Ham. I embrace it freely: And will this brother's wager frankly play. Give us the foils.

Laer. Come, one for me.

Ham. I'll be your foil, Laertes: in mine ignorance Your skill shall, like a star i'the darkest night, Stick fiery off indeed.[68]

Laer. You mock me, sir.

Ham. No, by this hand.

King. Give them the foils, young Osric. Cousin Hamlet, You know the wager?

Ham. Very well, my lord; Your grace hath laid the odds o'the weaker side.

King. I do not fear it; I have seen you both: But since he's better'd,[69] we have therefore odds.

Laer. This is too heavy, let me see another.

Ham. This likes me well. These foils have all a length?

Osr. Ay, my good lord.

King. Set me the stoups of wine[70] upon that table.--

[Pages _exeunt_ R. _and_ L.]

If Hamlet give the first or second hit, Or quit[71] in answer to the third exchange, Let all the battlements their ordnance fire; The king shall drink to Hamlet's better breath; And in the cup an union shall he throw,[72] Richer than that which four successive kings In Denmark's crown have worn.

[Pages _return with wine._]

Give me the cup; And let the kettle[73] to the trumpet speak, The trumpet to the cannoneer without, The cannons to the heavens, the heaven to earth, _Now the king drinks to Hamlet._--Come, begin; And you, the judges, bear a wary eye.

Ham. Come on, sir.

Laer. Come, my lord.

[_They play._]

Ham. One.

Laer. No.

Ham. Judgment.

Osr. A hit, a very palpable hit.

Laer. Well:--again.

King. Stay; give me drink. Hamlet, this pearl is thine;

[_Drops poison into the goblet._]

Here's to thy health.

[_Pretends to drink._] [_Trumpets sound; and cannon shot off within._]

Give him the cup.

Ham. I'll play this bout first; set it by awhile.

[Page _places the goblet on table_, L.]

Come. Another hit; What say you?

[_They play._]

Laer. A touch, a touch, I do confess.

King. Our son shall win.

Queen. The Queen carouses to thy fortune, Hamlet.[74]

Ham. Good madam!----

[_Trumpets sound._]

King. Gertrude, do not drink.

Queen. I have, my lord; I pray you, pardon me.

King. It is the poison'd cup; it is too late.

[_Aside._]

Laer. I'll hit him now And yet it is almost against my conscience.

[_Aside._]

Ham. Come, for the third, Laertes: You do but dally; I pray you, pass with your best violence; I am afeard you make a wanton of me.[75]

Laer. Say you so? come on.

[_They play._]

[LAERTES _wounds_ HAMLET; _then, in scuffling they change Rapiers, and_ HAMLET _wounds_ LAERTES.]

King. Part them; they are incensed.

Ham. Nay, come, again.

[_The_ QUEEN _falls back in her chair._]

Osr.

(_Supporting_ LAERTES, R.)

Look to the queen there, ho!

Hor.

(_Supporting_ HAMLET, L.)

How is it, my lord?

Osr. How is't, Laertes?

Laer. Why, as a woodcock to my own springe,[76] Osric; I am justly killed with mine own treachery.

Ham. How does the queen?

King. She swoons to see them bleed.

Queen. No, no, the drink, the drink,--O, my dear Hamlet,-- The drink, the drink! I am poison'd.

[_The_ QUEEN _is conveyed off the stage by her attendant_ Ladies, _in a dying state_, L.H.U.E.]

Ham. O villainy! Ho! let the doors be lock'd: Treachery! seek it out.

[LAERTES _falls._]

Laer. (R.) It is here, Hamlet: Hamlet, thou art slain; No medicine in the world can do thee good, In thee there is not half an hour's life; The treacherous instrument is in thy hand, Unbated and envenom'd:[77] the foul practice[78] Hath turn'd itself on me; lo, here I lie, Never to rise again: Thy mother's poison'd: I can no more: the king, the king's to blame.

Ham. The point Envenom'd too! Then, venom, to thy work. Here, thou incestuous, murd'rous, damnèd Dane, Follow my mother.

[_Stabs the_ KING, _who is borne away by his attendants, mortally wounded_, R.H.U.E.]

Laer. He is justly serv'd; Exchange forgiveness with me, noble Hamlet: Mine and my father's death come not upon thee, Nor thine on me!

[_Dies._]

Ham. (C.) Heaven make thee free of it! I follow thee. You that look pale and tremble at this chance, That are but mutes or audience to this act, Had I but time (as this fell sergeant, death,[79] Is strict in his arrest), O, I could tell you,-- But let it be. Horatio, Report me and my cause aright To the unsatisfied.

Hor. (L.) Never believe it: I am more an antique Roman than a Dane: Here's yet some liquor left.

[_Seizing the goblet on table_, L.]

Ham. As thou'rt a man,-- Give me the cup: let go; by heaven, I'll have it.

[_Dashes the goblet away._]

O good Horatio, what a wounded name, Things standing thus unknown, shall live behind me![80] If thou didst ever hold me in thy heart, Absènt thee from felicity awhile, And in this harsh world draw thy breath in pain, To tell my story.-- O, I die, Horatio; The potent poison quite o'er-crows my spirit;[81] The rest is silence.

[_Dies_, C., OSRIC _on his_ R., _and_ HORATIO _on his_ L.]

Dead March afar off.

Curtain slowly descends.

THE END.

Notes

Act V

[Footnote V.1: _Enter two Clowns_,] These characters are not in the original story, but are introduced by Shakespeare.]

[Footnote V.2: _Make her grave straight:_] _i.e._, straightways, forthwith.]

[Footnote V.3: _The crowner_] A corruption of coroner.]

[Footnote V.4: _It must be se offendendo_;] A confusion of things as well as of terms: used for _se defendendo_, a finding of the jury in justifiable homicide.]

[Footnote V.5: _To act, to do, and to perform:_] Warburton says, this is ridicule on scholastic divisions without distinction, and of distinctions without difference.]

[Footnote V.6: _Argal_,] A corruption of the Latin word, _ergo, therefore_.]

[Footnote V.7: _Delver._] _i.e._, a digger, one that opens the ground with a spade.]

[Footnote V.8: _If the man go to this water,--it is, will he, nill he, he goes_,] Still floundering and confounding himself. He means to represent it as a _wilful_ act, and of course without any mixture of _nill_ or nolens in] it. Had he gone, as stated, whether he _would or not_, it would not have been of his own accord, or his act.]

[Footnote V.9: _Crowner's-quest law._] Crowner's-quest is a vulgar corruption of coroner's inquest.]

[Footnote V.10: _Why, there thou say'st_] Say'st something, speak'st to the purpose.]

[Footnote V.11: _More than their even christian._] An old English expression for fellow-christian.]

[Footnote V.12: _Was he a gentleman?_] Mr. Douce says this is intended as a ridicule upon heraldry.]

[Footnote V.13: _Confess thyself----_] Admit, or by acknowledgment pass sentence upon thyself, as a simpleton? "Confess, and be hanged," was a proverbial sentence.]

[Footnote V.14: _Tell me that, and unyoke._] Unravel this, and your day's work is done, your team may then unharness.]

[Footnote V.15: _Cudgel thy brains no more about it_;] _i.e._, beat about thy brains no more.]

[Footnote V.16: _A stoup of liquor._] A stoup is a jug.]

[Footnote V.17: _In youth, when I did love, did love._] The three stanzas sung here by the Grave-Digger, are extracted, with a slight variation, from a little poem called _The Aged Lover renounceth Love_, written by Henry Howard, Earl of Surrey, who was beheaded in 1547. The song is to be found in Dr. Percy's _Reliques of Ancient English Poetry_.]

[Footnote V.18: _The hand of little employment hath the daintier sense._] _i.e._, its "palm less dulled or staled."]

[Footnote V.19: _But to play at loggats with them?_] A _loggat_ is a small _log_, or piece of wood; a diminutive from _log_. Hence _loggats_, as the name of an old game among the common people, and one of those forbidden by a statute of the 33rd of Henry VIII. A stake was fixed into the ground, and those who played threw _loggats_ at it.]

[Footnote V.20: _For and a shrouding sheet:_] For and is an ancient expression, answering to _and eke, and likewise_.]

[Footnote V.21: _Where be his quiddits now, his quillets_,] Quiddits are subtilties; quillets are nice and frivolous distinctions.]

[Footnote V.22: _Knock him about the sconce_] _i.e._, head.]

[Footnote V.23: _How absolute the knave is!_] Peremptory, strictly and tyrannously precise.]

[Footnote V.24: _We must speak by the card_,] The _card_ is the mariner's compass. Properly the paper on which the points of the wind are marked. Hence, _to speak by the card_, meant to speak with great exactness; true to a point.]

[Footnote V.25: _The very day that young Hamlet was born_,] It would appear by this that Hamlet was thirty years old, and knew Yorick well, who had been dead twenty-two years.]

[Footnote V.26: _Favour_] Feature, countenance, or complexion.]

[Footnote V.27: _'Twere to consider too curiously_,] Be pressing the argument with too much critical nicety, to dwell upon mere possibilities.]

[Footnote V.28: _Imperial Cæsar_,] In some edition it is _imperious_ Cæsar. Imperious was a more ancient term, signifying the same as imperial.]

[Footnote V.29: _The winter's flaw!_] _i.e._, winter's blast.]

[Footnote V.30: _Maimèd rites?_] Curtailed, imperfect.]

[Footnote V.31: _Fordo its own life:_] Destroy.]

[Footnote V.32: _'Twas of some estate._] _i.e._, of rank or station.]

[Footnote V.33: _Command o'ersways the order_,] The course which ecclesiastical rules prescribe.]

[Footnote V.34: _Shards_,] _i.e._, broken pots or tiles.]

[Footnote V.35: _Virgin crants_,] _i.e._, virgin garlands. Nares, in his Glossary, says that _crants_ is a German word, and probably Icelandic.]

[Footnote V.36: _Bringing home of bell and burial_,] Conveying to her last home with these accustomed forms of the church, and this sepulture in consecrated ground.]

[Footnote V.37: _A requiem_,] A mass performed in Popish churches for the rest of the soul of a person deceased.]

[Footnote V.38: _Churlish priest_,] Churlish is, figuratively, ill-humoured, ill-bred, uncourtly, "rustic and rude."]

[Footnote V.39: _Ingenious sense_] Life and sense.]

[Footnote V.40: _To o'ertop old Pelion_,] Pelion is one of a lofty range of mountains in Thessaly. The giants, in their war with the gods, are said to have attempted to heap Ossa and Olympus on Pelion, in order to scale Heaven.]

[Footnote V.41: _Outface me_] _i.e._, brave me.]

[Footnote V.42: _Our ground_,] The earth about us.]

[Footnote V.43: _Ossa_] A celebrated mountain in Thessaly, connected with Pelion, and in the neighbourhood of Mount Olympus.]

[Footnote V.44: _Her golden couplets are disclos'd_,] To disclose, was anciently used for to _hatch_. A pigeon never lays more than two eggs.]

[Footnote V.45: _The cat will mew, and dog, &c._] "Things have their appointed course; nor have we power to divert it," may be the sense here conveyed.]

[Footnote V.46: _Strengthen your patience in our last night's speech_;] Let the consideration of the topics then urged, confirm your resolution taken of quietly waiting events a little longer.]

[Footnote V.47: _This grave shall have a living monument:_] There is an ambiguity in this phrase. It either means an _endurable_ monument such as will outlive time, or it darkly hints at the impending fate of Hamlet.]

[Footnote V.48: _Image of my cause_,] Representation or character.]

[Footnote V.49: _Dost know this water-fly?_] Dr. Johnson remarks that a _water-fly_ skips up and down upon the surface of the water, without any apparent purpose or reason, and is thence the proper emblem of a busy trifler.]

[Footnote V.50: _All diligence of spirit._] "With the whole bent of my mind." A happy phraseology; in ridicule, at the same time that it was in conformity with the style of the airy, affected insect that was playing round him.]

[Footnote V.51: _Very sultry and hot_,] Hamlet is here playing over the same farce with Osric which he had formerly done with Polonius. The idea of this scene is evidently suggested by Juvenal.]

[Footnote V.52: _For mine ease, in good faith._] From contemporary authors this appears to have been the ordinary language of courtesy in our author's own time.]

[Footnote V.53: _An absolute--a great showing:_] A finished gentleman, full of various accomplishments, of gentle manners, and very imposing appearance.]

[Footnote V.54: _To speak feelingly of him_,] With insight and intelligence.

[Footnote V.55: _Card or calendar of gentry_,] The card by which a gentleman is to direct his course; the calendar by which he is to choose his time, that what he does may be both excellent and seasonable.]

[Footnote V.56: _The continent of what part a gentleman would see._] The word continent in this sense is frequently used by Shakespeare; _i.e._, you shall find him _containing_ and _comprising_ every quality which a _gentleman_ would desire to _contemplate_ for imitation.]

[Footnote V.57: _What imports the nomination, &c._] What is the object of the introduction of this gentleman's name?]

[Footnote V.58: _I dare not--lest I should compare--were to know himself._] No one can have a perfect conception of the measure of another's excellence, unless he shall himself come up to that standard. Dr. Johnson says, I dare not pretend to know him, lest I should pretend to an equality: no man can completely know another, but by knowing himself, which is the utmost extent of human wisdom.]

[Footnote V.59: _He has imponed_,] _i.e._, to lay down as a stake or wager. Impono.]

[Footnote V.60: _Hangers_,] That part of the girdle or belt by which the swords were suspended was, in our poet's time, called the _hangers_.]

[Footnote V.61: _Very dear to fancy--very liberal conceit._] Of exquisite invention, well adapted to their hilts, and in their conception rich and high fashioned.]

[Footnote V.62: _More german_] More a-kin.]

[Footnote V.63: _Vouchsafe the answer._] Condescend to answer, or meet his wishes.]

[Footnote V.64: _How if I answer, no?_] Reply.]

[Footnote V.65: _I shall win at the odds._] I shall succeed with the advantage that I am allowed.]

[Footnote V.66: _Gain-giving_,] Misgiving.]

[Footnote V.67: _If your mind, &c._] If you have any presentiment of evil, yield to its suggestion.]

[Footnote V.68: _Like a star i'the darkest night, stick fiery off_] Be made by the strongest relief to stand brightly prominent.]

[Footnote V.69: _Better'd_,] He stands higher in estimation.]

[Footnote V.70: _Stoups of wine_] Flagons of wine.]

[Footnote V.71: _Quit in answer_] Make the wager _quit_, or so far drawn.]

[Footnote V.72: _An union shall he throw_,] _i.e._, a fine pearl. To swallow a pearl in a draught seems to have been equally common to royal and mercantile prodigality. It may be observed that pearls were supposed to possess an exhilarating quality. It was generally thrown into the drink as a compliment to some distinguished guest, and the King in this scene, under the pretence of throwing a pearl into the cup, drops some poisonous drug into the wine.]

[Footnote V.73: _Kettle_] _i.e._, kettle drum.]

[Footnote V.74: _The Queen carouses to thy fortune, Hamlet._] _i.e._, drinks to your success.]

[Footnote V.75: _You make a wanton of me._] _i.e._, you trifle with me as if you were playing with a child.]

[Footnote V.76: _As a woodcock to my own springe._] I have run into a springe like a woodcock, and into such a noose or trap as a fool only would have fallen into; one of my own setting.]

[Footnote V.77: _Unbated, and envenom'd:_] _i.e._, having a sharp point envenomed with poison.]

[Footnote V.78: _The foul practice_] _i.e._, the wicked trick which I have practised.]

[Footnote V.79: _Fell sergeant, death_,] _i.e._, cruel sergeant--sergeant being an officer of the law.]

[Footnote V.80: _Live behind me!_] Survive me.]

[Footnote V.81: _Quite o'ercrows my spirit_;] Overpowers, exults over; no doubt an image taken from the lofty carriage of a victorious cock.]

"_There are transitional forms between the metals and non-metals; between chemical combinations and simple mixtures, between animals and plants, between phanerogams and cryptogams, and between mammals and birds.… The improbability may henceforth be taken for granted of finding in Nature a sharp cleavage between all that is masculine on the one side and all that is feminine on the other; or that any living being is so simple in this respect that it can be put wholly on one side, or wholly on the other, of the line._"

O. WEININGER.

Prefatory Note

TO FIRST EDITION

The following papers, now collected in book-form, have been written--and some of them published--on various occasions during the last twelve or fourteen years, and in the intervals of other work; and this must be my excuse for occasional repetitions or overlapping of matter, which may be observable among them. I have thought it best, however, to leave them as they stand, as in this way each is more complete in itself. The second essay, which gives its title to the book, has already appeared in my "Love's Coming-of-Age" (edition 1906), but is reprinted here as belonging more properly to this volume.

A collection of quotations from responsible writers, who touch on various sides of the subject, is added at the end, to form an Appendix--which the author thinks will prove helpful, though he does not necessarily endorse all the opinions presented.

V. THE PLACE OF THE URANIAN IN SOCIETY 107

APPENDIX 131

I

Introductory

The subject dealt with in this book is one of great, and one may say growing, importance. Whether it is that the present period is one of large increase in the numbers of men and women of an intermediate or mixed temperament, or whether it merely is that it is a period in which more than usual attention happens to be accorded to them, the fact certainly remains that the subject has great actuality and is pressing upon us from all sides. It is recognised that anyhow the number of persons occupying an intermediate position between the two sexes is very great, that they play a considerable part in general society, and that they necessarily present and embody many problems which, both for their own sakes and that of society, demand solution. The literature of the question has in consequence already grown to be very extensive, especially on the Continent, and includes a great quantity of scientific works, medical treatises, literary essays, romances, historical novels, poetry, etc. And it is now generally admitted that some knowledge and enlightened understanding of the subject is greatly needed for the use of certain classes--as, for instance, medical men, teachers, parents, magistrates, judges, and the like.

That there are distinctions and gradations of Soul-material in relation to Sex--that the inner psychical affections and affinities shade off and graduate, in a vast number of instances, most subtly from male to female, and not always in obvious correspondence with the outer bodily sex--is a thing evident enough to anyone who considers the subject; nor could any good purpose well be served by ignoring this fact--even if it were possible to do so. It is easy of course (as some do) to classify all these mixed or intermediate types as _bad_. It is also easy (as some do) to argue that just because they combine opposite qualities they are likely to be _good_ and valuable. But the subtleties and complexities of Nature cannot be despatched in this off-hand manner. The great probability is that, as in any other class of human beings, there will be among these too, good and bad, high and low, worthy and unworthy--some perhaps exhibiting through their double temperament a rare and beautiful flower of humanity, others a perverse and tangled ruin.

Before the facts of Nature we have to preserve a certain humility and reverence; nor rush in with our preconceived and obstinate assumptions. Though these gradations of human type have always, and among all peoples, been more or less known and recognised, yet their frequency to-day, or even the concentration of attention on them, may be the indication of some important change actually in progress. We do _not_ know, in fact, what possible evolutions are to come, or what new forms, of permanent place and value, are being already slowly differentiated from the surrounding mass of humanity. It may be that, as at some past period of evolution the worker-bee was without doubt differentiated from the two ordinary bee-sexes, so at the present time certain new types of human kind may be emerging, which will have an important part to play in the societies of the future--even though for the moment their appearance is attended by a good deal of confusion and misapprehension. It may be so; or it may not. We do not know; and the best attitude we can adopt is one of sincere and dispassionate observation of facts.

Of course wherever this subject touches on the domain of love we may expect difficult queries to arise. Yet it is here probably that the noblest work of the intermediate sex or sexes will be accomplished, as well as the greatest errors committed. It seems almost a law of Nature that new and important movements should be misunderstood and vilified--even though afterwards they may be widely approved or admitted to honour. Such movements are always envisaged first from whatever aspect they may possibly present, of ludicrous or contemptible. The early Christians, in the eyes of Romans, were chiefly known as the perpetrators of

obscure rites and crimes in the darkness of the catacombs. Modern Socialism was for a long time supposed to be an affair of daggers and dynamite; and even now there are thousands of good people ignorant enough to believe that it simply means “divide up all round, and each take his threepenny bit.” Vegetarians were supposed to be a feeble and brainless set of cabbage-eaters. The Women’s movement, so vast in its scope and importance, was nothing but an absurd attempt to make women “the apes of men.” And so on without end; the accusation in each case being some tag or last fag-end of fact, caught up by ignorance, and coloured by prejudice. So commonplace is it to misunderstand, so easy to misrepresent.

That the Uranian temperament, especially in regard to its affectional side, is not without faults must naturally be allowed; but that it has been grossly and absurdly misunderstood is certain. With a good deal of experience in the matter, I think one may safely say that the defect of the male Uranian, or Urning,[1] is _not_ sensuality--but rather _sentimentality_. The lower, more ordinary types of Urning are often terribly sentimental; the superior types strangely, almost incredibly emotional; but neither _as a rule_ (though of course there must be exceptions) are so sensual as the average normal man.

This immense capacity of emotional love represents of course a great driving force. Whether in the individual or in society, love is eminently creative. It is their great genius for attachment which gives to the best Uranian types their penetrating influence and activity, and which often makes them beloved and accepted far and wide even by those who know nothing of their inner mind. How many so-called philanthropists of the best kind (we need not mention names) have been inspired by the Uranian temperament, the world will probably never know. And in all walks of life the great number and influence of folk of this disposition, and the distinguished place they already occupy, is only realised by those who are more or less behind the scenes. It is probable also that it is this genius for emotional love which gives to the Uranians their remarkable _youthfulness_.

Anyhow, with their extraordinary gift for, and experience in, affairs of the heart--from the double point of view, both of the man and of the woman--it is not difficult to see that these people have a special work to do as reconcilers and interpreters of the two sexes to each other. Of this I have spoken at more length below (chaps. ii. and v.). It is probable that the superior Urnings will become, in affairs of the heart, to a large extent the teachers of future society; and if so that their influence will tend to the realisation and expression of an attachment less exclusively sensual than the average of to-day, and to the diffusion of this in all directions.

While at any rate not presuming to speak with authority on so difficult a subject, I plead for the necessity of a patient consideration of it, for the due recognition of the types of character concerned, and for some endeavour to give them their fitting place and sphere of usefulness in the general scheme of society.

One thing more by way of introductory explanation. The word Love is commonly used in so general and almost indiscriminate a fashion as to denote sometimes physical instincts and acts, and sometimes the most intimate and profound feelings; and in this way a good deal of misunderstanding is caused. In this book (unless there be exceptions in the Appendix) the word is used to denote the inner devotion of one person to another; and when anything else is meant--as, for instance, sexual relations and actions--this is clearly stated and expressed.

II

The Intermediate Sex.

“Urning men and women, on whose book of life Nature has written her new word which sounds so strange to us, bear such storm and stress within them, such ferment and fluctuation, so much complex material having its outlet only towards the future; their individualities are so rich and many-sided, and withal so little understood, that it is impossible to characterise them adequately in a few sentences.”--_Otto de Joux._

In late years (and since the arrival of the New Woman amongst us) many things in the relation of men and women to each other have altered, or at any rate become clearer. The growing sense of equality in habits and customs--university studies, art, music, politics, the bicycle, etc.--all these things have brought about a _rapprochement_ between the sexes. If the modern woman is a little more masculine in some ways than her predecessor, the modern man (it is to be hoped), while by no means effeminate, is a little more sensitive in temperament and artistic in feeling than the original John Bull. It is beginning to be recognised that the sexes do not or should not normally form two groups hopelessly isolated in habit and feeling from each other, but that they rather represent the two poles of _one_ group--which is the human race; so that while certainly the extreme specimens at either pole are vastly divergent, there are great numbers in the middle region who (though differing corporeally as men and women) are by emotion and temperament very near to each other.[2] We all know women with a strong dash of the masculine temperament, and we all know

men whose almost feminine sensibility and intuition seem to belie their bodily form. Nature, it might appear, in mixing the elements which go to compose each individual, does not always keep her two groups of ingredients--which represent the two sexes--properly apart, but often throws them crosswise in a somewhat baffling manner, now this way and now that; yet wisely, we must think--for if a severe distinction of elements were always maintained the two sexes would soon drift into far latitudes and absolutely cease to understand each other. As it is, there are some remarkable and (we think) indispensable types of character in whom there is such a union or balance of the feminine and masculine qualities that these people become to a great extent the interpreters of men and women to each other.

There is another point which has become clearer of late. For as people are beginning to see that the sexes form in a certain sense a continuous group, so they are beginning to see that Love and Friendship--which have been so often set apart from each other as things distinct--are in reality closely related and shade imperceptibly into each other. Women are beginning to demand that Marriage shall mean Friendship as well as Passion; that a comrade-like Equality shall be included in the word Love; and it is recognised that from the one extreme of a 'Platonic' friendship (generally between persons of the same sex) up to the other extreme of passionate love (generally between persons of opposite sex) no hard and fast line can at any point be drawn effectively separating the different kinds of attachment. We know, in fact, of Friendships so romantic in sentiment that they verge into love; we know of Loves so intellectual and spiritual that they hardly dwell in the sphere of Passion.

A moment's thought will show that the general conceptions indicated above--if anywhere near the truth--point to an immense diversity of human temperament and character in matters relating to sex and love; but though such diversity has probably always existed, it has only in comparatively recent times become a subject of study.

More than thirty years ago, however, an Austrian writer, K. H. Ulrichs, drew attention in a series of pamphlets (_Memnon_, _Ara Spei_, _Inclusa_, etc.) to the existence of a class of people who strongly illustrate the above remarks, and with whom specially this paper is concerned. He pointed out that there were people born in such a position--as it were on the dividing line between the sexes--that while belonging distinctly to one sex as far as their bodies are concerned they may be said to belong _mentally_ and _emotionally_ to the other; that there were men, for instance, who might be described as of feminine soul enclosed in a male body (_anima muliebris in corpore virili inclusa_), or in other cases, women whose definition would be just the reverse. And he maintained that this doubleness of nature was to a great extent proved by the special direction of their love-sentiment. For in such cases, as indeed might be expected, the (apparently) masculine person instead of forming a love-union with a female tended to contract romantic friendships with one of his own sex; while the apparently feminine would, instead of marrying in the usual way, devote herself to the love of another feminine.

People of this kind (_i.e._, having this special variation of the love-sentiment) he called Urnings;[3] and though we are not obliged to accept his theory about the crosswise connexion between 'soul' and 'body,' since at best these words are somewhat vague and indefinite; yet his work was important because it was one of the first attempts, in modern times, to recognise the existence of what might be called an Intermediate sex, and to give at any rate _some_ explanation of it.[4]

Since that time the subject has been widely studied and written about by scientific men and others, especially on the Continent (though in England it is still comparatively unknown), and by means of an extended observation of present-day cases, as well as the indirect testimony of the history and literature of past times, quite a body of general conclusions has been arrived at--of which I propose in the following pages to give some slight account.

Contrary to the general impression, one of the first points that emerges from this study is that 'Urnings,' or Uranians, are by no means so very rare; but that they form, beneath the surface of society, a large class. It remains difficult, however, to get an exact statement of their numbers; and this for more than one reason: partly because, owing to the want of any general understanding of their case, these folk tend to conceal their true feelings from all but their own kind, and indeed often deliberately act in such a manner as to lead the world astray--(whence it arises that a normal man living in a certain society will often refuse to believe that there is a single Urning in the circle of his acquaintance, while one of the latter, or one that understands the nature, living in the same society, can count perhaps a score or more)--and partly because it is indubitable that the numbers do vary very greatly, not only in different countries but even in different classes in the same country. The consequence of all this being that we have estimates differing very widely from each other. Dr. Grabowsky, a well-known writer in Germany, quotes figures (which we think must be exaggerated) as high as one man in every 22, while Dr. Albert Moll (_Die Conträre Sexualempfindung_, chap. 3) gives estimates varying from 1 in every 50 to as low as 1 in every 500.[5] These figures apply to such as are exclusively of the said nature, _i.e._, to those whose deepest feelings of love and friendship go out only to persons of their own sex. Of course, if in

addition are included those double-natured people (of whom there is a great number) who experience the normal attachment, with the homogenic tendency in less or greater degree superadded, the estimates must be greatly higher.

In the second place it emerges (also contrary to the general impression) that men and women of the exclusively Uranian type are by no means necessarily morbid in any way--unless, indeed, their peculiar temperament be pronounced in itself morbid. Formerly it was assumed as a matter of course, that the type was merely a result of disease and degeneration; but now with the examination of the actual facts it appears that, on the contrary, many are fine, healthy specimens of their sex, muscular and well-developed in body, of powerful brain, high standard of conduct, and with nothing abnormal or morbid of any kind observable in their physical structure or constitution. This is of course not true of all, and there still remain a certain number of cases of weakly type to support the neuropathic view. Yet it is very noticeable that this view is much less insisted on by the later writers than by the earlier. It is also worth noticing that it is now acknowledged that even in the most healthy cases the special affectional temperament of the 'Intermediate' is, as a rule, ineradicable; so much so that when (as in not a few instances) such men and women, from social or other considerations, have forced themselves to marry and even have children, they have still not been able to overcome their own bias, or the leaning after all of their life-attachment to some friend of their own sex.

This subject, though obviously one of considerable interest and importance, has been hitherto, as I have pointed out, but little discussed in this country, partly owing to a certain amount of doubt and distrust which has, not unnaturally perhaps, surrounded it. And certainly if the men and women born with the tendency in question were only exceedingly rare, though it would not be fair on that account to ignore them, yet it would hardly be necessary to dwell at great length on their case. But as the class is really, on any computation, numerous, it becomes a duty for society not only to understand them but to help them to understand themselves.

For there is no doubt that in many cases people of this kind suffer a great deal from their own temperament--and yet, after all, it is possible that they may have an important part to play in the evolution of the race. Anyone who realises what Love is, the dedication of the heart, so profound, so absorbing, so mysterious, so imperative, and always just in the noblest natures so strong, cannot fail to see how difficult, how tragic even, must often be the fate of those whose deepest feelings are destined from the earliest days to be a riddle and a stumbling-block, unexplained to themselves, passed over in silence by others.[6] To call people of such temperament 'morbid,' and so forth, is of no use. Such a term is, in fact, absurdly inapplicable to many, who are among the most active, the most amiable and accepted members of society; besides, it forms no solution of the problem in question, and only amounts to marking down for disparagement a fellow-creature who has already considerable difficulties to contend with. Says Dr. Moll, "Anyone who has seen many Urnings will probably admit that they form a by no means enervated human group; on the contrary, one finds powerful, healthy-looking folk among them;" but in the very next sentence he says that they "suffer severely" from the way they are regarded; and in the manifesto of a considerable community of such people in Germany occur these words, "The rays of sunshine in the night of our existence are so rare, that we are responsive and deeply grateful for the least movement, for every single voice that speaks in our favour in the forum of mankind."[7]

In dealing with this class of folk, then, while I do not deny that they present a difficult problem, I think that just for that very reason their case needs discussion. It would be a great mistake to suppose that their attachments are necessarily sexual, or connected with sexual acts. On the contrary (as abundant evidence shows), they are often purely emotional in their character; and to confuse Uranians (as is so often done) with libertines having no law but curiosity in self-indulgence is to do them a great wrong. At the same time, it is evident that their special temperament may sometimes cause them difficulty in regard to their sexual relations. Into this subject we need not just now enter. But we may point out how hard it is, especially for the young among them, that a veil of complete silence should be drawn over the subject, leading to the most painful misunderstandings, and perversions and confusions of mind; and that there should be no hint of guidance; nor any recognition of the solitary and really serious inner struggles they may have to face! If the problem is a difficult one--as it undoubtedly is--the fate of those people is already hard who have to meet it in their own persons, without their suffering in addition from the refusal of society to give them any help. It is partly for these reasons, and to throw a little light where it may be needed, that I have thought it might be advisable in this paper simply to give a few general characteristics of the Intermediate types.

As indicated then already, in bodily structure there is, as a rule, nothing to distinguish the subjects of our discussion from ordinary men and women; but if we take the general mental characteristics it appears from almost universal testimony that the male tends to be of a rather gentle, emotional disposition--with defects, if such exist, in the direction of subtlety, evasiveness, timidity, vanity, etc.; while the female is just the opposite, fiery, active, bold and truthful, with defects running to brusqueness and coarseness. Moreover, the mind of the former is generally intuitive and instinctive in its perceptions, with more or less of artistic feeling; while the mind of the latter is more logical, scientific, and precise than usual with the normal woman. So marked indeed are these general

characteristics that sometimes by means of them (though not an infallible guide) the nature of the boy or girl can be detected in childhood, before full development has taken place; and needless to say it may often be very important to be able to do this.

It was no doubt in consequence of the observation of these signs that K. H. Ulrichs proposed his theory; and though the theory, as we have said, does not by any means meet _all_ the facts, still it is perhaps not without merit, and may be worth bearing in mind.

In the case, for instance, of a woman of this temperament (defined we suppose as “a male soul in a female body”) the theory helps us to understand how it might be possible for her to fall _bonâ fide_ in love with another woman. Krafft-Ebing gives[8] the case of a lady (A.), 28 years of age, who fell deeply in love with a younger one (B.). “I loved her divinely,” she said. They lived together, and the union lasted four years, but was then broken by the marriage of B. A. suffered in consequence from frightful depression; but in the end--though without real love--got married herself. Her depression however only increased and deepened into illness. The doctors, when consulted, said that all would be well if she could only have a child. The husband, who loved his wife sincerely, could not understand her enigmatic behaviour. She was friendly to him, suffered his caresses, but for days afterwards remained “dull, exhausted, plagued with irritation of the spine, and nervous.” Presently a journey of the married pair led to another meeting with the female friend--who had now been wedded (but also unhappily) for three years.

“Both ladies trembled with joy and excitement as they fell into each other’s arms, and were thenceforth inseparable. The man found that this friendship relation was a singular one, and hastened the departure. When the opportunity occurred, he convinced himself from the correspondence between his wife and her ‘friend’ that their letters were exactly like those of two lovers.”

It appears that the loves of such women are often very intense, and (as also in the case of male Urnings) life-long.[9] Both classes feel themselves blessed when they love happily. Nevertheless, to many of them it is a painful fact that--in consequence of their peculiar temperament--they are, though fond of children, not in the position to found a family.

We have so far limited ourselves to some very general characteristics of the Intermediate race. It may help to clear and fix our ideas if we now describe more in detail, first, what may be called the extreme and exaggerated types of the race, and then the more normal and perfect types. By doing so we shall get a more definite and concrete view of our subject.

In the first place, then, the extreme specimens--as in most cases of extremes--are not particularly attractive, sometimes quite the reverse. In the male of this kind we have a distinctly effeminate type, sentimental, lackadaisical, mincing in gait and manners, something of a chatterbox, skilful at the needle and in woman’s work, sometimes taking pleasure in dressing in woman’s clothes; his figure not unfrequently betraying a tendency towards the feminine, large at the hips, supple, not muscular, the face wanting in hair, the voice inclining to be high-pitched, etc.; while his dwelling-room is orderly in the extreme, even natty, and choice of decoration and perfume. His affection, too, is often feminine in character, clinging, dependent and jealous, as of one desiring to be loved almost more than to love.[10]

On the other hand, as the extreme type of the homogenic female, we have a rather markedly aggressive person, of strong passions, masculine manners and movements, practical in the conduct of life, sensuous rather than sentimental in love, often untidy, and _outré_ in attire;[11] her figure muscular, her voice rather low in pitch; her dwelling-room decorated with sporting-scenes, pistols, etc., and not without a suspicion of the fragrant weed in the atmosphere; while her love (generally to rather soft and feminine specimens of her own sex) is often a sort of furor, similar to the ordinary masculine love, and at times almost uncontrollable.

These are types which, on account of their salience, everyone will recognise more or less. Naturally, when they occur they excite a good deal of attention, and it is not an uncommon impression that most persons of the homogenic nature belong to either one or other of these classes. But in reality, of course, these extreme developments are rare, and for the most part the temperament in question is embodied in men and women of quite normal and unsensational exterior. Speaking of this subject and the connection between effeminateness and the homogenic nature in men, Dr. Moll says: “It is, however, as well to point out at the outset that effeminacy does not by any means show itself in all Urnings. Though one may find this or that indication in a great number of cases, yet it cannot be denied that a very large percentage, perhaps by far the majority of them, do _not_ exhibit pronounced Effeminacy.” And it may be supposed that we may draw the same conclusion with regard to women of this class--namely, that the majority of them do not exhibit pronounced masculine habits. In fact, while these extreme cases are of the greatest value from a scientific point of view as marking tendencies and limits of development in certain directions, it would be a serious mistake to look upon them as representative cases of the whole phases of human evolution concerned.

If now we come to what may be called the more normal type of the Uranian man, we find a man who, while possessing thoroughly masculine powers of mind and body, combines with them the tenderer and more emotional soul-nature of the woman--and sometimes to a remarkable degree. Such men, as said, are often muscular and well-built, and not distinguishable in exterior structure and the carriage of body from others of their own sex; but emotionally they are extremely complex, tender, sensitive, pitiful and loving, “full of storm and stress, of ferment and fluctuation” of the heart; the logical faculty may or may not, in their case, be well-developed, but intuition is always strong; like women they read characters at a glance, and know, without knowing how, what is passing in the minds of others; for nursing and waiting on the needs of others they have often a peculiar gift; at the bottom lies the artist-nature, with the artist’s sensibility and perception. Such an one is often a dreamer, of brooding, reserved habits, often a musician, or a man of culture, courted in society, which nevertheless does not understand him--though sometimes a child of the people, without any culture, but almost always with a peculiar inborn refinement. De Joux, who speaks on the whole favourably of Uranian men and women, says of the former: “They are enthusiastic for poetry and music, are often eminently skilful in the fine arts, and are overcome with emotion and sympathy at the least sad occurrence. Their sensitiveness, their endless tenderness for children, their love of flowers, their great pity for beggars and crippled folk are truly womanly.” And in another passage he indicates the artist-nature, when he says: “The nerve-system of many an Urning is the finest and the most complicated musical instrument in the service of the interior personality that can be imagined.”

It would seem probable that the attachment of such an one is of a tender and profound character; indeed, it is possible that in this class of men we have the love sentiment in one of its most perfect forms--a form in which from the necessities of the situation the sensuous element, though present, is exquisitely subordinated to the spiritual. Says one writer on this subject, a Swiss, “Happy indeed is that man who has won a real Urning for his friend--he walks on roses, without ever having to fear the thorns”; and he adds, “Can there ever be a more perfect sick-nurse than an Urning?” And though these are _ex parte_ utterances, we may believe that there is an appreciable grain of truth in them. Another writer, quoted by De Joux, speaks to somewhat the same effect, and may perhaps be received in a similar spirit. “We form,” he says, “a peculiar aristocracy of modest spirits, of good and refined habit, and in many masculine circles are the representatives of the higher mental and artistic element. In us dreamers and enthusiasts lies the continual counterpoise to the sheer masculine portion of society--inclining, as it always does, to mere restless greed of gain and material sensual pleasures.”

That men of this kind despise women, though a not uncommon belief, is one which hardly appears to be justified. Indeed, though naturally not inclined to “fall in love” in this direction, such men are by their nature drawn rather near to women, and it would seem that they often feel a singular appreciation and understanding of the emotional needs and destinies of the other sex, leading in many cases to a genuine though what is called ‘Platonic’ friendship. There is little doubt that they are often instinctively sought after by women, who, without suspecting the real cause, are conscious of a sympathetic chord in the homogenic which they miss in the normal man. To quote De Joux once more: “It would be a mistake to suppose that all Urnings must be woman-haters. Quite the contrary. They are not seldom the faithfulest friends, the truest allies, and most convinced defenders of women.”

To come now to the more normal and perfect specimens of the homogenic _woman_, we find a type in which the body is thoroughly feminine and gracious, with the rondure and fulness of the female form, and the continence and aptness of its movements, but in which the inner nature is to a great extent masculine; a temperament active, brave, originative, somewhat decisive, not too emotional; fond of out-door life, of games and sports, of science, politics, or even business; good at organisation, and well-pleased with positions of responsibility, sometimes indeed making an excellent and generous leader. Such a woman, it is easily seen, from her special combination of qualities, is often fitted for remarkable work, in professional life, or as manageress of institutions, or even as ruler of a country. Her love goes out to younger and more feminine natures than her own; it is a powerful passion, almost of heroic type, and capable of inspiring to great deeds; and when held duly in leash may sometimes become an invaluable force in the teaching and training of girlhood, or in the creation of a school of thought or action among women. Many a Santa Clara, or abbess-founder of religious houses, has probably been a woman of this type; and in all times such women--not being bound to men by the ordinary ties--have been able to work the more freely for the interests of their sex, a cause to which their own temperament impels them to devote themselves _con amore_.

I have now sketched--very briefly and inadequately it is true--both the extreme types and the more healthy types of the ‘Intermediate’ man and woman: types which can be verified from history and literature, though more certainly and satisfactorily perhaps from actual life around us. And unfamiliar though the subject is, it begins to appear that it is one which modern thought and science will have to face. Of the latter and more normal types it may be said that they exist, and have always existed, in considerable abundance, and from that circumstance alone there is a strong probability that they have their place and purpose. As

pointed out there is no particular indication of morbidity about them, unless the special nature of their love-sentiment be itself accounted morbid; and in the alienation of the sexes from each other, of which complaint is so often made to-day, it must be admitted that they do much to fill the gap.

The instinctive artistic nature of the male of this class, his sensitive spirit, his wavelike emotional temperament, combined with hardihood of intellect and body; and the frank, free nature of the female, her masculine independence and strength wedded to thoroughly feminine grace of form and manner; may be said to give them both, through their double nature, command of life in all its phases, and a certain freemasonry of the secrets of the two sexes which may well favour their function as reconcilers and interpreters. Certainly it is remarkable that some of the world's greatest leaders and artists have been dowered either wholly or in part with the Uranian temperament--as in the cases of Michel Angelo, Shakespeare, Marlowe, Alexander the Great, Julius Cæsar, or, among women, Christine of Sweden, Sappho the poetess, and others.

III

The Homogenic Attachment

In its various forms, so far as we know them, Love seems always to have a deep significance and a most practical importance to us little mortals. In one form, as the mere semi-conscious Sex-love, which runs through creation and is common to the lowest animals and plants, it appears as a kind of organic basis for the unity of all creatures; in another, as the love of the mother for her offspring--which may also be termed a passion--it seems to pledge itself to the care and guardianship of the future race; in another, as the marriage of man and woman, it becomes the very foundation of human society. And so we can hardly believe that in its homogenic form, with which we are here concerned, it has not also a deep significance, and social uses and functions which will become clearer to us, the more we study it.

To some perhaps it may appear a little strained to place this last-mentioned form of attachment on a level of importance with the others, and such persons may be inclined to deny to the homogenic[12] or homosexual love that intense, that penetrating, and at times overmastering character which would entitle it to rank as a great human passion. But in truth this view, when entertained, arises from a want of acquaintance with the actual facts; and it may not be amiss here, in the briefest possible way, to indicate what the world's History, Literature, and Art has to say to us on this aspect of the subject, before going on to further considerations. Certainly, if the confronting of danger and the endurance of pain and distress for the sake of the loved one, if sacrifice, unswerving devotion and life-long union, constitute proofs of the reality and intensity (and let us say healthiness) of an affection, then these proofs have been given in numberless cases of such attachment, not only as existing between men, but as between women, since the world began. The records of chivalric love, the feats of enamoured knights for their ladies' sakes, the stories of Hero and Leander, etc., are easily paralleled, if not surpassed, by the stories of the Greek comrades-in-arms and tyrannicides--of Cratinus and Aristodemus, who offered themselves together as a voluntary sacrifice for the purification of Athens; of Chariton and Melanippus,[13] who attempted to assassinate Phalaris, the tyrant of Agrigentum; or of Cleomachus who in like manner, in a battle between the Chalkidians and Eretrians, being entreated to charge the latter, "asked the youth he loved, who was standing by, whether he would be a spectator of the fight; and when he said he would, and affectionately kissed Cleomachus and put his helmet on his head, Cleomachus with a proud joy placed himself in the front of the bravest of the Thessalians and charged the enemy's cavalry with such impetuosity that he threw them into disorder and routed them; and the Eretrian cavalry fleeing in consequence, the Chalkidians won a splendid victory."[14]

The annals of all nations contain similar records--though probably among none has the ideal of this love been quite so enthusiastic and heroic as among the post-Homeric Greeks. It is well known that among the Polynesian Islanders--for the most part a very gentle and affectionate people, probably inheriting the traditions of a higher culture than they now possess--the most romantic male friendships are (or were) in vogue. Says Herman Melville in "Omoo" (chap. 39), "The really curious way in which all Polynesians are in the habit of making bosom friends is deserving of remark.… In the annals of the island (Tahiti) are examples of extravagant friendships, unsurpassed by the story of Damon and Pythias--in truth much more wonderful; for notwithstanding the devotion--even of life in some cases--to which they led, they were frequently entertained at first sight for some stranger from another island." So thoroughly recognised indeed were these unions that Melville explains (in "Typee," chap. 18) that if two men of hostile tribes or islands became thus pledged to each other, then each could pass through the enemy's territory without fear of molestation or injury; and the passionate nature of these attachments is indicated by the following passage from "Omoo" (another book of Melville's):--"Though little inclined to jealousy in ordinary love-matters, the Tahitian will hear of no rivals in his _friendship_."

Even among savage races lower down than these in the scale of evolution, and who are generally accused of being governed in their love-relations only by the most animal desires, we find a genuine sentiment of comradeship beginning to assert itself--as among the Balonda[15] and other African tribes, where regular ceremonies of the betrothal of comrades take place, by the transfusion of a few drops of blood into each other's drinking-bowls, by the exchange of names,[16] and the mutual gift of their most precious possessions; but unfortunately, owing to the obtuseness of current European opinion on this subject, these and other such customs have been but little investigated and have by no means received the attention that they ought.

When we turn to the poetic and literary utterances of the more civilised nations on this subject we cannot but be struck by the range and intensity of the emotions expressed--from the beautiful threnody of David over his friend whose love was passing the love of women, through the vast panorama of the Homeric Iliad, of which the heroic friendship of Achilles and his dear Patroclus forms really the basic theme, down to the works of the great Greek age--the splendid odes of Pindar burning with clear fire of passion, the lofty elegies of Theognis, full of wise precepts to his beloved Kurnus, the sweet pastorals of Theocritus, the passionate lyrics of Sappho, or the more sensual raptures of Anacreon. Some of the dramas of Æschylus and Sophocles--as the "Myrmidones" of the former and the "Lovers of Achilles" of the latter--appear to have had this subject for their motive[17]; and many of the prose-poem dialogues of Plato were certainly inspired by it.

Then coming to the literature of the Roman age, whose materialistic spirit could only with difficulty seize the finer inspiration of the homogenic love, and which in such writers as Catullus and Martial could only for the most part give expression to its grosser side, we still find in Vergil, a noble and notable instance. His second Eclogue bears the marks of a genuine passion; and, according to some,[18] he there under the name of Alexis immortalises his own love for the youthful Alexander. Nor is it possible to pass over in this connection the great mass of Persian literature, and the poets Sadi, Hafiz, Jami, and many others, whose names and works are for all time, and whose marvellous love-songs ("Bitter and sweet is the parting kiss on the lips of a friend") are to a large extent, if not mostly, addressed to those of their own sex.[19]

Of the mediæval period in Europe we have of course but few literary monuments. Towards its close we come upon the interesting story of Amis and Amile (thirteenth century), unearthed by Mr. W. Pater from the Bibliotheca Elzeviriana.[20] Though there is historic evidence of the prevalence of the passion we may say of this period that its _ideal_ was undoubtedly rather the chivalric love than the love of comrades. But with the Renaissance in Italy and the Elizabethan period in England the latter once more comes to evidence in a burst of poetic utterance,[21] which culminates perhaps in the magnificent sonnets of Michel Angelo and of Shakespeare; of Michel Angelo whose pure beauty of expression lifts the enthusiasm into the highest region as the direct perception of the divine in mortal form;[22] and of Shakespeare--whose passionate words and amorous spirituality of friendship have for long enough been a perplexity to hide-bound commentators. Thence through minor writers (not overlooking Winckelmann[23] in Germany) we pass to quite modern times--in which, notwithstanding the fact that the passion has been much misunderstood and misinterpreted, two names stand conspicuously forth--those of Tennyson, whose "In Memoriam" is perhaps his finest work, and of Walt Whitman, the enthusiasm of whose poems on Comradeship is only paralleled by the devotedness of his labors for his wounded brothers in the American Civil War.

It will be noticed that here we have some of the very greatest names in all literature concerned; and that their utterances on this subject equal if they do not surpass, in beauty, intensity and humanity of sentiment, whatever has been written in praise of the other more ordinarily recognised love.

And when again we turn to the records of Art, and compare the way in which man's sense of Love and Beauty has expressed itself in the portrayal of the male form and the female form respectively we find exactly the same thing. The whole vista of Greek statuary shows the male passion of beauty in high degree. Yet though the statues of men and youths (by men sculptors) preponderate probably considerably, both in actual number and in devotedness of execution, over the statues of female figures, it is, as J. A. Symonds says in his "Life of Michel Angelo," remarkable that in all the range of the former there are hardly two or three that show a base or licentious expression, such as is not so very uncommon in the female statues. Knowing as we do the strength of the male physical passion in the life of the Greeks, this one fact speaks strongly for the sense of proportion which must have characterised this passion--at any rate in the most productive age of their Art.

In the case of Michel Angelo we have an artist who with brush and chisel portrayed literally thousands of human forms; but with this peculiarity, that while scores and scores of his male figures are obviously suffused and inspired by a romantic sentiment, there is hardly one of his female figures that is so,--the latter being mostly representative of woman in her part as mother, or sufferer, or prophetess or poetess, or in old age, or in any aspect of strength or tenderness, except that which associates itself especially with

romantic love. Yet the cleanliness and dignity of Michel Angelo's male figures are incontestable, and bear striking witness to that nobility of the sentiment in him, which we have already seen illustrated in his sonnets.[24]

This brief sketch may suffice to give the reader some idea of the place and position in the world of the particular sentiment which we are discussing; nor can it fail to impress him--if any reference is made to the authorities quoted--with a sense of the dignity and solidity of the sentiment, at any rate as handled by some of the world's greatest men. At the same time it would be affectation to ignore the fact that side by side with this view of the subject there has been another current of opinion leading people--especially in quite modern times in Europe--to look upon attachments of the kind in question with much suspicion and disfavour.[25] And it may be necessary here to say a few words on this latter view.

The origin of it is not far to seek. Those who have no great gift themselves for this kind of friendship--who are not in the inner circle of it, so to speak, and do not understand or appreciate its deep emotional and romantic character, have nevertheless heard of certain corruptions and excesses; for these latter leap to publicity. They have heard of the debaucheries of a Nero or a Tiberius; they have noted the scandals of the Police Courts; they have had some experience perhaps of abuses which may be found in Public Schools or Barracks; and they (not unnaturally) infer that these things, these excesses and sensualities, are the motive of comrade-attachments, and the object for which they exist; nor do they easily recognise any more profound and intimate bond. To such people physical intimacies of _any_ kind (at any rate between males) seem inexcusable. There is no distinction in their minds between the simplest or most naive expression of feeling and the gravest abuse of human rights and decency; there is no distinction between a genuine heart-attachment and a mere carnal curiosity. They see certain evils that occur or have occurred, and they think, perfectly candidly, that any measures are justifiable to prevent such things recurring. But they do not see the interior love-feeling which when it exists does legitimately demand _some_ expression. Such folk, in fact, not having the key in themselves to the real situation hastily assume that the homogenic attachment has no other motive than, or is simply a veil and a cover for, sensuality--and suspect or condemn it accordingly.

Thus arises the curious discrepancy of people's views on this important subject--a discrepancy depending on the side from which they approach it.

On the one hand we have anathemas and execrations, on the other we have the lofty enthusiasm of a man like Plato--one of the leaders of the world's thought for all time--who puts, for example, into the mouth of Phædrus (in the "Symposium") such a passage as this[26]: "I know not any greater blessing to a young man beginning life than a virtuous lover, or to the lover than a beloved youth. For the principle which ought to be the guide of men who would nobly live--that principle, I say, neither kindred, nor honour, nor wealth, nor any other motive is able to implant so well as love. Of what am I speaking? Of the sense of honour and dishonour, without which neither states nor individuals ever do any good or great work.… For what lover would not choose rather to be seen of all mankind than by his beloved, either when abandoning his post or throwing away his arms? He would be ready to die a thousand deaths rather than endure this. Or who would desert his beloved or fail him in the hour of danger? The veriest coward would become an inspired hero, equal to the bravest, at such a time; love would inspire him. That courage which, as Homer says, the god breathes into the soul of heroes, love of his own nature inspires into the lover." Or again in the "Phædrus" Plato makes Socrates say[27]: "In like manner the followers of Apollo and of every other god, walking in the ways of their god, seek a love who is to be like their god, and when they have found him, they themselves imitate their god, and persuade their love to do the same, and bring him into harmony with the form and ways of the god as far as they can; for they have no feelings of envy or jealousy towards their beloved, but they do their utmost to create in him the greatest likeness of themselves and the god whom they honour. Thus fair and blissful to the beloved when he is taken, is the desire of the inspired lover, and the initiation of which I speak into the mysteries of true love, if their purpose is effected."

* * * * *

With these few preliminary remarks we may pass on to consider some recent scientific investigations of the matter in hand. In late times--that is, during the last thirty years or so--a group of scientific and capable men chiefly in Germany, France, and Italy, have made a special and more or less impartial study of it. Among these may be mentioned Dr. Albert Moll of Berlin; R. von Krafft-Ebing, one of the leading medical authorities of Vienna, whose book on "Sexual Psychopathy" has passed into its tenth edition; Dr. Paul Moreau ("Des Aberrations du sens génésique"); Cesare Lombroso, the author of various works on Anthropology; M. A. Raffalovich ("Uranisme et unisexualité"); Auguste Forel ("Die Sexuelle Frage"); Mantegazza; K. H. Ulrichs; and last but not least, Dr. Havelock Ellis, of whose great work on the Psychology of Sex the second volume is dedicated to the subject of "Sexual Inversion."[28] The result of these investigations has been that a very altered complexion has been given to the subject. For whereas at first it was

easily assumed that the phenomena were of morbid character, and that the leaning of the love-sentiment towards one of the same sex was always associated with degeneracy or disease, it is very noticeable that step by step with the accumulation of reliable information this assumption has been abandoned. The point of view has changed; and the change has been most marked in the latest authors, such as A. Moll and Havelock Ellis.

It is not possible here to go into anything like a detailed account of the works of these various authors, their theories, and the immense number of interesting cases and observations which they have contributed; but some of the general conclusions which flow from their researches may be pointed out. In the first place their labors have established the fact, known hitherto only to individuals, that _sexual inversion_--that is the leaning of desire to one of the same sex--is in a vast number of cases quite instinctive and congenital, mentally and physically, and therefore twined in the very roots of individual life and practically ineradicable. To Men or Women thus affected with an innate homosexual bias, Ulrichs gave the name of Urning,[29] since pretty widely accepted by scientists. Some details with regard to “Urnings,” I have given in the preceding paper, but it should be said here that too much emphasis cannot be laid on the distinction between these born lovers of their own kind, and that class of persons, with whom they are so often confused, who out of mere carnal curiosity or extravagance of desire, or from the dearth of opportunities for a more normal satisfaction (as in schools, barracks, etc.) adopt some homosexual practices. It is the latter class who become chiefly prominent in the public eye, and who excite, naturally enough, public reprobation. In their case the attraction is felt, by themselves and all concerned, to be merely sensual and morbid. In the case of the others, however, the feeling is, as said, so deeply rooted and twined with the mental and emotional life that the person concerned has difficulty in imagining himself affected otherwise than he is; and to him at least his love appears healthy and natural, and indeed a necessary part of his individuality.

In the second place it has become clear that the number of individuals affected with ‘sexual inversion’ in some degree or other is very great--much greater than is generally supposed to be the case. It is however very difficult or perhaps impossible to arrive at satisfactory figures on the subject,[30] for the simple reasons that the proportions vary so greatly among different peoples and even in different sections of society and in different localities, and because of course there are all possible grades of sexual inversion to deal with, from that in which the instinct is _quite exclusively_ directed towards the same sex, to the other extreme in which it is normally towards the opposite sex but capable, occasionally and under exceptional attractions, of inversion towards its own--this last condition being probably among some peoples very widespread, if not universal.

In the third place, by the tabulation and comparison of a great number of cases and “confessions,” it has become pretty well established that the individuals affected with inversion in marked degree do not after all differ from the rest of mankind, or womankind, in any other physical or mental particular which can be distinctly indicated.[31] No congenital association with any particular physical conformation or malformation has yet been discovered; nor with any distinct disease of body or mind. Nor does it appear that persons of this class are usually of a gross or specially low type, but if anything rather the opposite--being mostly of refined, sensitive nature and including, as Krafft-Ebing points out (“Psychopathia Sexualis,” seventh ed., p. 227) a great number “highly gifted in the fine arts, especially music and poetry”; and, as Mantegazza says,[32] many persons of high literary and social distinction. It is true that Krafft-Ebing insists on the generally strong sexual equipment of this class of persons (among men), but he hastens to say that their emotional love is also “enthusiastic and exalted,”[33] and that, while bodily congress is desired, the special act with which they are vulgarly credited is in most cases repugnant to them.[34]

The only distinct characteristic which the scientific writers claim to have established is a marked tendency to nervous development in the subject, not infrequently associated with nervous maladies; but--as I shall presently have occasion to show--there is reason to think that the validity even of this characteristic has been exaggerated.

Taking the general case of men with a marked exclusive preference for persons of their own sex, Krafft-Ebing says (“P.S.” p. 256): “The sexual life of these Homosexuals is _mutatis mutandis_ just the same as in the case of normal sex-love…. The Urning loves, deifies his male beloved one, exactly as the woman-wooing man does _his_ beloved. For him, he is capable of the greatest sacrifice, experiences the torments of unhappy, often unrequited, love, of faithlessness on his beloved’s part, of jealousy, and so forth. His attention is enchained only by the male form … The sight of feminine charms is indifferent to him, if not repugnant.” Then he goes on to say that many such men, notwithstanding their actual aversion to intercourse with the female, do ultimately marry--either from ethical, as sometimes happens, or from social considerations. But very remarkable--as illustrating the depth and tenacity of the homogenic instinct[35]--and pathetic too, are the records that he gives of these cases; for in many of them a real friendship and regard between the married pair was still of no avail to overcome the distaste on the part of one to sexual intercourse with the other, or to prevent the experience of actual physical distress after such intercourse, or to check the continual flow of

affection to some third person of the same sex; and thus unwillingly, so to speak, this bias remained a cause of suffering to the end.

I have said that at the outset it was assumed that the Homogenic emotion was morbid in itself, and probably always associated with distinct disease, either physical or mental, but that the progress of the inquiry has served more and more to dissipate this view; and that it is noticeable that the latest of the purely scientific authorities are the least disposed to insist upon the theory of morbidity. It is true that Krafft-Ebing clings to the opinion that there is generally some _neurosis_, or degeneration of a nerve-centre, or _inherited tendency in that direction_, associated with the instinct; see p. 190 (seventh ed.), also p. 227, where he speaks, rather vaguely, of "an hereditary neuropathic or psychopathic tendency"--_neuro(psycho)pathische Belastung_. But it is an obvious criticism on this that there are few people in modern life, perhaps none, who could be pronounced absolutely free from such a _Belastung_! And whether the Dorian Greeks or the Polynesian Islanders or the Albanian mountaineers, or any of the other notably hardy races among whom this affection has been developed, were particularly troubled by nervous degeneration we may well doubt!

As to Moll, though he speaks[36] of the instinct as morbid (feeling perhaps in duty bound to do so), it is very noticeable that he abandons the ground of its association with other morbid symptoms--as this association, he says, is by no means always to be observed; and is fain to rest his judgment on the _dictum_ that the mere failure of the sexual instinct to propagate the species is itself pathological--a _dictum_ which in its turn obviously springs from that pre-judgment of scientists that generation is the sole object of love,[37] and which if pressed would involve the good doctor in awkward dilemmas, as for instance that every worker-bee is a pathological specimen.

Finally we find that Havelock Ellis, one of the latest writers of weight on this subject, in chapter vi. of his "Sexual Inversion," combats the idea that this temperament is necessarily morbid; and suggests that the tendency should rather be called an anomaly than a disease. He says (2nd edition, p. 186)[38] "Thus in sexual inversion we have what may fairly be called a 'sport' or variation, one of those organic aberrations which we see throughout living nature in plants and in animals."[39]

With regard to the nerve-degeneration theory, while it may be allowed that sexual inversion is not uncommonly found in connection with the specially nervous temperament, it must be remembered that its occasional association with nervous troubles or disease is quite another matter; since such troubles ought perhaps to be looked upon as the results rather than the causes of the inversion. It is difficult of course for outsiders not personally experienced in the matter to realise the great strain and tension of nerves under which those persons grow up from boyhood to manhood--or from girl to womanhood--who find their deepest and strongest instincts under the ban of the society around them; who before they clearly understand the drift of their own natures discover that they are somehow cut off from the sympathy and understanding of those nearest to them; and who know that they can never give expression to their tenderest yearnings of affection without exposing themselves to the possible charge of actions stigmatised as odious crimes.[40] That such a strain, acting on one who is perhaps already of a nervous temperament, should tend to cause nervous prostration or even mental disturbance is of course obvious; and if such disturbances are really found to be commoner among homogenic lovers than among ordinary folk we have in these social causes probably a sufficient explanation of the fact.

Then again in this connexion it must never be forgotten that the medico-scientific enquirer is bound on the whole to meet with those cases that _are_ of a morbid character, rather than with those that are healthy in their manifestation, since indeed it is the former that he lays himself out for. And since the field of his research is usually a great modern city, there is little wonder if disease colours his conclusions. In the case of Dr. Moll, who carried out his researches largely under the guidance of the Berlin police (whose acquaintance with the subject would naturally be limited to its least satisfactory sides), the only marvel is that his verdict is so markedly favorable as it is. As Krafft-Ebing says in his own preface, "It is the sad privilege of Medicine, and especially of Psychiatry, to look always on the reverse side of life, on the weakness and wretchedness of man."

Having regard then to the direction in which science has been steadily moving in this matter, it is not difficult to see that the epithet "morbid" will probably before long be abandoned as descriptive of the homogenic bias--that is, of the general sentiment of love towards a person of the same sex. That there are excesses of the passion--cases, as in ordinary sex-love, where mere physical desire becomes a mania--we may freely admit; but as it would be unfair to judge of the purity of marriage by the evidence of the Divorce courts, so it would be monstrous to measure the truth and beauty of the attachment in question by those instances which stand most prominently perhaps in the eye of the modern public; and after all deductions there remains, we contend, the vast body of cases in which the manifestation of the instinct has on the whole the character of normality and healthfulness--sufficiently so in fact to constitute this _a distinct variety of the sexual passion_. The question, of course, not being whether the instinct is _capable_ of morbid and extravagant manifestation--for that can easily be proved of any instinct--but whether it is capable of a healthy and sane expression. And this, we think, it has abundantly shown itself to be.

Anyhow the work that Science has practically done has been to destroy the dogmatic attitude of the former current opinion from which itself started, and to leave the whole subject freed from a great deal of misunderstanding, and much more open than before. If on the one hand its results have been chiefly of a negative character, and it admits that it does not understand the exact place and foundation of this attachment; on the other hand since it recognises the deeply beneficial influences of an intimate love-relation of the usual kind on those concerned, it also allows that there are some persons for whom these necessary reactions can only come from one of the same sex as themselves.

“Successful love,” says Moll (p. 125) “exercises a helpful influence on the Urning. His mental and bodily condition improves, and capacity of work increases--just as it happens in the case of a normal youth with _his_ love.” And further on (p. 173) in a letter from a man of this kind occur these words:--“The passion is I suppose so powerful, just because one looks for everything in the loved man--Love, Friendship, Ideal, and Sense-satisfaction.… As it is at present I suffer the agonies of a deep unresponded passion, which wake me like a nightmare from sleep. And I am conscious of physical pain in the region of the heart.” In such cases the love, in some degree physically expressed, of another person of the same sex, is allowed to be as much a necessity and a condition of healthy life and activity, as in more ordinary cases is the love of a person of the opposite sex.

If then the physical element which is sometimes present in the love of which we are speaking is a difficulty and a stumbling-block, it must be allowed that it is a difficulty that Nature confronts us with, and which cannot be disposed of by mere anathema and execration. The only theory--from K. H. Ulrichs to Havelock Ellis--which has at all held its ground in this matter, is that in congenital cases of sex-inversion there is a mixture of male and female elements in the same person; so that for instance in the same embryo the emotional and nervous regions may develop along feminine lines while the outer body and functions may determine themselves as distinctly masculine, or _vice versa_. Such cross-development may take place obviously in a great variety of ways, and thus possibly explain the remarkable varieties of the Uranian temperament; but in all such cases, strange as may be the problems thus arising, these problems are of Nature’s own producing and can hardly be laid to the door of the individual who has literally to bear their cross. For such individuals expressions of feeling become natural, which to others seem out of place and uncalled for; and not only natural, but needful and inevitable. To deny to such people _all_ expression of their emotion, is probably in the end to cause it to burst forth with the greater violence; and it may be suggested that our British code of manners, by forbidding the lighter marks of affection between youths and men, acts just contrary to its own purpose, and drives intimacies down into less open and unexceptionable channels.

With regard to this physical element it must also be remembered that since the homogenic love--whether between man and man, or between woman and woman--can from the nature of the case never find expression on the physical side so freely and completely as is the case with the ordinary love, it must tend rather more than the latter to run along _emotional_ channels, and to find its vent in sympathies of social life and companionship. If one studies carefully the expression of the Greek statues (see p. 9, supra) and the lesson of the Greek literature, one sees clearly that the _ideal_ of Greek life was a very continent one: the trained male, the athlete, the man temperate and restrained, even chaste, for the sake of bettering his powers. It was round this conception that the Greeks kindled their finer emotions. And so of their love: a base and licentious indulgence was not in line with it. They may not have always kept to their ideal, but there it was. And I am inclined to think that the homogenic instinct (for the reasons given above) would in the long run tend to work itself out in this direction. And consonant with this is the fact that this passion in the past (as pointed out by J. Addington Symonds in his paper on “Dantesque and Platonic Ideals of Love”[41]) has, as a matter of fact, inspired such a vast amount of heroism and romance--only paralleled indeed by the loves of Chivalry, which of course, owing to their special character, were subject to a similar Transmutation.

In all these matters the popular opinion has probably been largely influenced by the arbitrary notion that the function of love is limited to child-breeding; and that any love not concerned in the propagation of the race must necessarily be of dubious character. And in enforcing this view, no doubt the Hebraic and Christian tradition has exercised a powerful influence--dating, as it almost certainly does, from far-back times when the multiplication of the tribe was one of the first duties of its members, and one of the first necessities of corporate life.[42] But nowadays when the need has swung round all the other way it is not unreasonable to suppose that a similar revolution will take place in people’s views of the place and purpose of the non-child-bearing love.[43]

* * * * *

I have now said enough I think to show that though much in relation to the homogenic attachment is obscure, and though it may have its special pitfalls and temptations--making it quite necessary to guard against a too great latitude on the physical side; yet on its ethical and social sides it is pregnant with meaning and has received at various times in history abundant justification. It certainly

does not seem impossible to suppose that as the ordinary love has a special function in the propagation of the race, so the other has its special function in social and heroic work, and in the generation--not of bodily children--but of those children of the mind, the philosophical conceptions and ideals which transform our lives and those of society. J. Addington Symonds, in his privately printed pamphlet, “A Problem in Greek Ethics” (now published in a German translation),[44] endeavours to reconstruct as it were the genesis of comrade-love among the Dorians in early Greek times. Thus:--“Without sufficiency of women, without the sanctities of established domestic life, inspired by the memories of Achilles and venerating their ancestor Herakles, the Dorian warriors had special opportunity for elevating comradeship to the rank of an enthusiasm. The incidents of emigration into a foreign country--perils of the sea, passages of rivers and mountains, assaults of fortresses and cities, landings on a hostile shore, night-vigils by the side of blazing beacons, foragings for food, picquet service in the front of watchful foes--involved adventures capable of shedding the lustre of romance on friendship. These circumstances, by bringing the virtues of sympathy with the weak, tenderness for the beautiful, protection for the young, together with corresponding qualities of gratitude, self-devotion, and admiring attachment into play, may have tended to cement unions between man and man no less firm than that of marriage. On such connections a wise captain would have relied for giving strength to his battalions, and for keeping alive the flames of enterprise and daring.” The author then goes on to suggest that though in such relations as those indicated the physical probably had some share, yet it did not at that time overbalance the emotional and spiritual elements, or lead to the corruption and effeminacy of a later age.

At Sparta the lover was called _Eispnêlos_, the inspirer, and the younger beloved _Aïtes_, the hearer. This alone would show the partly educational aspects in which comradeship was conceived; and a hundred passages from classic literature might be quoted to prove how deeply it had entered into the Greek mind that this love was the cradle of social chivalry and heroic life. Finally it seems to have been Plato’s favorite doctrine that the relation if properly conducted led up to the disclosure of true philosophy in the mind, to the divine vision or mania, and to the remembrance or rekindling within the soul of all the forms of celestial beauty. He speaks of this kind of love as causing a “generation in the beautiful”[45] within the souls of the lovers. The image of the beloved one passing into the mind of the lover and upward through its deepest recesses reaches and unites itself to the essential forms of divine beauty there long hidden--the originals as it were of all creation--and stirring them to life excites a kind of generative descent of noble thoughts and impulses, which henceforward modify the whole cast of thought and life of the one so affected.

If there is any truth--even only a grain or two--in these speculations, it is easy to see that the love with which we are specially dealing is a very important factor in society, and that its neglect, or its repression, or its vulgar misapprehension, may be matters of considerable danger or damage to the common-weal. It is easy to see that while on the one hand marriage is of indispensable importance to the State as providing the workshop as it were for the breeding and rearing of children, another form of union is almost equally indispensable to supply the basis for social activities of other kinds. Every one is conscious that without a close affectional tie of some kind his life is not complete, his powers are crippled, and his energies are inadequately spent. Yet it is not to be expected (though it may of course happen) that the man or woman who have dedicated themselves to each other and to family life should leave the care of their children and the work they have to do at home in order to perform social duties of a remote and less obvious, though may be more arduous, character. Nor is it to be expected that a man or woman single-handed, without the counsel of a helpmate in the hour of difficulty, or his or her love in the hour of need, should feel equal to these wider activities. If--to refer once more to classic story--the love of Harmodius had been for a wife and children at home, he would probably not have cared, and it would hardly have been his business, to slay the tyrant. And unless on the other hand each of the friends had had the love of his comrade to support him, the two could hardly have nerved themselves to this audacious and ever-memorable exploit. So it is difficult to believe that anything can supply the force and liberate the energies required for social and mental activities of the most necessary kind so well as a comrade-union which yet leaves the two lovers free from the responsibilities and impedimenta of family life.

For if the slaughter of tyrants is not the chief social duty nowadays, we have with us hydra-headed monsters at least as numerous as the tyrants of old, and more difficult to deal with, and requiring no little courage to encounter. And beyond the extirpation of evils we have solid work waiting to be done in the patient and life-long building up of new forms of society, new orders of thought, and new institutions of human solidarity--all of which in their genesis must meet with opposition, ridicule, hatred, and even violence. Such campaigns as these--though different in kind from those of the Dorian mountaineers described above--will call for equal hardihood and courage, and will stand in need of a comradeship as true and valiant. And it may indeed be doubted whether the higher heroic and spiritual life of a nation is ever quite possible without the sanction of this attachment in its institutions, adding a new range and scope to the possibilities of love.[46]

Walt Whitman, the inaugurator, it may almost be said, of a new world of democratic ideals and literature, and--as one of the best of our critics has remarked--the most Greek in spirit and in performance of modern writers, insists continually on this social function of "intense and loving comradeship, the personal and passionate attachment of man to man." "I will make," he says, "the most splendid race the sun ever shone upon, I will make divine magnetic lands.… I will make inseparable cities with their arms about each others' necks, by the love of comrades." And again, in "Democratic Vistas," "It is to the development, identification, and general prevalence of that fervid comradeship (the adhesive love at least rivaling the amative love hitherto possessing imaginative literature, if not going beyond it), that I look for the counterbalance and offset of materialistic and vulgar American Democracy, and for the spiritualisation thereof.… I say Democracy infers such loving comradeship, as its most inevitable twin or counterpart, without which it will be incomplete, in vain, and incapable of perpetuating itself."

Yet Whitman could not have spoken, as he did, with a kind of authority on this subject, if he had not been fully aware that through the masses of the people this attachment was already alive and working--though doubtless in a somewhat suppressed and un-self-conscious form--and if he had not had ample knowledge of its effects and influence in himself and others around him. Like all great artists he could but give form and light to that which already existed dim and inchoate in the heart of the people. To those who have dived at all below the surface in this direction it will be familiar enough that the homogenic passion ramifies widely through all modern society, and that among the masses of the people as among the classes, even below the stolid surface and reserve of British manners, letters pass and enduring attachments are formed, differing in no very obvious respect from those correspondences which persons of opposite sex knit with each other under similar circumstances; but that hitherto while this relation has occasionally, in its grosser forms and abuses, come into public notice through the police reports, etc., its more sane and spiritual manifestations--though really a moving force in the body politic--have remained unrecognised.

It is hardly needful in these days when social questions loom so large upon us to emphasise the importance of a bond which by the most passionate and lasting compulsion may draw members of the different classes together, and (as it often seems to do) none the less strongly because they are members of different classes. A moment's consideration must convince us that such a comradeship may, as Whitman says, have "deepest relations to general politics." It is noticeable, too, in this deepest relation to politics that the movement among women towards their own liberation and emancipation, which is taking place all over the civilised world, has been accompanied by a marked development of the homogenic passion among the female sex. It may be said that a certain strain in the relations between the opposite sexes which has come about owing to a growing consciousness among women that they have been oppressed and unfairly treated by men, and a growing unwillingness to ally themselves unequally in marriage--that this strain has caused the womenkind to draw more closely together and to cement alliances of their own. But whatever the cause may be it is pretty certain that such comrade-alliances--and of quite devoted kind--are becoming increasingly common, and especially perhaps among the more cultured classes of women, who are working out the great cause of their sex's liberation; nor is it difficult to see the importance of such alliances in such a campaign. In the United States where the battle of women's independence is also being fought, the tendency mentioned is as strongly marked.

A few words may here be said about the legal aspect of this important question. It has to be remarked that the present state of the Law, both in Germany and Britain--arising as it does partly out of some of the misapprehensions above alluded to, and partly out of the sheer unwillingness of legislators to discuss the question--is really impracticable. While the Law rightly seeks to prevent acts of violence or public scandal, it may be argued that it is going beyond its province when it attempts to regulate the private and voluntary relations of adult persons to each other. The homogenic affection is a valuable social force, and in some cases a necessary element of noble human character--yet the Act of 1885 makes almost any familiarity in such cases the possible basis of a criminal charge. The Law has no doubt had substantial ground for previous statutes on this subject--dealing with a certain gross act; but in so severely condemning the least familiarity between male persons[47] we think it has gone too far. It has undertaken a censorship over private morals (entirely apart from social results) which is beyond its province, and which--even if it were its province--it could not possibly fulfil;[48] it has opened wider than ever before the door to a real, most serious social evil and crime--that of blackmailing; and it has thrown a shadow over even the simplest and most ordinary expressions of an attachment which may, as we have seen, be of great value in the national life.

That the homosexual feeling, like the heterosexual, may lead to public abuses of liberty and decency; that it needs a strict self-control; and that much teaching and instruction on the subject is needed; we of course do not deny. But as, in the case of persons of opposite sex, the law limits itself on the whole to a maintenance of public order, the protection of the weak from violence and insult,[49] and of the young from their inexperience; so we think it should be here. The much-needed teaching and the true morality on the subject must be given--as it can only be given--by the spread of proper education and ideas, and not by the clumsy

bludgeon of the statute-book.[50]

Having thus shown the importance of the homogenic or comrade-attachment, in some form, in national life, it would seem high time now that the modern peoples should recognise this in their institutions, and endeavour at least in their public opinion and systems of education to understand this factor and give it its proper place. The undoubted evils which exist in relation to it, for instance in our public schools as well as in our public life, owe their existence largely to the fact that the whole subject is left in the gutter so to speak--in darkness and concealment. No one offers a clue of better things, nor to point a way out of the wilderness; and by this very non-recognition the passion is perverted into its least satisfactory channels. All love, one would say, must have its responsibilities, else it is liable to degenerate, and to dissipate itself in mere sentiment or sensuality. The normal marriage between man and woman leads up to the foundation of the household and the family; the love between parents and children implies duties and cares on both sides. The homogenic attachment left unrecognised, easily loses some of its best quality and becomes an ephemeral or corrupt thing. Yet, as we have seen, and as I am pointing out in the following chapter, it may, when occurring between an elder and younger, prove to be an immense educational force; while, as between equals, it may be turned to social and heroic uses, such as can hardly be demanded or expected from the ordinary marriage. It would seem high time, I say, that public opinion should recognise these facts; and so give to this attachment the sanction and dignity which arise from public recognition, as well as the definite form and outline which would flow from the existence of an accepted ideal or standard in the matter. It is often said how necessary for the morality of the ordinary marriage is some public recognition of the relation, and some accepted standard of conduct in it. May not, to a lesser degree, something of the same kind (as suggested in the next chapter) be true of the homogenic attachment? It has had its place as a recognised and guarded institution in the elder and more primitive societies; and it seems quite probable that a similar place will be accorded to it in the societies of the future.

IV

Affection in Education

The place of Affection, and the need of it, as an educative force in school-life, is a subject which is beginning to attract a good deal of attention. Hitherto Education has been concentred on intellectual (and physical) development; but the affections have been left to take care of themselves. Now it is beginning to be seen that the affections have an immense deal to say in the building up of the brain and the body. Their evolution and organisation in some degree is probably going to become an important part of school management.

School friendships of course exist; and almost every one remembers that they filled a large place in the outlook of his early years; but he remembers, too, that they were not recognised in any way, and that in consequence the main part of their force and value was wasted. Yet it is evident that the first unfolding of a strong attachment in boyhood or girlhood must have a profound influence; while if it occurs between an elder and a younger school-mate, or--as sometimes happens--between the young thing and its teacher, its importance in the educational sense can hardly be overrated.

That such feelings sometimes take quite intense and romantic forms few will deny. I have before me a letter, in which the author, speaking of an attachment he experienced when a boy of sixteen for a youth somewhat older than himself, says:--

“I would have died for him ten times over. My devices and plannings to meet him (to come across him casually, as it were) were those of a lad for his sweetheart, and when I saw him my heart beat so violently that it caught my breath, and I could not speak. We met in----, and for the weeks that he stayed there I thought of nothing else--thought of him night and day--and when he returned to London I used to write him weekly letters, veritable love-letters of many sheets in length. Yet I never felt one particle of jealousy, though our friendship lasted for some years. The passion, violent and extravagant as it was, I believe to have been perfectly free from sex-feeling and perfectly wholesome and good for me. It distinctly contributed to my growth. Looking back upon it and analysing it as well as I can, I seem to see as the chief element in it an escape from the extremely narrow Puritanism in which I was reared, into a large sunny ingenuous nature which knew nothing at all of the bondage of which I was beginning to be acutely conscious.”

Shelley in his fragmentary “Essay on Friendship” speaks in the most glowing terms of an attachment he formed at school, and so does Leigh Hunt in his “Autobiography.” Says the latter:--

“If I had reaped no other benefit from Christ Hospital, the school would be ever dear to me from the recollection of the friendships I formed in it, and of the first heavenly taste it gave me of that most spiritual of the affections.… I shall never forget the impression it

made on me. I loved my friend for his gentleness, his candour, his truth, his good repute, his freedom even from my own livelier manner, his calm and reasonable kindness.… I doubt whether he ever had a conception of a tithe of the regard and respect I entertained for him, and I smile to think of the perplexity (though he never showed it) which he probably felt sometimes at my enthusiastic expressions; for I thought him a kind of angel."

It is not necessary, however, to quote authorities on such a subject as this.[51] Any one who has had experience of schoolboys knows well enough that they are capable of forming these romantic and devoted attachments, and that their alliances are often of the kind especially referred to as having a bearing on education--_i.e._, between an elder and a younger. They are genuine attractions, free as a rule, and at their inception, from secondary motives. They are not formed by the elder one for any personal ends. More often, indeed, I think they are begun by the younger, who naively allows his admiration of the elder one to become visible. But they are absorbing and intense, and on either side their influence is deeply felt and long remembered.

That such attachments _may_ be of the very greatest value is self-evident. The younger boy looks on the other as a hero, loves to be with him, thrills with pleasure at his words of praise or kindness, imitates, and makes him his pattern and standard, learns exercises and games, contracts habits, or picks up information from him. The elder one, touched, becomes protector and helper; the unselfish side of his nature is drawn out, and he develops a real affection and tenderness towards the younger. He takes all sorts of trouble to initiate his _protégé_ in field sports or studies; is proud of the latter's success; and leads him on perhaps later to share his own ideals of life and thought and work.

Sometimes the alliance will begin, in a corresponding way, from the side of the elder boy. Sometimes, as said, between a boy and a master such an attachment, or the germ of it, is found; and indeed it is difficult to say what gulf, or difference of age, or culture, or class in society, is so great that affection of this kind will not on occasion overpass it. I have by me a letter which was written by a boy of eleven or twelve to a young man of twenty-four or twenty-five. The boy was rather a wild, "naughty" boy, and had given his parents (working-class folk) a good deal of trouble. He attended, however, some sort of night-school or evening class and there conceived the strongest affection (evidenced by this letter) for his teacher, the young man in question, quite spontaneously, and without any attempt on the part of the latter to elicit it; and (which was equally important) without any attempt on his part to _deny_ it. The result was most favorable; the one force which could really reach the boy had, as it were, been found; and he developed rapidly and well.

The following extract is from a letter written by an elderly man who has had large experience as a teacher. He says--

"It has always seemed to me that the _rapport_ that exists between two human beings, whether of the same or of different sexes, is a force not sufficiently recognised, and capable of producing great results. Plato fully understood its importance, and aimed at giving what to his countrymen was more or less sensual, a noble and exalted direction.… As one who has had much to do in instructing boys and starting them in life, I am convinced that the great secret of being a good teacher consists in the possibility of that _rapport_; not only of a merely intellectual nature, but involving a certain physical element, a personal affection, almost indescribable, that grows up between pupil and teacher, and through which thoughts are shared and an influence created that could exist in no other way."

And it must be evident to every one that to the expanding mind of a small boy to have a relation of real affection with some sensible and helpful elder of his own sex must be a priceless boon. At that age love to the other sex has hardly declared itself, and indeed is not exactly what is wanted. The unformed mind requires an ideal of itself, as it were, to which it can cling or towards which it can grow. Yet it is equally evident that the relation and the success of it, will depend immensely on the character of the elder one, on the self-restraint and tenderness of which he is capable, and on the ideal of life which he has in his mind. That, possibly, is the reason why Greek custom, at least in the early days of Hellas, not only recognised friendships between elder and younger youths as a national institution of great importance, but laid down very distinct laws or rules concerning the conduct of them, so as to be a guide and a help to the elder in what was acknowledged to be a position of responsibility.

In Crete, for instance,[52] the friendship was entered into in quite a formal and public way, with the understanding and consent of relatives; the position of the elder was clearly defined, and it became his business to train and exercise the younger in skill of arms, the chase, etc.; while the latter could obtain redress at law if the elder subjected him to insult or injury of any kind. At the end of a certain period of probation, if the younger desired it he could leave his comrade; if not, he became his squire or henchman--the elder being bound to furnish his military equipments--and they fought thenceforward side by side in battle, "inspired with double valor, according to the notions of the Cretans, by the gods of war and love."[53] Similar customs prevailed in Sparta, and, in a less

defined way, in other Greek states; as, indeed, they have prevailed among many semi-barbaric races on the threshold of civilisation.

When, however, we turn to modern life and the actual situation, as for instance in the public schools of to-day, it may well be objected that we find very little of the suggested ideal, but rather an appalling descent into the most uninspiring conditions. So far from friendship being an institution whose value is recognised and understood, it is at best scantily acknowledged, and is often actually discountenanced and misunderstood. And though attachments such as we have portrayed exist, they exist underground, as it were, at their peril, and half-stifled in an atmosphere which can only be described as that of the gutter. Somehow the disease of premature sexuality seems to have got possession of our centres of education; wretched practices and habits abound, and (what is perhaps their worst feature) cloud and degrade the boys' conception of what true love or friendship may be.

To those who are familiar with large public schools the state of affairs does not need describing. A friend (who has placed some notes at my disposal) says that in his time a certain well-known public school was a mass of uncleanness, incontinence, and dirty conversation, while at the same time a great deal of genuine affection, even to heroism, was shown among the boys in their relations with one another. But "all these things were treated by masters and boys alike as more or less unholy, with the result that they were either sought after or flung aside according to the sexual or emotional instinct of the boy. No attempt was made at discrimination. A kiss was by comparison as unclean as the act of _fellatio_, and no one had any gauge or principle whatever on which to guide the cravings of boyhood." The writer then goes into details which it is not necessary to reproduce here. He (and others) were initiated in the mysteries of sex by the dormitory servant; and the boys thus corrupted mishandled each other.

Naturally in any such atmosphere as this the chances _against_ the formation of a decent and healthy attachment are very large. If the elder youth happen to be given to sensuality he has here his opportunity; if on the other hand he is _not_ given to it, the ideas current around probably have the effect of making him suspect his own affection, and he ends by smothering and disowning the best part of his nature. In both ways harm is done. The big boys in such places become either coarse and licentious or hard and self-righteous; the small boys, instead of being educated and strengthened by the elder ones, become effeminate little wretches, the favorites, the petted boys, and the "spoons" of the school. As time goes on the public opinion of the school ceases to believe in the possibility of a healthy friendship; the masters begin to presume (and not without reason) that all affection means sensual practices, and end by doing their best to discourage it.

Now this state of affairs is really desperate. There is no need to be puritanical, or to look upon the lapses of boyhood as unpardonable sins; indeed, it may be allowed, as far as that goes, that a little frivolity is better than hardness and self-righteousness; yet every one feels, and must feel, who knows anything about the matter, that the state of our schools is bad.

And it is so because, after all, purity (in the sense of continence) _is_ of the first importance to boyhood. To prolong the period of continence in a boy's life is to prolong the period of _growth_. This is a simple physiological law, and a very obvious one; and whatever other things may be said in favour of purity, it remains perhaps the most weighty. To introduce sensual and sexual habits--and one of the worst of these is self-abuse--at an early age, is to arrest growth, both physical and mental.

And what is even more, it means to arrest the capacity for affection. I believe affection, attachment--whether to the one sex or the other--springs up normally in the youthful mind in a quite diffused, ideal, emotional form--a kind of longing and amazement as at something divine--with no definite thought or distinct consciousness of sex in it. The sentiment expands and fills, as it were like a rising tide, every cranny of the emotional and moral nature; and the longer (of course within reasonable limits) its definite outlet towards sex is deferred, the longer does this period of emotional growth and development continue, and the greater is the refinement and breadth and strength of character resulting. All experience shows that a too early outlet towards sex cheapens and weakens affectional capacity.

Yet this early outlet it is which is the great trouble of our public schools. And it really does not seem unlikely that the peculiar character of the middle-class man of to-day, his undeveloped affectional nature and something of brutishness and woodenness, is largely due to the prevalent condition of the places of his education. The Greeks, with their wonderful instinct of fitness, seem to have perceived the right path in all this matter; and, while encouraging friendship, as we have seen, made a great point of modesty in early life--the guardians and teachers of every well-born boy being especially called upon to watch over the sobriety of his habits and manners.[54]

We have then in education generally, it seems to me (and whether of boys or of girls), two great currents to deal with, which cannot be ignored, and which certainly ought to be candidly recognized and given their right direction. One of these currents is that of

friendship. The other is that of the young thing's natural curiosity about sex. The latter is of course, or should be, a perfectly legitimate interest. A boy at puberty naturally wants to know--and ought to know--what is taking place, and what the uses and functions of his body are. He does not go very deep into things; a small amount of information will probably satisfy him; but the curiosity is there, and it is pretty certain that the boy, if he is a boy of any sense or character, _will_ in some shape or another get to satisfy it.

The process is really a _mental_ one. Desire--except in some abnormal cases--has not manifested itself strongly; and there is often perhaps generally, an actual repugnance at first to anything like sexual practices; but the wish for information exists and is, I say, legitimate enough.[55] In almost all human societies except, curiously, the modern nations, there have been institutions for the initiation of the youth of either sex into these matters, and these initiations have generally been associated, in the opening blossom of the young mind, with inculcation of the ideals of manhood and womanhood, courage, hardihood, and the duties of the citizen or the soldier.[56]

But what does the modern school do? It shuts a trap-door down on the whole matter. There is a hush; a grim silence. Legitimate curiosity soon becomes illegitimate of its kind; and a furtive desire creeps in, where there was no desire before. The method of the gutter prevails. In the absence of any recognition of schoolboy needs, contraband information is smuggled from one to another; chaff and 'smut' take the place of sensible and decent explanations; unhealthy practices follow; the sacredness of sex goes its way, never to return, and the school is filled with premature and morbid talk and thought about a subject which should, by rights, only just be rising over the mental horizon.

The meeting of these two currents, of ideal attachment and sexual desire, constitutes a rather critical period, even when it takes place in the normal way--_i.e._, later on, and at the matrimonial age. Under the most favorable conditions a certain conflict occurs in the mind at their first encounter. But in the modern school this conflict, precipitated far too soon, and accompanied by an artificial suppression of the nobler current and a premature hastening of the baser one, ends in simple disaster to the former. Masters wage war against incontinence, and are right to do so. But how do they wage it? As said, by grim silence and fury, by driving the abscess deeper, by covering the drain over, _and_ by confusing when it comes before them--both in their own minds and those of the boys--a real attachment with that which they condemn.

Not long ago the headmaster of a large public school coming suddenly out of his study chanced upon two boys embracing each other in the corridor. Possibly, and even probably, it was the simple and natural expression of an unsophisticated attachment. Certainly, it was nothing that in itself could be said to be either right or wrong. What did he do? He haled the two boys into his study, gave them a long lecture on the nefariousness of their conduct, with copious hints that he knew _what such things meant_, and _what they led to_, and ended by punishing both condignly. Could anything be more foolish? If their friendship was clean and natural, the master was only trying to make them feel that it was unclean and unnatural, and that a lovely and honorable thing was disgraceful; if the act was--which at least is improbable--a mere signal of lust--even then the best thing would have been to assume that it was honorable, and by talking to the boys, either together or separately, to try and inspire them with a better ideal; while if, between these positions, the master really thought the affection though honorable would lead to things undesirable, then, plainly, to punish the two was only to cement their love for each other, to give them a strong reason for concealing it, and to hasten its onward course. Yet every one knows that this is the _kind_ of way in which the subject is treated in schools. It is the method of despair. And masters (perhaps not unnaturally) finding that they have not the time which would be needed for personal dealing with each boy, nor the forces at their command by which they might hope to introduce new ideals of life and conduct into their little community, and feeling thus utterly unable to cope with the situation, allow themselves to drift into a policy of mere silence with regard to it, tempered by outbreaks of ungoverned and unreasoning severity.

I venture to think that school-masters will never successfully solve the difficulty until they boldly recognize the two needs in question, and proceed candidly to give them their proper satisfaction.

The need of information--the legitimate curiosity--of boys (and girls) must be met, (1) partly by classes on physiology, (2) partly by private talks and confidences between elder and younger, based on friendship. With regard to (1) classes of this kind are already, happily, being carried on at a few advanced schools, and with good results. And though such classes can only go rather generally into the facts of motherhood and generation they cannot fail, if well managed, to impress the young minds, and give them a far grander and more reverent conception of the matter than they usually gain.

But (2) although some rudimentary teaching on sex and lessons in physiology may be given in classes, it is obvious that further instruction and indeed any real help in the conduct of life and morals can only come through very close and tender confidences between the elder and the younger, such as exist where there is a strong friendship to begin with. It is obvious that effective help _can_ only come in this way, and that this is the only way in which it is desirable that it should come. The elder friend in this case would, one might say, naturally be, and in many instances may be, the parent, mother or father--who ought certainly to be able to impress on the clinging child the sacredness of the relation. And it is much to be hoped that parents will see their way to take this part more freely in the future. But for some unexplained reason there is certainly often a gulf of reserve between the (British) parent and child; and the boy who is much at school comes more under the influence of his elder companions than his parents. If, therefore, boys and youths cannot be trusted and encouraged to form decent and loving friendships with each other, and with their elders or juniors--in which many delicate questions could be discussed and the tradition of sensible and manly conduct with regard to sex handed down--we are indeed in a bad plight and involved in a vicious circle from which escape seems difficult.

And so (we think) the need of attachment must also be met by full recognition of it, and the granting of it expression within all reasonable limits; by the dissemination of a good ideal of friendship and the enlistment of it on the side of manliness and temperance. Is it too much to hope that schools will in time recognise comradeship as a regular institution--considerably more important, say, than “fagging”--an institution having its definite place in the school life, in the games and in the studies, with its own duties, responsibilities, privileges, etc., and serving to ramify through the little community, hold it together, and inspire its members with the two qualities of heroism and tenderness, which together form the basis of all great character?

But here it must be said that if we are hoping for any great change in the conduct of our large boys’ schools, the so-called public schools are not the places in which to look for it--or at any rate for its inception. In the first place these institutions are hampered by powerful traditions which naturally make them conservative; and in the second place their mere size and the number of boys make them difficult to deal with or to modify. The masters are overwhelmed with work; and the (necessary) division of so many boys into separate ‘houses’ has this effect that a master who introduces a better tradition into his own house has always the prospect before him that his work will be effaced by the continual and perhaps contaminating contact with the boys from the other houses. No, it will be in smaller schools, say of from 50 to 100 boys, where the personal influence of the headmaster will be a real force reaching each boy, and where he will be really able to mould the tradition of the school, that we shall alone be able to look for an improved state of affairs.[57]

No doubt the first steps in any reform of this kind are difficult; but masters are greatly hampered by the confusion in the public mind, to which we have already alluded--which so often persists in setting down any attachment between two boys, or between a boy and his teacher, to nothing but sensuality. Many masters quite understand the situation, but feel themselves helpless in the face of public opinion. Who so fit (they sometimes feel) to enlighten a young boy and guide his growing mind as one of themselves, when the bond of attachment exists between the two? Like the writer of a letter quoted in the early part of this paper they believe that “a personal affection, almost indescribable, grows up between pupil and teacher, through which thoughts are shared and an influence created that could exist in no other way.” Yet when the pupil comes along of whom all this might be true, who shows by his pleading looks the sentiment which animates him, and the profound impression which he is longing, as it were, to receive from his teacher, the latter belies himself, denies his own instinct and the boy’s great need, and treats him distantly and with coldness. And why? Simply because he dreads, even while he desires it, the boy’s confidence. He fears the ingenuous and perfectly natural expression of the boy’s affection in caress or embrace, because he knows how a bastard public opinion will interpret, or misinterpret it; and rather than run such a risk as this he seals the fountains of the heart, withholds the help which love alone can give, and deliberately nips the tender bud which is turning to him for light and warmth.[58]

The panic terror which prevails in England with regard to the expression of affection of this kind has its comic aspect. The affection exists, and is known to exist, on all sides; but we must bury our heads in the sand and pretend not to see it. And if by any chance we are compelled to recognize it, we must show our vast discernment by _suspecting_ it. And thus we fling on the dust-heap one of the noblest and most precious elements in human nature. Certainly, if the denial and suspicion of all natural affection were beneficial, we should find this out in our schools; but seeing how complete is its failure there to clarify their tone it is sufficiently evident that the method itself is wrong.

* * * * *

The remarks in this paper have chiefly had reference to boys’ schools; but they apply in the main to girls’ schools, where much the same troubles prevail--with this difference, that in girls’ schools friendships instead of being repressed are rather encouraged by

public opinion; only unfortunately they are for the most part friendships of a weak and sentimental turn, and not very healthy either in themselves or in the habits they lead to. Here too, in girls' schools, the whole subject wants facing out; friendship wants setting on a more solid and less sentimental basis; and on the subject of sex, so infinitely important to women, there needs to be sensible and consistent teaching, both public and private. Possibly the co-education of boys and girls may be of use in making boys less ashamed of their feelings, and girls more healthy in the expression of them.

At any rate the more the matter is thought of, the clearer I believe will it appear that a healthy affection must in the end be the basis of education, and that the recognition of this will form the only way out of the modern school-difficulty. It is true that such a change would revolutionise our school-life; but it will have to come, all the same, and no doubt will come _pari passu_ with other changes that are taking place in society at large.

V

The Place of the Uranian in Society

Whatever differing views there may be on the many problems which the Intermediate sexes present--and however difficult of solution some of the questions involved--there is one thing which appears to me incontestable: namely that a vast number of intermediates do actually perform most valuable social work, and that they do so partly on account and by reason of their special temperament.

This fact is not generally recognised as it ought to be, for the simple reason that the Uranian himself is not recognised, and indeed (as we have already said) tends to conceal his temperament from the public. There is no doubt that if it became widely known _who are_ the Uranians, the world would be astonished to find so many of its great or leading men among them.

I have thought it might be useful to indicate some of the lines along which valuable work is being performed, or has been performed, by people of this disposition; and in doing this I do not of course mean to disguise or conceal the fact that there are numbers of merely frivolous, or feeble or even vicious homosexuals, who practically do no useful work for society at all--_just as there are of normal people_. The existence of those who do no valuable work does not alter the fact of the existence of others whose work is of great importance. And I wish also to make it clearly understood that I use the word Uranians to indicate simply those whose lives and activities are inspired by a genuine friendship or love for their own sex, without venturing to specify their individual and particular habits or relations towards those whom they love (which relations in most cases we have no means of knowing). Some Intermediates of light and leading--doubtless not a few--are physically very reserved and continent; others are sensual in some degree or other. The point is that they are all men, or women, whose most powerful motive comes from the dedication to their own kind, and is bound up with it in some way. And if it seems strange and anomalous that in such cases work of considerable importance to society is being done by people whose affections and dispositions society itself would blame, this is after all no more than has happened a thousand times before in the history of the world.

As I have already hinted, the Uranian temperament (probably from the very fact of its dual nature and the swift and constant interaction between its masculine and feminine elements) is exceedingly sensitive and emotional; and there is no doubt that, going with this, a large number of the artist class, musical, literary or pictorial, belong to this description. That delicate and subtle sympathy with every wave and phase of feeling which makes the artist possible is also very characteristic of the Uranian (the male type), and makes it easy or natural for the Uranian man to become an artist. In the 'confessions' and 'cases' collected by Krafft-Ebing, Havelock Ellis and others, it is remarkable what a large percentage of men of this temperament belong to the artist class. In his volume on "Sexual Inversion,"[59] speaking of the cases collected by himself, Ellis says:--"An examination of my cases reveals the interesting fact that thirty-two of them, or sixty-eight per cent., possess artistic aptitude in varying degree. Galton found, from the investigation of nearly one thousand persons, that the general average showing artistic taste in England is only about thirty per cent. It must also be said that my figures are probably below the truth, as no special point was made of investigating the matter, and also that in many of my cases the artistic aptitudes are of high order. With regard to the special avocations of my cases, it must of course be said that no occupation furnishes a safeguard against inversion. There are, however, certain occupations to which inverts are specially attracted. Acting is certainly one of the chief of these. Three of my cases belong to the dramatic profession, and others have marked dramatic ability. Art, again, in its various forms, and music, exercise much attraction. In my experience, however, literature is the avocation to which inverts seem to feel chiefly called, and that moreover in which they may find the highest degree of success and reputation. At least half-a-dozen of my cases are successful men of letters."

Of Literature in this connection, and of the great writers of the world whose work has been partly inspired by the Uranian love, I have myself already spoken.[60] It may further be said that those of the modern artist-writers and poets who have done the greatest service in the way of interpreting and reconstructing _Greek_ life and ideals--men like Winckelmann, Goethe, Addington Symonds, Walter Pater--have had a marked strain of this temperament in them. And this has been a service of great value, and one which the world could ill have afforded to lose.

The painters and sculptors, especially of the renaissance period in Italy, yield not a few examples of men whose work has been similarly inspired--as in the cases of Michel Angelo, Lionardo, Bazzi, Cellini, and others. As to music, this is certainly the art which in its subtlety and tenderness--and perhaps in a certain inclination to _indulge_ in emotion--lies nearest to the Urning nature. There are few in fact of this nature who have not some gift in the direction of music--though, unless we cite Tschaikowsky, it does not appear that any thorough-going Uranian has attained to the highest eminence in this art.

Another direction along which the temperament very naturally finds an outlet is the important social work of Education. The capacity that a man has, in cases, of devoting himself to the welfare of boys or youths, is clearly a thing which ought not to go wasted--and which may be most precious and valuable. It is incontestable that a great number of men (and women) are drawn into the teaching profession by this sentiment--and the work they do is, in many cases, beyond estimation. Fortunate the boy who meets with such a helper in early life! I know a man--a rising and vigorous thinker and writer--who tells me that he owes almost everything mentally to such a friend of his boyhood, who took the greatest interest in him, saw him almost every day for many years, and indeed cleared up for him not only things mental but things moral, giving him the affection and guidance his young heart needed. And I have myself known and watched not a few such teachers, in public schools and in private schools, and seen something of the work and of the real inspiration they have been to boys under them. Hampered as they have been by the readiness of the world to misinterpret, they still have been able to do most precious service. Of course here and there a case occurs in which privilege is abused; but even then the judgment of the world is often unreasonably severe. A poor boy once told me with tears in his eyes of the work a man had done for him. This man had saved the boy from drunken parents, taken him from the slums, and by means of a club helped him out into the world. Many other boys he had rescued, it appeared, in the same way--scores and scores of them. But on some occasion or other he got into trouble, and was accused of improper familiarities. No excuse, or record of a useful life, was of the least avail. Every trumpery slander was believed, every mean motive imputed, and he had to throw up his position and settle elsewhere, his life-work shattered, never to be resumed.

The capacity for sincere affection which causes an elder man to care so deeply for the welfare of a youth or boy, is met and responded to by a similar capacity in the young thing of devotion to an elder man. This fact is not always recognised; but I have known cases of boys and even young men who would feel the most romantic attachments to quite mature men, sometimes as much as forty or fifty years of age, and only for them--passing by their own contemporaries of either sex, and caring only to win a return affection from these others. This may seem strange, but it is true. And the fact not only makes one understand what riddles there are slumbering in the breasts of our children, but how greatly important it is that we should try to read them--since here, in such cases as these, the finding of an answering heart in an elder man would probably be the younger one’s salvation.

How much of the enormous amount of philanthropic work done in the present day--by women among needy or destitute girls of all sorts, or by men among like classes of boys--is inspired by the same feeling, it would be hard to say; but it must be a very considerable proportion. I think myself that the best philanthropic work--just because it is the most personal, the most loving, and the least merely formal and self-righteous--has a strong fibre of the Uranian heart running through it; and if it should be said that work of this very personal kind is more liable to dangers and difficulties on that account, it is only what is true of the best in almost all departments.

Eros is a great leveler. Perhaps the true Democracy rests, more firmly than anywhere else, on a sentiment which easily passes the bounds of class and caste, and unites in the closest affection the most estranged ranks of society. It is noticeable how often Uranians of good position and breeding are drawn to rougher types, as of manual workers, and frequently very permanent alliances grow up in this way, which although not publicly acknowledged have a decided influence on social institutions, customs and political tendencies--and which would have a good deal more influence could they be given a little more scope and recognition. There are cases that I have known (although the ordinary commercial world might hardly believe it) of employers who have managed to attach their workmen, or many of them, very personally to themselves, and whose object in running their businesses was at least as much to provide their employees with a living as themselves; while the latter, feeling this, have responded with their best output. It is possible that something like the guilds and fraternities of the middle ages might thus be reconstructed, but on a more intimate and personal basis than in those days; and indeed there are not wanting signs that such a reconstruction is actually taking place.

The “Letters of Love and Labour” written by Samuel M. Jones of Toledo, Ohio, to his workmen in the engineering firm of which he was master, are very interesting in this connection. They breathe a spirit of extraordinary personal affection towards, and confidence in, the employees, which was heartily responded to by the latter; and the whole business was carried on, with considerable success, on the principle of a close and friendly co-operation all round.[61]

These things indeed suggest to one that it is possible that the Uranian spirit may lead to something like a general enthusiasm of Humanity, and that the Uranian people may be destined to form the advance guard of that great movement which will one day transform the common life by substituting the bond of personal affection and compassion for the monetary, legal and other external ties which now control and confine society. Such a part of course we cannot expect the Uranians to play unless the capacity for their kind of attachment also exists--though in a germinal and undeveloped state--in the breast of mankind at large. And modern thought and investigation are clearly tending that way--to confirm that it does so exist.

Dr. E. Bertz in his late study of Whitman as a person of strongly homogenic temperament[62] brings forward the objection that Whitman’s gospel of Comradeship as a means of social regeneration is founded on a false basis--because (so Dr. Bertz says) the gospel derives from an abnormality in himself, and therefore cannot possibly have a universal application or create a general enthusiasm. But this is rather a case of assuming the point which has to be proved. Whitman constantly maintains that his own disposition at any rate is normal, and that he represents the average man. And it _may_ be true, even as far as his Uranian temperament is concerned, that while this was specially developed in him the germs of it _are_ almost, if not quite, universal. If so, then the Comradeship on which Whitman founds a large portion of his message may in course of time become a general enthusiasm, and the nobler Uranians of to-day may be destined, as suggested, to be its pioneers and advance guard. As one of them himself has sung:--

These things shall be! A loftier race, Than e’er the world hath known, shall rise With flame of freedom in their souls, And light of science in their eyes. Nation with nation, land with land, In-armed shall live as comrades free; In every heart and brain shall throb The pulse of one fraternity.[63]

To proceed. The Uranian, though generally high-strung and sensitive, is by no means always dreamy. He is sometimes extraordinarily and unexpectedly practical; and such a man may, and often does, command a positive enthusiasm among his subordinates in a business organisation. The same is true of military organisation. As a rule the Uranian temperament (in the male) is not militant. War with its horrors and savagery is somewhat alien to the type. But here again there are exceptions; and in all times there have been great generals (like Alexander, Cæsar, Charles XII. of Sweden, or Frederick II. of Prussia--not to speak of more modern examples) with a powerful strain in them of the homogenic nature, and a wonderful capacity for organisation and command, which combined with their personal interest in, or attachment to, their troops, and the answering enthusiasm so elicited, have made their armies well-nigh invincible.

The existence of this great practical ability in some Uranians cannot be denied; and it points to the important work they may some day have to do in social reconstruction. At the same time I think it is noticeable that _politics_ (at any rate in the modern sense of the word, as concerned mainly with party questions and party government) is not as a rule congenial to them. The personal and affectional element is perhaps too remote or absent. Mere ‘views’ and ‘questions’ and party strife are alien to the Uranian man, as they are on the whole to the ordinary woman.

If politics, however, are not particularly congenial, it is yet remarkable how many royal personages have been decidedly homogenic in temperament. Taking the Kings of England from the Norman Conquest to the present day, we may count about thirty. And three of these, namely, William Rufus, Edward II., and James I. were homosexual in a marked degree--might fairly be classed as Urnings--while some others, like William III., had a strong admixture of the same temperament. Three out of thirty yields a high ratio--ten per cent--and considering that sovereigns do not generally choose themselves, but come into their position by accident of birth, the ratio is certainly remarkable. Does it suggest that the general percentage in the world at large is equally high, but that it remains unnoticed, except in the fierce light that beats upon thrones? or is there some other explanation with regard to the special liability of royalty to inversion? Hereditary degeneracy has sometimes been suggested. But it is difficult to explain the matter even on this theory; for though the epithet ‘degenerate’ might possibly apply to James I., it would certainly not be applicable to William Rufus and William III., who, in their different ways, were both men of great courage and personal force--while Edward II. was by no means wanting in ability.

But while the Uranian temperament has, in cases, specially fitted its possessors to become distinguished in art or education or war or administration, and enabled them to do valuable work in these fields; it remains perhaps true that above all it has fitted them, and fits them, for distinction and service in affairs of the heart.

It is hard to imagine human beings more skilled in these matters than are the Intermediates. For indeed no one else can possibly respond to and understand, as they do, all the fluctuations and interactions of the masculine and feminine in human life. The pretensive coyness and passivity of women, the rude invasiveness of men; lust, brutality, secret tears, the bleeding heart; renunciation, motherhood, finesse, romance, angelic devotion--all these things lie slumbering in the Uranian soul, ready on occasion for expression; and if they are not always expressed are always there for purposes of divination or interpretation. There are few situations, in fact, in courtship or marriage which the Uranian does not instinctively understand; and it is strange to see how even an unlettered person of this type will often read Love's manuscript easily in cases where the normal man or woman is groping over it like a child in the dark. [Not of course that this means to imply any superiority of _character_ in the former; but merely that with his double outlook he necessarily discerns things which the other misses.]

That the Uranians do stand out as helpers and guides, not only in matters of Education, but in affairs of love and marriage, is tolerably patent to all who know them. It is a common experience for them to be consulted now by the man, now by the woman, whose matrimonial conditions are uncongenial or disastrous--not generally because the consultants in the least perceive the Uranian nature, but because they instinctively feel that here is a strong sympathy with and understanding of their side of the question. In this way it is often the fate of the Uranian, himself unrecognised, to bring about happier times and a better comprehension of each other among those with whom he may have to deal. Also he often becomes the confidant of young things of either sex, who are caught in the tangles of love or passion, and know not where to turn for assistance.

I say that I think perhaps of all the services the Uranian may render to society it will be found some day that in this direction of solving the problems of affection and of the heart he will do the greatest service. If the day is coming as we have suggested--when Love is at last to take its rightful place as the binding and directing force of society (instead of the Cash-nexus), and society is to be transmuted in consequence to a higher form, then undoubtedly the superior types of Uranians--prepared for this service by long experience and devotion, as well as by much suffering--will have an important part to play in the transformation. For that the Urnings in their own lives put Love before everything else--postponing to it the other motives like money-making, business success, fame, which occupy so much space in most people's careers--is a fact which is patent to everyone who knows them. This may be saying little or nothing in favor of those of this class whose conception of love is only of a poor and frivolous sort; but in the case of those others who see the god in his true light, the fact that they serve him in singleness of heart and so unremittingly raises them at once into the position of the natural leaders of mankind.

From this fact--_i.e._, that these folk think so much of affairs of the heart--and from the fact that their alliances and friendships are formed and carried on beneath the surface of society, as it were, and therefore to some extent beyond the inquisitions and supervisions of Mrs. Grundy, some interesting conclusions flow.

For one thing, the question is constantly arising as to how Society would shape itself if _free_: what form, in matters of Love and Marriage, it would take, if the present restrictions and sanctions were removed or greatly altered. At present in these matters, the Law, the Church, and a strong pressure of public opinion interfere, compelling the observance of certain forms; and it becomes difficult to say how much of the existing order is due to the spontaneous instinct and common sense of human nature, and how much to mere outside compulsion and interference: how far, for instance, Monogamy is natural or artificial; to what degree marriages would be permanent if the Law did not make them so; what is the rational view of Divorce; whether jealousy is a necessary accompaniment of Love; and so forth. These are questions which are being constantly discussed, without finality; or not infrequently with quite pessimistic conclusions.

Now in the Urning societies a certain freedom (though not complete, of course) exists. Underneath the surface of general Society, and consequently unaffected to any great degree by its laws and customs, alliances are formed and maintained, or modified or broken, more in accord with inner need than with outer pressure. Thus it happens that in these societies there are such opportunities to note and observe human grouping under conditions of freedom, as do not occur in the ordinary world. And the results are both interesting and encouraging. As a rule I think it may be said that the alliances are remarkably permanent. Instead of the wild "general post" which so many good people seem to expect in the event of law being relaxed, one finds (except of course in a few individual cases) that common sense and fidelity and a strong tendency to permanence prevail. In the ordinary world so far has doubt gone that many to-day disbelieve in a life-long free marriage. Yet among the Uranians such a thing is, one may almost

say, common and well known; and there are certainly few among them who do not believe in its possibility.

Great have been the debates, in all times and places, concerning Jealousy; and as to how far jealousy is natural and instinctive and universal, and how far it is the product of social opinion and the property sense, and so on. In ordinary marriage what may be called social and proprietary jealousy is undoubtedly a very great factor. But this kind of jealousy hardly appears or operates in the Urning societies. Thus we have an opportunity in these latter of observing conditions where only the natural and instinctive jealousy exists. This of course is present among the Urnings--sometimes rampant and violent, sometimes quiescent and vanishing almost to _nil_. It seems to depend almost entirely upon the individual; and we certainly learn that jealousy though frequent and widespread, is not an absolutely necessary accompaniment of love. There are cases of Uranians (whether men or women) who, though permanently allied, do not object to lesser friendships on either side--and there are cases of very decided objection. And we may conclude that something the same would be true (is true) of the ordinary Marriage, the property considerations and the property jealousy being once removed. The tendency anyhow to establish a dual relation more or less fixed, is seen to be very strong among the Intermediates, and may be concluded to be equally strong among the more normal folk.

Again with regard to Prostitution. That there are a few natural-born prostitutes is seen in the Urning-societies; but prostitution in that world does not take the important place which it does in the normal world, partly because the law-bound compulsory marriage does not exist there, and partly because prostitution naturally has little chance and cannot compete in a world where alliances are free and there is an open field for friendship. Hence we may see that freedom of alliance and of marriage in the ordinary world will probably lead to the great diminution or even disappearance of Prostitution.

In these and other ways the experience of the Uranian world forming itself freely and not subject to outside laws and institutions comes as a guide--and really a hopeful guide--towards the future. I would say however that in making these remarks about certain conclusions which we are able to gather from some spontaneous and comparatively unrestricted associations, I do not at all mean to argue _against_ institutions and forms. I think that the Uranian love undoubtedly suffers from want of a recognition and a standard. And though it may at present be better off than if subject to a foolish and meddlesome regulation; yet in the future it will have its more or less fixed standards and ideals, like the normal love. If one considers for a moment how the ordinary relations of the sexes would suffer were there no generally acknowledged codes of honor and conduct with regard to them, one then indeed sees that reasonable forms and institutions are a help, and one may almost wonder that the Urning circles are so well-conducted on the whole as they are.

I have said that the Urning men in their own lives put love before money-making, business success, fame, and other motives which rule the normal man. I am sure that it is also true of them as a whole that they put love before lust. I do not feel _sure_ that this can be said of the normal man, at any rate in the present stage of evolution. It is doubtful whether on the whole the merely physical attraction is not the stronger motive with the latter type. Unwilling as the world at large is to credit what I am about to say, and great as are the current misunderstandings on the subject, I believe it is true that the Uranian men are superior to the normal men in this respect--in respect of their love-feeling--which is gentler, more sympathetic, more considerate, more a matter of the heart and less one of mere physical satisfaction than that of ordinary men.[64] All this flows naturally from the presence of the feminine element in them, and its blending with the rest of their nature. It should be expected _a priori_, and it can be noticed at once by those who have any acquaintance with the Urning world. Much of the current misunderstanding with regard to the character and habits of the Urning arises from his confusion with the ordinary _roué_ who, though of normal temperament, contracts homosexual habits out of curiosity and so forth--but this is a point which I have touched on before, and which ought now to be sufficiently clear. If it be once allowed that the love-nature of the Uranian is of a sincere and essentially humane and kindly type then the importance of the Uranian's place in Society, and of the social work he may be able to do, must certainly also be acknowledged.

FOOTNOTES

[9] See Appendix, pp. 153-156.

[10] A good deal in this description may remind readers of history of the habits and character of Henry III. of France.

[11] Perhaps, like Queen Christine of Sweden, who rode across Europe, on her visit to Italy, in jack-boots and sitting astride of her horse. It is said that she shook the Pope’s hand, on seeing him, so heartily that the doctor had to attend to it afterwards!

[12] “Homosexual,” generally used in scientific works, is of course a bastard word. “Homogenic” has been suggested, as being from two roots, both Greek, _i.e._, “homos,” same, and “genos,” sex.

[13] “Athenæus” xiii., ch. 78.

[14] See Plutarch’s “Eroticus,” §xvii.

[15] See “Natural History of Man,” by J. G. Wood. Vol: “Africa,” p. 419.

[16] See also Livingstone’s “Expedition to the Zambesi” (Murray, 1865) p. 148.

[17] Though these two plays, except for some quotations, are lost.

[18] Mantegazza and Lombroso. See Albert Moll, “Conträre Sexualempfindung,” 2nd ed., p. 36.

[19] Though in translation this fact is often by pious fraudulence disguised.

[20] W. Pater’s “Renaissance,” pp. 8-16.

[21] Among _prose_ writers of this period, Montaigne, whose treatment of the subject is enthusiastic and unequivocal, should not be overlooked. See Hazlitt’s “Montaigne,” ch. xxvii.

[22] I may be excused for quoting here the sonnet No. 54, from J. A. Symonds’ translation of the sonnets of Michel Angelo:--

“From thy fair face I learn, O my loved lord, That which no mortal tongue can rightly say: The soul, imprisoned in her house of clay, Holpen by thee to God hath often soared: And though the vulgar, vain, malignant horde Attribute what their grosser wills obey, Yet shall this fervent homage that I pay, This love, this faith, pure joys for us afford, Lo, all the lovely things we find on earth, Resemble for the soul that rightly sees, That source of bliss divine which gave us birth: Nor have we first-fruits or remembrances Of heaven elsewhere. Thus, loving loyally, I rise to God, and make death sweet by thee.”

The labours of von Scheffler, followed by J. A. Symonds, have now pretty conclusively established the pious frauds of the nephew, and the fact that the love-poems of the elder Michel Angelo were, for the most part, written to male friends.

[23] See an interesting paper in W. Pater’s “Renaissance.”

[24] For a fuller collection of instances of this Friendship-love in the history of the world, see “Ioläus: an Anthology,” by E. Carpenter (George Allen, London. 3/- net). Also “Liebling-minne und Freundesliebe in der Welt-literatur,” von Elisar von Kupffer (Adolf Brand, Berlin, 1900).

[25] As in the case, for instance, of Tennyson’s “In Memoriam,” for which the poet was soundly rated by the _Times_ at the time of its publication.

[26] Jowett’s “Plato,” 2nd ed., vol. ii., p. 30.

[27] Jowett, vol. ii., p. 130.

[28] One ought also to mention some later writers, like Dr. Magnus Hirschfeld and Dr. von Römer, whose work though avowedly favourable to the Urning-movement, is in a high degree scientific and reliable in character.

[29] From _Uranos_--see, for derivation, p. 20, _supra_--also Plato's "Symposium," speech of Pausanias.

[30] See, for estimates, Appendix, pp. 134-136.

[31] Though there is no doubt a general _tendency_ towards femininity of type in the male Urning, and towards masculinity in the female.

[32] "Gli amori degli uomini."

[33] "Psychopathia Sexualis," 7th ed., p. 227.

[34] _Ibid_, pp. 229 and 258. See Appendix, p. 160.

[35] "How deep congenital sex-inversion roots may be gathered from the fact that the pleasure-dream of the male Urning has to do with male persons, and of the female with females."--Krafft-Ebing, "P.S.," 7th ed., p. 228.

[36] "Conträre Sexualempfindung," 2nd ed., p. 269.

[37] See "Love's Coming-of-Age," p. 22.

[38] Pub.: F. A. Davis, Philadelphia, 1901.

[39] Otto Weininger even goes further, and regards the temperament as a natural intermediate form ("Sex and Character," ch. iv.) See also Appendix, _infra_, p. 169.

[40] "Though then before my own conscience I cannot reproach myself, and though I must certainly reject the judgment of the world about us, yet I suffer greatly. In very truth I have injured no one, and I hold my love in its nobler activity for just as holy as that of normally disposed men, but under the unhappy fate that allows us neither sufferance nor recognition I suffer often more than my life can bear."--Extract from a letter given by Krafft-Ebing.

[41] See "In the Key of Blue," by J. A. Symonds (Elkin Mathews, 1893).

[42] See Appendix, pp. 162 and 163.

[43] See also "Love's Coming-of-Age," 5th ed., pp. 173, 174.

[44] See "Das Conträre Geschlechtsgefühl," von Havelock Ellis und J. A. Symonds (Leipzig, 1896).

[45] "Symposium," Speech of Socrates.

[46] It is interesting in this connection to notice the extreme fervour, almost of romance, of the bond which often unites lovers of like sex over a long period of years, in an unfailing tenderness of treatment and consideration towards each other, equal to that shown in the most successful marriages. The love of many such men, says Moll (p. 119), "developed in youth lasts at times the whole life through. I know of such men, who had not seen their first love for years, even decades, and who yet on meeting showed the old fire of their first passion. In other cases, a close love-intimacy will last unbroken for many years."

[47] Though, inconsistently enough, making no mention of females.

[48] Dr. Moll maintains (2nd ed., pp. 314, 315) that if familiarities between those of the same sex are made illegal, as immoral, self-abuse ought much more to be so made.

[49] Though it is doubtful whether the marriage-laws even do this.

[50] In France, since the adoption of the Code Napoleon, sexual inversion is tolerated under the same restrictions as normal sexuality; and according to Carlier, formerly Chief of the French Police, Paris is not more depraved in this matter than London. Italy in 1889 also adopted the principles of the Code Napoleon on this point. For further considerations with regard to the Law, see Appendix, pp. 164 and 165.

[51] For further instances, see Appendix, pp. 143-148.

[52] See Müller's "History and Antiquities of the Doric Race."

[53] Müller.

[54] Cf. the incident at the end of Plato's "Lysis," when the tutors of Lysis and Menexenus come in and send the youths home.

[55] For a useful little manual on this subject, see "How We are Born," by Mrs. N. J. (Daniel, London, price 2/-). For a general argument in favour of sex-teaching see "The Training of the Young in Laws of Sex," by Canon Lyttelton, Headmaster of Eton College (Longmans, 2/6).

[56] See J. G. Wood's "Natural History of Man," vol. "Africa," p. 324 (the Bechuanas); also vol. "Australia," p. 75.

[57] With the rapid rise which is taking place, in scope and social status, of the state day-schools, it is probable that some change of opinion will take place with regard to the wisdom of sending young boys of ten to fourteen to upper-class boarding-schools. For a boy of fifteen or sixteen and upwards the boarding-school system may have its advantages. By that time a boy is old enough to understand some questions; he is old enough to have some rational ideal of conduct, and to hold his own in the pursuit of it; and he may learn in the life away from home a lot in the way of discipline, organization, self-reliance, etc. But to send a young thing, ignorant of life, and quite unformed of character, to take his chance by day and night in the public school as it at present exists, is--to say the least--a rash thing to do.

[58] It should be also said, in fairness, that the fear of showing undue partiality, often comes in as a paralysing influence.

APPENDIX

"In this country [Britain] we have too long, from a sense of mock modesty, neglected the science relating to sex. In Germany this is not so. There we find workers who have elaborated for themselves a new science, and who have given to the world knowledge which is of the very utmost importance. We now know that there are females with strong male characteristics, and _vice-versa_. Anatomically and mentally we find all shades existing from the pure genus man to the pure genus woman. Thus there has been constituted what is well named by an illustrious exponent of the science 'The Third Sex'."--Dr. JAMES BURNET, _The Medical Times and Hospital Gazette_, vol. xxxiv., No. 1497, 10th November, 1906. London.

"Every citizen of age to fulfil his duties as a citizen, whether he be a father or husband, teacher or pupil, master or servant, official or subordinate, has the right, and owes it as a duty, to know the facts of sexual inversion, to combat and to prevent debauchery, crime and vice, to learn and to teach others the place of inversion in Society, and its morals, the duties of the invert towards himself, and towards other inverts, towards the normal man, and towards women and children. And the duties of the normal man towards the invert are no less--no less difficult, no less indispensable."--M. A. RAFFALOVICH, "Uranisme et Unisexualité." Paris, 1896.

"That sex inversion is not a chance phenomenon … appears from the fact that it has been observed at all times and in all places, and among peoples quite separate from each other."--A. MOLL, "Die Conträre Sexualempfindung," 2nd Edition, p. 15. Berlin, 1893.

"Concerning the wide prevalence of sexual inversion, and of homosexual phenomena generally, there can be no manner of doubt. In Berlin, Moll states that he has himself seen between six hundred and seven hundred homosexual persons, and heard of some two hundred and fifty to three hundred others. I have much evidence as to its frequency both in England and the United States. In England, concerning which I can naturally speak with most assurance, its manifestations are well-marked for those whose eyes have been opened…. Among the professional and most cultured element of the middle class in England there must be a distinct

percentage of inverts, which may sometimes be as much as five per cent., though such estimates must always be hazardous. Among women of the same class the percentage seems to be at least double--though here the phenomena are less definite and deepseated."--HAVELOCK ELLIS, "Psychology of Sex," vol. _Sexual Inversion_, pp. 29, 30. Philadelphia, 1901.

"According to the information of De Joux in 'The Disinherited of Love,' the number of Urnings in all Europe is about five millions; about 4.5 per cent. of all males in Europe are Urnings, while only 0.1 per cent. of females are Urningins. A malady therefore--if malady it should be called--which is so widespread certainly demands our deepest interest; and it is strange that it is only since the '70's that this subject has been discussed in scientific literature.

"It is owing to this ignorance that the public mind has been dominated, and still is dominated, by the prejudice, that psychical hermaphroditism and sex-inversion are nothing but crimes, wilful crimes, whereas they proceed necessarily out of the inborn nature of such individuals."--NORBERT GRABOWSKY, "Die verkehrte Geschlechtsempfindung," p. 16. Leipzig, 1894.

Dr. HIRSCHFELD, in his "Statistischen Untersuchunge über den Prozentensatz der Homosexuellen," gives the result of various statistical investigations on this subject; and their remarkable agreement enables him to speak with some confidence. He says (p. 41), "Now we _know_ that we must reckon the numbers of those who vary from the normal, not by fractions of thousands but by fractions of hundreds. The fact that, as a result of these circular enquiries and commissions about the same figure has emerged (for the proportion of exclusively homosexual persons), namely, a figure in the neighbourhood of 1½ per cent.--this extraordinary agreement cannot possibly be a chance, but must rest on a law--a law of nature--namely, that only 90 to 95 per cent. of mankind are normally sexual by birth; that about 1½ to 2 per cent. are born pure homosexuals (say about 1,000,000 in Germany); and that between the two classes there remain some 4 per cent. who are bisexual by nature."

And again (p. 60), "But what do these figures show? They show that of 100,000 inhabitants on the average only 94,600 are sexually normal, while 5,400 vary from the normal. Of these latter 1,500 are exclusively homosexual, and 3,900 bisexual. While of these last again 700 are _predominantly_ homosexual; so that of 100,000 Germans, 2,200 (or 2.2 per cent.) are either exclusively or predominantly homosexual--making 1,200,000 for the whole German Fatherland."

"Sexual inversion has usually been regarded as psycho-pathological, as a symptom of degeneration; and those who exhibit it have been considered as physically unfit. This view, however, is falling into disrepute, especially as Krafft-Ebing, its principal champion, abandoned it in the later editions of his work. None the less, it is not generally recognised that sexual inverts may be otherwise perfectly healthy, and with regard to other social matters quite normal. When they have been asked if they would have wished matters to be different with them in this respect, they almost invariably answer in the negative."--O. WEININGER, "Sex and Character," ch. iv. Heinemann, London, 1906.

"It is a common belief that a male who experiences love for his own sex must be despicable, degraded, depraved, vicious, and incapable of humane or generous sentiments. If Greek history did not contradict this supposition, a little patient enquiry into contemporary manners would suffice to remove it."--J. ADDINGTON SYMONDS, "A Problem in Modern Ethics," p. 10.

"Mantegazza rightly insists that Urnings are found by no means only among the dregs of the people, but that they are rather to be noted in circles which in respect of culture, wealth, and social position rank among the first. Thus, among the aristocracy without doubt a great number of Urnings are to be found."--A. MOLL, _op. cit._ p. 76.

"In no rank are there so many Urnings as among servants. One may say that every third male domestic is an Urning."--DE JOUX, "Die Enterbten des Liebesglückes," p. 193. Leipzig, 1893.

"It is therefore certain, as we have seen, that many Urnings come from nervous or pathologically disposed families.… All the same, I must say that there is no proof to hand in _all_ cases of sex-inversion among men, that the individuals concerned are thus hereditarily weighted. And besides, there is the consideration that the extension, according to some authors, of hereditary trouble is at present so great that one may prove a tendency to nervous or mental maladies in almost everybody."--A. MOLL, _op. cit._, p. 221.

"The truth is that we can no more explain the inverted sex-feeling than we can the normal impulse; all the attempts at explanation of these things, and of Love, are defective."--_Ibid_, p. 253.

"Among the _penchants_ of Urnings one finds not infrequently a great partiality for Art and Music--and indeed, for active interest in the same as well as passive enjoyment … the Actor's talent is especially noticeable among some.… But it must not be thought that

Urnings are only capable of a special activity of the imagination. On the contrary, there are undoubted cases in which they contribute something in the scientific direction.… Also in Poetry do Urnings occasionally show exceptional talent; especially in love-verses addressed to men."--_Ibid_, p. 80.

"An examination of my cases [of Inverts] reveals the interesting fact that 68 per cent. possess artistic aptitude in varying degree. Galton found, from the investigation of nearly 1,000 persons that the average showing artistic tastes in England is only about 30 per cent."--HAVELOCK ELLIS, "Sexual Inversion," p. 173.

"In Antiquity, especially among the Greeks, there seem to have been numbers of men who in their emotional natures were hermaphrodites. I think that the study of psychical hermaphrodisy is most important, and will throw yet greater light on the psychology of Love itself. Observation so far already shows that the same individual at differing times can experience quite different sexual feelings."--A. MOLL, _op. cit._, p. 200.

"The Urning is capable, through the force of his love, of making the greatest sacrifices for his beloved, and on that account the love of the Urning has been often compared with Woman's love. Just as the Woman's love is stronger and more devoted than that of the normal man, just as it exceeds that of the Man in inwardness, so, according to Ulrichs should the Urning's love in this respect stand higher than that of the woman-loving Man."--_Ibid_, p. 118.

"Womanish men often know how to treat women better than manly men do. Manly men, except in most rare cases, learn how to deal with women only after long experience, and even then most imperfectly."--O. WEININGER, "Sex and Character," ch. v.

"Is it really the case that all women and men are marked off sharply from each other, the women on the one hand alike in all points, the men on the other?… There are transitional forms between the metals and non-metals, between chemical combinations and simple mixtures, between animals and plants, between phanerogams and cryptogams, and between mammals and birds.… The improbability may henceforth be taken for granted of finding in Nature a sharp cleavage between all that is masculine on the one side and all that is feminine on the other; or that any living being is so simple in this respect that it can be put wholly on one side, or wholly on the other, of the line."--WEININGER, _Ibid_, introduction, p. 2.

"Upon this, Chéron made a rather strange observation. 'We have,' she said, 'with regard to sexual distinctions, notions that were not dreamed of by the primitive simplicity of the people of the age now gone by. From the fact that there are two sexes, and only two, they for a long time drew false inferences. They concluded that a woman is simply a woman, and a man simply a man. In reality this is not so; there are women who are very much women, and women who are very little so. Such differences, concealed in former times by costume and mode of life, and masked by prejudice, stand out clearly in our society. And not only so, but they become more accentuated and apparent in each generation.'"--ANATOLE FRANCE, "Sur la Pierre Blanche," p. 301.

"In _every_ human being there are present both male and female elements, only in normal persons (according to their sex) the one set of elements is more greatly developed than the other. The chief difference in the case of homosexual persons is that in them the male and female elements are more equalized; so that when, in addition, the general development is of a high grade, we find among this class the most perfect types of humanity."--Dr. ARDUIN, "Die Frauenfrage," in _Jahrbuch der Sexuellen Zwischenstufen_, vol. ii., p. 217. Leipzig, 1900.

"The notion that human beings were originally hermaphroditic is both ancient and widespread. We find it in the book of Genesis, unless indeed there be a confusion here between two separate theories of creation. God is said to have first made man in His image, male and female in one body, and to have bidden them multiply. Later on He created the woman out of part of this primitive man." (See also the myth related by Aristophanes in Plato's Symposium.)--HAVELOCK ELLIS, "Sexual Inversion," p. 229.

"When the sexual instinct first appears in early youth, it seems to be much less specialised than normally it becomes later. Not only is it, at the outset, less definitely directed to a specific sexual end, but even the sex of its object is sometimes uncertain."--_Ibid_, p. 44.

"In me the homosexual nature is singularly complete, and is undoubtedly congenital. The most intense delight of my childhood (even when a tiny boy in my nurse's charge) was to watch acrobats and riders at the circus. This was not so much for the skilful feats as on account of the beauty of their persons. Even then I cared chiefly for the more lithe and graceful fellows. People told me that circus actors were wicked and would steal little boys, and so I came to look on my favorites as half-devil and half-angel. When I was older and could go about alone, I would often hang around the tents of travelling shows in hope of catching a glimpse of the actors. I longed to see them naked, without their tights, and used to lie awake at night, thinking of them and longing to be embraced

and loved by them."--_Ibid_, "case" ix., p. 62.

"I was fifteen years and ten-and-a-half months old when the first erotic dream announced the arrival of puberty. I had had no previous experience of sex-satisfaction, either in the Urning direction or in any other. This occurrence therefore came about quite normally. From a much earlier time, however, I had been subject partly to tender yearnings and partly to sensual longing without definite form and purpose--the two emotions being always separate from each other and never experienced for one and the same young man. These aimless sensual longings plagued me often in hours of solitude; and I could not overcome them. They showed themselves first, during my fifteenth year, when I was at school at Detmold, in the following two ways:--First, they were awakened by a drawing in Normand's "Saülen-ordnungen," of the figure of a Greek god or hero, standing there in naked beauty. This image, a hundred times put away, came again a hundred times before my mind. (I need not say it did not _cause_ the Urning temperament in me; it merely awoke what was slumbering there already--a thing that any other circumstance might have done.) Secondly, when studying in my little room, or when I lay upon my bed before going to sleep, the thought used suddenly and irresistibly to rise up in my mind--"If only a soldier would clamber through the window and come into my room!" Then my imagination painted me a splendid soldier-figure of twenty to twenty-two years old; and I was, as it were, all on fire. And yet my thoughts were quite vague, and undirected to any definite satisfaction; nor had I ever spoken a word with a real soldier."--K. H. ULRICHS, "Memnon," §77. Leipzig, 1898. See also "A Problem in Modern Ethics," p. 73.

"The friendships of this kind which I formed at School were two in number--I shall never forget the absorbing depth and intensity of them. I never talked about them to anyone else, they were much too sacred and serious for that, nor--strange as it may seem--did I ever speak of them to the boys themselves, or indeed, show any signs of affection towards them. If they had been told that I was devoted to their welfare, and willing to sacrifice myself and all I had to it (which was indeed the fact) they would have been simply astonished; more especially as they were both young boys not yet arrived at puberty.

"I am at present somewhat bitterly conscious that in these cases one of the strongest influences for good that ever came into my life was nine-tenths wasted. How much better it all might have been under more favourable surroundings it is impossible to imagine. Still, it was not without its good influence on me, though (owing to their complete ignorance of my feelings) it could have had none whatever on the boys. I was conscious of a bracing and inspiring effect on my whole nature, a confirmed health of body, and most of all, of a greatly increased capacity for work. And doubtless all this might have been intensified a thousand fold if I had been ever so little guided and encouraged by public opinion sanctioning these friendships.

"The Public School boy has after all strong feelings of honour and fairness: and I am sure much might be done by cultivating the Public Opinion of the school: making devoted and disinterested friendships highly thought of and praised, and condemning as base and mean the least attempt to befoul a young boy's purity through a gross and selfish desire for personal gratification. School public opinion would, I am sure, tend quite readily to flow in such channels. But this would demand an openness of treatment of the whole question such as does not at present exist. That the greatest force the schoolmaster has at his command should be so ignored (and so needlessly) is more than absurd: it is monstrous. And it concerns him as a teacher quite as much as the boys themselves in their relations with each other. I believe that gaining a boy's affection is the necessary preliminary to really _teaching_ him anything. Otherwise you do not really teach him at all."--_Private letter._

"I could tell you a good deal of another equally strong friendship I formed (myself twenty-five, boy fourteen) which was one of the happiest events of my life. It was acknowledged on both sides, but perfectly restrained and pure: and we saw a great deal of each other during most of the school holidays for about a year. I could have done anything with that boy, my influence over him was for the time being I should say unlimited: and undoubtedly _immense_ good accrued to us both."--_Ibid_.

"In my own school-life--as a day scholar--I had two such friendships, though of course in a day school there was not the same possibility of their development. One was with an elder boy some five years my senior, and the other with a master some twelve years older than myself. I was a shy, timid youngster, and not having a robust physique did not enter much into the ordinary athletics of the school. My elder friend was a very delicate, gentle, refined boy with a purity and loftiness of mind in striking contrast to the filthy moral atmosphere of the school at that time, but he was never censorious or self-righteous. I feel that this friendship was the most powerful influence in my early life in keeping a high ideal of conduct before me--much more powerful than the influence of home, which I do not think I was at all conscious of.

"After he left school, for Cambridge, we used to write regularly to one another--long letters, hardly ever less than three sheets in length. I remember I used to think him the most handsome man I knew, but looking now at his photo, taken about that time and

comparing it with others, I see that his features were inferior to many others of my school-fellows. At the end of his second year he died of consumption. It was during the Long Vacation, and I was abroad at the time. I remember I used to sit up late into the night writing very long letters to him about all I had seen, to interest him during his illness. I did not know how ill he really was, but I had a terrible fear that I should not see him again. When I got back and found he had just died the shock was awful. For weeks I felt as if I had not a friend in the whole world. I have never felt any loss so keenly either before or since.…

“The other friendship with my mathematical master, though not so intimate, was still of a very affectionate character. I feel I owe a great deal to it--he laid the foundation of my ideal of a teacher’s duty to his pupils.”--_Private letter._

“It is not new in itself; this, the feeling that drew Jesus to John, or Shakespeare to the youth of the sonnets, or that inspired the friendships of Greece, has been with us before, and in the new citizenship we shall need it again. The Whitmanic love of comrades is its modern expression; Democracy--as socially, not politically conceived--its basis. The thought as to how much of the solidarity of labour and the modern Trade-Union movement may be due to an unconscious faith in this principle of comradeship, is no idle one. The freer, more direct, and more genuine relationship between men, which is implied by it, must be the ultimate basis of the reconstructed Workshop.”--C. R. ASHBEE, “Workshop Reconstruction and Citizenship,” p. 160.

A case of passionate attachment between two Indian boys was told to the author of the present book by a master at a school in India. The boys--who were about sixteen years of age--were both at the same school, and were devoted friends; but the day came when they had to part. One was taken away by his parents to go to a distant part of the country. The other was inconsolable at the prospect. When the day arrived, and his companion was removed, he soon after went quietly to a well in the school precincts, jumped in, and was drowned. The news, sent on by wire, reached the departing friend while still on his journey. He said little, but at one of the stations left the train and disappeared. The train went on, but at a little distance out, the boy ran out of the bushes by the line, threw himself on the rails, and was killed.

The following is taken from one of the “cases” recorded by Havelock Ellis in his “Sexual Inversion”; “The earliest sex-impression that I am conscious of is at the age of nine or ten falling in love with a handsome boy who must have been about two years my senior. I do not recollect ever having spoken to him, but my desire, as far as I can recall, was that he should seize hold of and handle me. I have a distinct impression yet of how pleasurable even physical pain or cruelty would have been at his hands.”--HAVELOCK ELLIS, _op. cit._, “case” xiii., p. 71.

“When I was about sixteen-and-a-half years old, there came into the house a boy about two years younger than myself, who became the absorbing thought of my school-days. I do not remember a moment, from the time I first saw him to the time I left school, that I was not in love with him, and the affection was reciprocated, if somewhat reservedly. He was always a little ahead of me in books and scholarship, but as our affection ripened we spent most of our spare time together, and he received my advances much as a girl who is being wooed, a little mockingly perhaps, but with real pleasure. He allowed me to fondle and caress him, but our intimacy never went further than a kiss, and about that even was the slur of shame; there was always a barrier between us, and we never so much as whispered to one another concerning those things of which all the school obscenely talked.”--_Same case_, p. 73.

“At the age of twenty-one I began gradually to remark that I was not somehow like my comrades, that I had no pleasure in male occupations, that smoking, drinking, and card-playing gave me little satisfaction, and that I had a real death-horror of a brothel. And, as a matter of fact, I had never been in one, as on every occasion under some pretext or other I have succeeded in stealing off. I now began to think about myself; I felt myself frightfully desolate, miserable and unfortunate, and longed for a friend of the same nature as myself--yet without dreaming that there could be other such men. At the age of twenty-two I came to know a young man who at last cleared up my mind about sexual inversion and those affected with it, since he--an Urning, like myself--had fallen in love with me. The scales fell from my eyes, and I bless the day which brought light to me.… Towards woman in her sexual relation I feel a real horror, which the exercise of all my strongest powers of imagination would not avail to overcome; and indeed, I have never attempted to overcome it, since I am quite persuaded of the fruitlessness of such an attempt, which to me appears sinful and unnatural.”--KRAFFT-EBING, “Psychopathia Sexualis,” 7th edition, “case” No. 122, p. 291. Stuttgart, 1892.

“I can no longer exist without men’s love; without such I must ever remain at strife with myself.… If marriage between men existed I believe I should not be afraid of a life-long union--a thing which with a woman seems to be something impossible.… Since, however, this kind of love is reckoned criminal, by its satisfaction I can be at harmony with myself but never with the world, and necessarily in consequence must ever be somewhat out of tune; and all the more so because my character is open, and I hate lies

of all kinds. This torment, to have always to conceal everything, has forced me to confess my anomaly to a few friends, of whose understanding and reticence I am sure. Although oftentimes my condition seems to me sad enough, by reason of the difficulty of satisfaction and the general contempt of manly love, yet I am often just a little proud on account of having these anomalous feelings. Naturally, I shall never marry--but this seems to me by no means a misfortune, although I am fond of family life, and up to now have passed my time only among my own relations. I live in the hope that later I shall have a permanent loved one; such indeed I must have, else would the future seem gray and drear, and every object which folk usually pursue--honour, high position, etc.--only vain and unattractive.

“Should this hope not be fulfilled, I know that I should be unable, permanently and with pleasure, to give myself to my calling, and that I should be capable of setting aside everything in order to gain the love of a man. I feel no longer any moral scruples on account of my anomalous leaning, and generally have never been troubled because I felt myself drawn to youths.… Up to now it has only seemed to me bad and immoral to do that which is injurious to another, or which I would not wish done to myself, and in this respect I can say that I try as much as possible not to infringe on the rights of others, and am capable of being violently roused by any injustice done to others.”--_Ibid_, p. 249, “case” No. 110 (official in a factory, age 31).

“My thoughts are by no means exclusively of the body or morbidly sensual. How often at the sight of a handsome youth does a deeply enthusiastic mood come upon me, and I offer a prayer, so to speak, in the glorious words of Heine--”Du bist wie eine Blume, so hold, so schön, so rein“.… Never has a young man yet guessed my love for him, I have never corrupted or damaged the morals of one, but for many have I here and there smoothed their pathway; and then I stick at no trouble and make sacrifices such as I can only make for them.

“When thus I have a chance to have a loved friend near me, to teach, to support and help, when my unconfest love finds a loving response (though naturally not sexual), then all the unclean images fade more and more from my mind. Then does my love become almost platonic, and lifts itself up--only to sink again in the mire, when it is deprived of its proper activity.

“For the rest, I am--and I can say it without boasting--not one of the worst of men. Mentally more sensitive than most average folk, I take interest in everything that moves mankind. I am kindly-disposed, tender, and easily moved to pity, can do no injury to any animal, certainly not to a human being, but on the contrary am active in a human-friendly way, where and however I can.

“Though then before my own conscience I cannot reproach myself, and though I must certainly reject the judgment of the world about us, yet I suffer greatly. In very truth I have injured no one; and I hold my love in its nobler activity for just as holy as that of normally disposed men, but under the unhappy fate that allows us neither sufferance nor recognition, I suffer often more than my life can bear.”--_Ibid_, p. 268, “case” No. 114.

“To depict all the misery, all the unfortunate situations, the constant dread of being found out in one’s peculiarity and of becoming impossible in society--to give an idea of all this is truly more than pen or words can compass. The very thought, so soon as it arises, of losing one’s social existence and of being rejected by everybody is more torment than can be imagined. In such a case, everything, everything would be forgotten that one had ever done in the way of good; in the consciousness of his lofty morality every normally disposed man would puff himself up, however frivolously he might really have acted in the matter of his love. I know many such normal folk whose unworthy conception of their love is indeed hard for me to understand.”--_Ibid_, p. 269.

“The torturing images of betrayed love prevent my sleeping, so that I am forced, now and again, to have recourse to chloral. My dreams are only a continuation of actual life, and just as painful. How all this will end I really know not; but I suppose these root-emotions must take their own course.… The only reasonable end of the struggle is Death.”--A. MOLL, “Conträre Sexualempfindung,” 2nd edition, p. 123 (quotation from a letter).

“Weary and worn, I have passed through every tempest of anguish and despair. Years of the most racking mental agony have gone over my head without killing me. Through the long night watches I have heard the unceasing hours toll. Sleep has never been thought of by me, but I have lain on my bed trying to read some book, or have knelt by my bedside and endeavoured to raise my heart and spirit in prayer for succour or forgiveness. At last, unable to hold out any longer, with mouth tight-closed and knitted brow the Charmer has deadened my senses for one or two brief hours; but only that I may wake to a stronger and clearer perception of my hopeless condition.

“How the days have got on I know not. How I can have lived so long through such misery I know not. But torture like this is cruelly slow, whilst it is sure. It is the nature of youth to be long-enduring where Love is put to the test and a kind of occasional flicker--a

kind of mocking semblance of hope, as like to hope as the rushing meteor is to the enduring sun--helps to support the load of misery, and so to prolong it. I am hundreds of years old in this my wretchedness of every moment. I cannot battle against Love and crush it out--never! God has implanted the necessity of the sentiment in my heart; it is scarce possible not to ask oneself why has He implanted so divine an element in my nature, which is doomed to die unsatisfied, which is destined in the end to be my very death?"--_From a manuscript left to the Author by an Urning._

H. ELLIS, in Appendix D. of his book on "Sexual Inversion," speaks at some length on the School-friendships of girls: what they call "Flames" and "Raves"; of love at first sight; romance; courtship; meetings despite all obstacles; long letters; jealousy; the writing the beloved's name everywhere, etc. These alliances are sometimes sexual, but oftener not so--though full of "psychic erethism."

In the same Appendix he quotes a woman of thirty-three, who writes, "At fourteen I had my first case of love, but it was with a girl. It was insane, intense love, but had the same quality and sensations as my first love with a man at eighteen. In neither case was the object idealized: I was perfectly aware of their faults; nevertheless, my whole being was lost, immersed, in their existence. The first lasted two years, the second seven years. No love has since been so intense, but now these two persons, though living, are no more to me than the veriest stranger."

Another woman of thirty-five writes, "Girls between the ages of fourteen and eighteen at college or girls' schools often fall in love with the same sex. This is not friendship. The loved one is older, more advanced, more charming or beautiful. When I was a freshman in college I knew at least thirty girls who were in love with a senior. Some sought her because it was the fashion, but I knew that my own homage and that of many others was sincere and passionate. I loved her because she was brilliant and utterly indifferent to the love shown her. She was not pretty, though at the time we thought her beautiful. One of her adorers, on being slighted, was ill for two weeks. On her return she was speaking to me when the object of our admiration came into the room. The shock was too great, and she fainted. When I reached the senior year I was the recipient of languishing glances, original verses, roses, and passionate letters written at midnight and three in the morning."

"Passionate friendships among girls, from the most innocent to the most elaborate excursions in the direction of Lesbos, are extremely common in theatres, both among actresses, and even more among chorus and ballet-girls."--HAVELOCK ELLIS, "Sexual Inversion," p. 130.

"The love of homosexual women is often very passionate, as is that of Urnings. Just like these, the former often feel themselves blessed when they love happily. Nevertheless, to many of them, as to the Urning, is the circumstance very painful that in consequence of their antipathy to the touch of the male they are not in the position to found a family. Sometimes, when the love of a homosexual woman is not responded to, serious disturbances of the nerve-system may ensue, leading even to paroxysms of fury."--A. MOLL, _op. cit._, p. 338.

"It is noteworthy how many inverted women have, with more or less fraud, been married to the woman of their choice, the couple living happily together for long periods. I know of one case, probably unique, in which the ceremony was gone through without any deception on any side; a congenitally inverted English woman of distinguished intellectual ability, now dead, was attached to the wife of a clergyman, who, in full cognisance of all the facts of the case, privately married the two ladies in his own church."--HAVELOCK ELLIS, _op. cit._, p. 146, footnote.

"Seven or eight girls, we are told (in Montaigne's 'Journal du Voyage en Italie,' 1350), belonging to Chaumont, resolved to dress and to work as men; one of these came to Vitry to work as a weaver, and was looked upon as a well-conditioned young man, and liked by everyone. At Vitry she became betrothed to a woman, but, a quarrel arising, no marriage took place. Afterwards, 'she fell in love with a woman whom she married, and with whom she lived for four or five months, to the wife's great contentment, it is said; but having been recognised by some one from Chaumont, and brought to justice, she was condemned to be hanged. She said she would even prefer this to living again as a girl, and was hanged for using illicit inventions to supply the defects of her sex'."--_Ibid_, p. 119.

"It is evident that there must be some radical causes for the frequency of homosexuality among prostitutes. One such cause doubtless lies in the character of the prostitute's relations with men; these relations are of a professional character, and, as the business element becomes emphasized, the possibility of sexual satisfaction diminishes; at the best also there lacks the sense of social equality, the feeling of possession, and scope for the exercise of feminine affection and devotion."--_Ibid_, p. 149.

“Among the inscribed prostitutes of Berlin there are without doubt a great number who honour the love of women. I am told from well-informed sources, that about twenty-five per cent. of the prostitutes of Berlin have relations with other women.”--A. MOLL, _op. cit._, p. 331.

“Karl Heinrich Ulrichs (born in 1825 near Aurich), who for many years expounded and defended homosexual love, and whose views are said to have had some influence in drawing Westphal’s attention to the matter, was a Hanoverian legal official (Amts-assessor), himself sexually inverted. From 1864 onward, at first under the name of ‘Numa Numantius,’ and subsequently under his own name, Ulrichs published in various parts of Germany a long series of works dealing with this question, and made various attempts to obtain a revision of the legal position of the sexual invert in Germany.

“Although not a writer whose psychological views can carry much scientific weight, Ulrichs appears to have been a man of most brilliant ability, and his knowledge is said to have been of almost universal extent; he was not only well-versed in his own special subjects of jurisprudence and theology, but in many branches of natural science, as well as in archæology; he was also regarded by many as the best Latinist of his time. In 1880 he left Germany and settled in Naples, and afterwards at Aquila in the Abruzzi, whence he issued a Latin periodical. He died in 1895.”--HAVELOCK ELLIS, _op. cit._, p. 33.

Ulrichs enters into an elaborate classification of human types, with a corresponding nomenclature, which, though somewhat ponderous, has been of use. Among males, for instance, he distinguishes the quite normal man, whom he calls “Dioning,” from the invert, whom he calls “Urning.” Among Urnings, again, he distinguishes (1) those who are thoroughly manly in appearance and in mental habit and character (“Mannlings”), and who tend to love softer and younger specimens of their own sex; (2) those who are effeminate in appearance and cast of mind (“Weiblings”), and who love rougher and older men; and (3) those who are of a medium type (“Zwischen Urnings”) and love young men. Then again there is the “Urano-dioning,” who is born with a capacity of love in both directions, _i.e._, for women and for men. He is generally of the manly type. And besides these, some sub-species, like the “Uraniaster,” who is a normal man who has contracted the Urning habit, and the “Virilised Urning,” who is an Urning who has contracted the normal habit, though this is not really natural to him! The whole may be set out in a table as follows:--

{ (_a_) Normal Man or Dioning--called Uraniaster when { he acquires Urning tendencies. { The { {1. Mannling. Human { {2. Zwischen-Urning. Male { (_b_) Urning {3. Weibling. { {4. Also called Virilised Urning when he { { acquires the normal habit. { { (_c_) Urano-dioning.

If we add to this a corresponding table for the female we shall have an idea of the complication of Ulrichs’ system! Yet, complex as it is, and whatever criticisms we may make upon it, we must allow that it does not exceed the complexity of the real facts of Nature. (See K. H. ULRICHS’ “Memnon,” ch. iii.-v.)

Krafft-Ebing’s analysis of the subject is fully as elaborate as that of Ulrichs. It is given by J. A. SYMONDS in the form of a table, as follows:--

{ { Persistent. { Acquired { Episodical. { Sexual { { Psychic Hermaphrodites. Inversion { { { { { Male Habitus (Mannlings). { Congenital { Urnings { Female Habitus (Weiblings). { { { { Androgyni.

And Symonds continues:--“What is the rational explanation of the facts presented to us by the analysis which I have formulated in this table, cannot as yet be thoroughly determined. We do not know enough about the law of sex in human beings to advance a theory. Krafft-Ebing and writers of his school are at present inclined to refer them all to diseases of the nervous centres, inherited, congenital, excited by early habits of self-abuse. The inadequacy of this method I have already attempted to set forth; and I have also called attention to the fact that it does not sufficiently account for the phenomena known to us through history and through every-day experience.” [It should be noted that in later editions of his book Krafft-Ebing considerably modifies the view that these sex-variations all indicate disease.]--“A Problem in Modern Ethics,” p. 46.

Moll, speaking of the act so commonly credited to Urnings (sodomy), says:--“The common assumption is that the intercourse of Urnings consists in this. But it is a great error to suppose that this act is so frequent among them.”--A. MOLL, _op. cit._, p. 139.

And Krafft-Ebing also speaks of it as rare among true Urnings, though not uncommon among old roués and debauchees of more normal temperament.--“Psychopathia Sexualis,” 7th edition, p. 258.

“The Urning denies not only the ‘unnaturalness’ of his leanings, but also their pathological character; he protests against comparison with the lame and the deaf. The occasional coincidence of sexual inversion with other really morbid conditions settles

nothing, nor is the reminder that it is antagonistic to the purpose of race-propagation a proof; for who can assure us that Nature has intended all people for race-propagation? Even to the worker-bee Nature has not granted this function, although in her stunted female sex-organs there exists an undeniable indication or suggestion of sex-feeling."--A. MOLL, _op. cit._, p. 271. (From a letter by a sixty year old Urning.)

"Homosexuality, therefore, might be described as an abnormal variety of the sex-impulse, but hardly as a morbid variety. If you like, it might be termed an arrest of development or a kind of reversion. And this is quite in accord with the fact that the best experts in the subject have so far not discovered more psychic abnormalities among homosexuals than among heterosexuals--nor more degeneracy or signs of degeneracy."--Consulting-Physician Dr. PAUL NAECKE, in _Der Tag_, 26th Oct., 1907.

"As a result of these considerations Ulrichs concludes that there is no real ground for the persecution of Urnings except such as may be found in the repugnance felt by the vast numerical majority for an insignificant minority. The majority encourages matrimony, condones seduction, sanctions prostitution, legalises divorce, in the interest of its own sexual proclivities. It makes temporary or permanent unions illegal for the minority whose inversion of instinct it abhors. And this persecution, in the popular mind at any rate, is justified, like many other inequitable acts of prejudice or ignorance, by theological assumptions and the so-called mandates of revelation."--"A Problem in Modern Ethics," p. 83.

"We understand by 'homosexual' a person who feels himself drawn to individuals of the same sex by feelings of real love. Whether or not he acts in accordance with this homosexual feeling is, from the scientific standpoint, beside the question. Just as there are normal folk who live chastely, so there are homosexual persons whose love bears a distinctly psychic, ideal and 'platonic' character….

"The feminine impress, in the case of homosexual men, is in general best indicated by the presence of greater sensitiveness and receptivity, also by the dominance of the emotional life, by a strong artistic sense, especially in the direction of music, often too by a tendency to mysticism, and by various inclinations and habits feminine in the good or less good sense of the word. This blending of temperament, however, does not make the homosexual as such a less worthy person. He is indeed not of the same nature as the heterosexual, but he is of equal worth."--Dr M. HIRSCHFELD'S evidence as medical specialist in the Moltké-Harden trial.

"One serious objection to recognising and tolerating sexual inversion has always been that it tends to check the population. This was a sound political and social argument in the time of Moses, when a small militant tribe needed to multiply to the full extent of its procreative capacity. It is by no means so valid in our age, when the habitable portions of the globe are rapidly becoming overcrowded. Moreover, we must bear in mind that society under the existing order sanctions female prostitution, whereby men and women, though normally procreative, are sterilized to an indefinite extent."--J. A. SYMONDS, "A Problem in Modern Ethics," p. 82.

"Before Justinian, both Constantine and Theodosius passed laws against sexual inversion, committing the offenders to 'avenging flames.' But these statutes were not rigidly enforced, and modern opinion on the subject may be said to flow from Justinian's legislation. Opinion, in matters of custom and manners, always follows law. Though Imperial edicts could not eradicate a passion which is inherent in human nature, they had the effect of stereotyping extreme punishments in all the codes of Christian nations, and of creating a permanent social antipathy."--_Ibid_, p. 13.

"Our modern attitude is sometimes traced back to the Jewish Law and its survival in St. Paul's opinion on this matter. But the Jewish Law itself had a foundation. Wherever the enlargement of the population becomes a strongly-felt social need--as it was among the Jews in their exaltation of family life, and as it was when the European populations were constituted--there homosexuality has been regarded as a crime, even punishable with death…. It was in the fourth century at Rome that the strong modern opposition to it was formulated in law. The Roman race had long been decaying; sexual perversions of all kinds flourished; the population was dwindling. At the same time Christianity with its Judaic-Pauline antagonism to homosexuality was rapidly spreading. The statesmen of the day, anxious to quicken the failing pulses of national life, utilised this powerful Christian feeling. Constantine, Theodosius, Valentinian, all passed laws against homosexuality--the last, at all events, ordaining as a penalty the _vindices flammæ_." HAVELOCK ELLIS, _op. cit._, p. 206.

"At the present time, shoemakers, who make shoes to measure, deal more rationally with individuals than our teachers and school-masters do, in their application to moral principles. The sexually intermediate forms of individuals are treated exactly as if they were good examples of the ideal male or female types. There is wanted an 'orthopædic' treatment of the soul, instead of the torture caused by the application of ready-made conventional shapes. The present system stamps out much that is original,

uproots much that is truly natural, and distorts much into artificial and unnatural forms."--O. WEININGER, "Sex and Character," ch. v.

"What is new in my view is that according to it homosexuality cannot be regarded as an atavism or as due to arrested embryonic development, or to incomplete differentiation of sex; it cannot be regarded as an anomaly of rare occurrence interpolating itself in customary complete separation of the sexes. Homosexuality is merely the sexual condition of those intermediate sexual forms that stretch from one ideal sexual condition to the other ideal sexual condition. In my view, all actual organisms have both homosexuality and heterosexuality."--O. WEININGER, "Sex and Character," ch. iv.

"How is it then that in our age reputed so philanthropic, whole classes of men, on account of inborn mental abnormalities, are marked down and banned, frantically persecuted, publicly branded, and threatened with the severest legal penalties? Any one would hardly believe what gross cases of justiciary murder, morally speaking, still take place in this matter even at the end of the nineteenth century. To the pitiful ignorance of the judges, to the thousand inherited prejudices of public opinion, as well as to the mental slavery of legislative bodies, must it be ascribed that the penal code of most civilised states is still in great measure formulated in the gloomy spirit of the Middle Ages."--O. de JOUX, "Die Enterbten des Liebesglückes," p. 16.

"Up till now homosexual humanity has found itself in a peculiar position. Its mouth was closed, it could not speak. It was bound hand and foot and could not move. But now there has come an important change. Science has taken the part of these folk and defended their honour … I protest therefore earnestly that these men, whether by means of the Law or any other means, should no longer be branded in the name of Christianity."--From a letter written by a Catholic priest in reply to a circular sent by the Humane-Science Committee of Berlin. (See "Jahrbuch der Sexuellen Zwischenstufen," vol. ii., p. 177.)

"Thus the very basest of all trades, that of _chantage_ [blackmailing] is encouraged by the law.… The miserable persecuted wretch, placed between the alternative of paying money down or of becoming socially impossible, losing a valued position, and seeing dishonour burst upon himself and family, pays; and still the more he pays the greedier becomes the vampire who sucks his life-blood, until at last there lies nothing else before him except total financial ruin or disgrace. Who will be astonished if the nerves of an individual in this position are not equal to the horrid strain? In some cases the nerves give way altogether.… Alter the law and instead of increasing vice you will diminish it. The temptation to ply a disgraceful profession with the object of extorting money would be removed."--"A Problem in Modern Ethics," pp. 56 and 86.

"You will rightly infer that it is difficult for me to say exactly how I regard (morally) the homosexual tendency. Of this much, however, I am certain that even if it were possible I would not exchange my inverted nature for a normal one. I suspect that the sexual emotions and even inverted ones have a more subtle significance than is generally attributed to them; but modern moralists either fight shy of transcendental interpretations or see none, and I am ignorant and unable to solve the mystery these feelings seem to imply."--HAVELOCK ELLIS, _op. cit._, p. 65, "case" ix.

"I cannot regard my sexual feelings as unnatural or abnormal, since they have disclosed themselves so perfectly naturally and spontaneously within me. All that I have read in books or heard spoken about the ordinary sexual love, its intensity and passion, life-long devotion, love at first sight, etc., seems to me to be easily matched by my own experiences in homosexual form; and with regard to the morality of this complex subject, my feeling is that it is the same as should prevail in love between man and woman, namely: that no bodily satisfaction should be sought at the cost of another person's distress or degradation. I am sure that this kind of love is, notwithstanding the physical difficulties that attend it, as deeply stirring and ennobling as the other kind, if not more so; and I think that for a perfect relationship the actual sex-gratifications (whatever they may be) probably hold a less important place in this love than in the other."--_Ibid_, "case" vii., p. 58.

"I grew older, I entered my professional studies, and I was very diligent with them. I lived in a great capital, I moved much in general society. I had a large and lively group of friends. But always, over and over, I realised that, in the kernel, at the very root and fibre of myself, there was the throb and glow, the ebb and the surge, the seeking as in a vain dream to realise again that passion of friendship which could so far transcend the cold modern idea of the tie; the Over-Friendship, the Love-Friendship of Hellas, which meant that between man and man could exist--the sexual-psychic love. That was still possible! I knew that now. I had read it in the verses or the prose of the Greek or Latin or Oriental authors who have written out every shade of its beauty or unloveliness, its worth or debasement--from Theokritos to Martial, or Abu-Nuwas, to Platen, Michel-Angelo, Shakespeare. I had learned it from the statues of sculptors--in those lines so often vivid with a merely physical male beauty--works which beget, which sprang from, the sense of it in a race. I had half-divined it in the music of a Beethoven and a Tschaikowsky before knowing facts in the life-stories of

either of them--or of an hundred other tone-autobiographists. And I had recognised what it all meant to most people to-day--from the disgust, scorn, and laughter of my fellow-men when such an emotion was hinted at."--_Imre: a memorandum_, by XAVIER MAYNE, p. 110. Naples, R. Rispoli, 1906.

"Presently, during that same winter, accident opened my eyes wider to myself. Since then, I have needed no further knowledge from the Tree of my Good and Evil. I met with a mass of serious studies, German, Italian, French, English, from the chief European specialists and theorists on the similisexual topic; many of them with quite other views than those of my well-meaning but far too conclusive Yankee doctor (who had recommended marriage as a cure). I learned of the much-discussed theories of 'secondary sexes' and 'intersexes.' I learned of the theories and facts of homosexualism, of the Uranian Love, of the Uranian race, of the 'Sex within a Sex.' … I came to know their enormous distribution all over the world to-day; and of the grave attention that European scientists and jurists have been devoting to problems concerned with homosexualism. I could pursue intelligently the growing efforts to set right the public mind as to so ineradicable and misunderstood a phase of humanity. I realised that I had always been a member of that hidden brotherhood and Sub-Sex, or Super-Sex. In wonder too I informed myself of its deep instinctive freemasonries--even to organised ones--in every social class, every land, and every civilisation."--_Ibid_, pp. 134, 135.

"Thus in sexual inversion we have what may be fairly called a 'sport' or variation, one of those organic aberrations which we see throughout living nature, in plants and in animals."… "All these organic variations which I have here mentioned to illustrate sexual inversion, are abnormalities. It is important that we should have a clear idea as to what abnormality is. Many people imagine that what is abnormal is necessarily diseased. That is not the case, unless we give the word disease an inconveniently and illegitimately wide extension. It is both inconvenient and inexact to speak of colour-blindness, criminality and genius as diseases in the same sense as we speak of scarlet fever, tuberculosis, or general paralysis as diseases."--HAVELOCK ELLIS, _op. cit._, p. 186.

"I have had for some time past a theory about this 'Homogenic' business--I do not suppose it is new--but it is that when man reaches a certain stage of development and approaches the totality of Human Nature, there gets to exist in him, though subordinately at first, a female element as well as a male. That is to say that as he passes the various barriers, he passes the barrier of sex too, on his way to become the complete Human--the Universal."--_From a private letter._

"Great geniuses, men like Goethe, Shakespeare, Shelley, Byron, Darwin, all had the feminine soul very strongly developed in them…. As we are continually meeting in cities women who are one-quarter, or one-eighth, or so on, _male_ … so there are in the Inner Self similar half-breeds, all adapting themselves to circumstances with perfect ease. The Greeks recognised that such a being could exist even in harmony with Nature, and so beautified and idealised it as Sappho."--CHARLES G. LELAND, "The Alternate Sex," pp. 41, and 57. London, 1904.

"I have considered and inquired into this question for many years; and it has long been my settled conviction that no breach of morality is involved in homosexual love; that, like every other passion, it tends, when duly understood and controlled by spiritual feeling, to the physical and moral health of the individual and the race, and that it is only its brutal perversions which are immoral. I have known many persons more or less the subjects of this passion, and I have found them a particularly high-minded, upright, refined, and (I must add) pure-minded class of men."--_Communicated by Professor ---- in Appendix to_ HAVELOCK ELLIS'S "Sexual Inversion," p. 240.

"What from the beginning struck me most, but now appears perfectly clear and indeed necessary is that among the homosexuals there is found the _most_ remarkable class of men, namely, those whom I call _supervirile_. These men stand by virtue of the special variation of their soul-material, just as much above Man, as the normal sex man does above Woman. Such an individual is able to bewitch men by his soul-aroma, as they--though passively--bewitch him. But as he always lives in men's society, and men, so to speak, sit at his feet, it comes about that such a supervirile often climbs the very highest steps of spiritual evolution, of social position, and of manly capacity. Hence it arises that the most famous names of the world and the history of culture stand rightly or wrongly on the list of homosexuals. Names like Alexander the Great, Socrates, Plato, Julius Cæsar, Michel Angelo, Charles XII. of Sweden, William of Orange, and so forth. Not only is this so, but it must be so. As certainly as a woman's hero remains a spiritually inferior man, must a man's hero--well _be_ a man's hero, if in any way he has the stuff for it.

"Consequently the German penal code, in stamping homosexuality as a crime, puts the highest blossoms of humanity on the proscription list."--Professor Dr. JAEGER, "Die Entdeckung der Seele," pp. 268, 269.

"The licentious or garrulous or morbid types of inverts have been so honoured with publicity that the other types are even yet little known. The latter, in the maturity of their intellectual and moral nature, cease to look upon sex as the pivot of the universe. They

cease to repine about their lot. They have their mission to fulfil here below, and they try to fulfil it as best they can. In the same way we find there are heterosexual (or normal) folk who at a certain stage of their growth free themselves from the sexual life.--M. A. RAFFALOVICH, “Uranisme et Unisexualité,” p. 74.

“The well-bred, highly-cultured Urning is a complete Idealist; matter is for him only a symbol of thought, and the actual only the living expression of the Invisible.”--DE JOUX, “Die Enterbten des Liebesglückes,” p. 46.

“As nature and social law are so cruel as to impose a severe celibacy on him his whole being is consequently of astonishing freshness and superb purity, and his manners of life modest as those of a saint--a thing which, in the case of a man in blooming health and moving about in the world, is certainly very unusual.”--_Ibid_, p. 41.

“If the soul of woman in its usual form represents a secret closed with seven seals, it is--when prisoned in the sturdy body of a man and fused with some of the motives of manhood, a far more enigmatic scripture of whose sibylline meaning one can never be really sure. Only the Urning can understand the Urning.”--_Ibid_, p. 63.

“Because they (Urnings) themselves are of a very complex nature and put together of opposing elements, they seek out and love the simple, plain, and straightforward natures. Because they continually suffer from the rebellion of their desires against good taste and morals, they often long for a barbaric freedom. And because their every emotion is cut short, distracted, and worn out by the thousand doubts and suspicions of their Urning-minds, they gather to themselves men who are wont to live straight from feeling to action, and who work from untamed masterly instincts, as sure as the animals.”--_Ibid_, p. 97.

“It is true that we are often inferior to normal men in force of will, worldly wisdom, and sense of duty; but on the other hand, in depth and delicacy of feeling and every virtue of the heart, we are far superior. We cannot _love_ women, but we lament with them, and help them on the hearth and by the cradle, in need and loneliness, as their most unselfish friends.… We do not despise women because they are weak, for we are much clearer-sighted, much less prejudiced than the so-called lords of creation, much nobler, more helpful, and just-minded than they.… Anyhow, if either of the sexes has cause to withhold its respect in any degree from the other--which has the most cause? Say what you will of them, the second and third sexes--women and Urnings--are ever so much better than the brutal egotistical Men, who to-day are plunged in grossest materialism; for, with whatever corruption, both the former are still of purer heart, easier kindled towards whatever is good, and more capable of genuine enthusiasm and love of their fellows, than the latter.”--_Ibid_, p. 204.

“Embodying as he does Love, Patience, Renunciation, Humility and Mildness, the Urning should seek to soothe with his gentle hand all hurts, and to heal all wounds, which are the results of weak Man’s original sinfulness. The tender emotions in his breast, his all too soft and easily troubled heart, his delicate sensitiveness and receptiveness of all that is lofty and pure, his mildness, goodness and inexhaustible patience--all these divine gifts of his soul point clearly to the conclusion that the great framer of the world meant to create in Urnings a noble priesthood, a race of Samaritans, a severely pure order of men, in order to offer a strong counterpoise to the immoral tendencies of the human race, which increase with its increasing culture.”--_Ibid_, p. 253.

“When I review the cases I have brought forward and the mental history of the inverted I have known, I am inclined to say that if we can enable an invert to be healthy, self-restrained and self-respecting, we have often done better than to convert him to the mere feeble simulacrum of a normal man. An appeal to the _paiderastia_ of the best Greek days, and the dignity, temperance, even chastity, which it involved, will sometimes find a ready response in the emotional enthusiastic nature of the congenital invert. The ‘manly’ love celebrated by Walt Whitman in ‘Leaves of Grass,’ although it may be of more doubtful value for general use, furnishes a wholesome and robust ideal to the invert who is insensitive to normal ideals. It is by some such method of self-treatment as this that most of the more highly intelligent men and women whose histories I have already briefly recorded have at last slowly and instinctively reached a condition of relative health and peace, physical and moral.”--HAVELOCK ELLIS, “Sexual Inversion,” p. 202.

“From America a lady writes:--‘Inverts should have the courage and independence to be themselves, and to demand an investigation. If one strives to live honourably, and considers the greatest good to the greatest number, it is not a crime nor a disgrace to be an invert. I do not need the law to defend me, neither do I desire to have any concessions made for me, nor do I ask my friends to sacrifice their ideals for me. I too have ideals which I shall always hold. All that I desire--and I claim it as my right--is the freedom to exercise this divine gift of loving, which is not a menace to society nor a disgrace to me. Let it once be understood that the average invert is not a moral degenerate nor a mental degenerate, but simply a man or a woman who is less highly specialised, less completely differentiated, than other men and women, and I believe the prejudice against them will disappear, and if they live uprightly they will surely win the esteem and consideration of all thoughtful people. I know what it is to be an invert--who

feels himself set apart from the rest of mankind--to find one human heart who trusts him and understands him, and I know how almost impossible this is, and will be, until the world is made aware of these facts."--_Ibid_, p. 213.

PREFACE.

The plan of arrangement used in this book has in view a combination of the recitation and lecture systems, and affords an opportunity for teachers to apply the best principles of both. The paragraph headings should be thoroughly fixed in mind and close attention should be given to the words in heavy type and Italics that occur in the body of a paragraph; together they form a convenient outline for the lesson. The questions at the end of each lesson are to be used to test the pupils' mastery of the lesson material; all available works of reference should be consulted for fuller information than the limited space of one book will admit of, each member of the class preparing one or more abstracts to be read before the class. The review outlines and suggestions are to be used in the same way, special attention being given to written answers such as would be required in an examination.

With a view of furnishing the reader a considerable amount of material on the _growth_ of music as an art, biographical sketches have been made short, especially since so many excellent works of that description are available at a small price. Emphasis has been laid on the work of the men who developed music, on the influences which shaped their careers and the permanent value of their contributions to music. A clear knowledge of how music reached its present state is not to be had by studying books, biographical and critical; the _works_ of the composers must be examined, played and sung, compared, analyzed as to methods of construction (Form) and expression (Melody, Harmony and Rhythm), so that the student may appreciate the change from simple, elementary processes to the free, polyphonic style found in the complex modern piano and orchestral scores. Reference is made to representative compositions by classical and modern composers, which are part of the average teaching repertoire. The works of the earlier composers are not, however, readily accessible, although good examples of the style of the 16th and 17th centuries are in the cheap editions of Peters, Litolff, Augener, Breitkopf and Härtel, and Ricordi.

The plan of this book provides for two lessons a week for thirty weeks. This will occupy a school year and allow time for quizzes, reviews and examinations. If more time is available, the work may be divided into four, five or six terms and stress laid on the study of representative compositions, the preparation of short papers on the suggested topics, adding, as a feature to interest friends and music lovers generally, public programs including music.

Musical clubs will find in this book material for several years' programs, special attention having been given to the lessons on modern composers and their music, the suggestions as to class-work applying with equal force to the study classes of clubs. The individual reader should follow out the suggested historical and biographical parallels which help so strongly to fix in the mind the periods in which composers lived.

Lessons III to VI were prepared by Dr. H. A. Clarke, of the University of Pennsylvania; Lessons VIII to XIV by Mr. Arthur L. Judson, of Denison University; Lessons XV and XVI by Mr. Preston Ware Orem, Mus. Bac., of Philadelphia; Lessons XVII to XIX, XXI to XXIII, XXXVII to XL by Mr. Frederic S. Law, of Philadelphia; Lessons XXV to XXXIII by Mr. Clarence G. Hamilton, A. M., of Wellesley College; Lessons XLI to XLVIII by Mr. Edward Burlingame Hill, A. B., of Boston; Lessons L to LVI by Mr. Arthur Elson, of Boston.

INDEX 561

INTRODUCTION.

=Purpose of the Study of the History of Music=.—The purpose of the study of the history of music is to trace the development of the many phases which make up modern music which we cannot but regard as a great social force, an intellectual, an uplifting force. If we consider it from the material side, it is one of magnitude; we need but think of the money invested in buildings, opera houses, schools, concert halls, publishing plants, factories, the sums spent on musical instruments, instruction, concerts, opera, etc., to recognize the commercial side. When we think of the great army of persons whose livelihood is conditioned upon musical work, upon the great audiences that support musical enterprises, we recognize the magnitude of music in a social sense, and that it offers a large field for study. These conditions, interesting as they are, represent only phases of musical work, not Music itself, and serve to show the place which Music occupies in the life of today. Our investigation is, then, a consideration of the origin and development of Music, and the means by which it took shape.

=The Place of Intellect in Music=.—When we think of Music we have in mind an organization of musical sounds into something definite, something by design, not by chance, the product of the working of the human mind with musical sounds and their effects upon the human sensibilities. So long as man accepted the various phenomena of musical sounds as isolated facts, there could be no art. But when he began to use them to minister to his pleasure and to study them and their effects, he began to form an art of music. The story of music is the record of a series of attempts on the part of man to make artistic use of the material which the ear accepts as capable of affording pleasure and as useful in expressing the innermost feelings. The raw material of music consists of the sounds considered musical, the human voice, various musical instruments and the use of this material in such ways as to affect the human sensibilities; that is, to make an impression upon the hearer which shall coincide with that of the original maker of the music who gives to his feelings expression in music. We find in music, as in other branches, that man tries to reduce phenomena to order and to definite form. The mass of musical material is vague, incoherent, disorganized. Man seeks to devise ways to use it intelligibly, and to promote esthetic pleasure. If musical sounds are to be combined simultaneously or successively, this combination should be in accordance with design, not haphazard, just as the builder of the house or the temple puts together his material according to a regular plan. Those who have been leaders in the Art of Music have labored in two ways: to _extend_ the limits of expression in music, and to find the means to _contain_ that expression. At one period stress is laid on making music expressive, at another on the medium for conveying expression to others, the latter being comprehended in the term Form. In connection with this statement, the student will do well to remember that every period of great intellectual activity, social or political, reacted upon music and the other arts; to illustrate, we need but refer to the formal, even artificial character of the music of the period preceding the French Revolution and the freedom and vigor imparted by the spirit of Romanticism which followed in the wake of that great political movement, a difference strikingly illustrated in the music of Haydn and Beethoven, Clementi and Schumann. There is also a constant action and reaction of the various racial streams of power such as the Aryan on the Semitic, East upon the West, Latin upon the Teuton, Folk-music upon the Scholastic.

=The Principles in Music=.—The leading principles in music are: Rhythm, Melody, Harmony, Color or Tone Quality, and in the execution of works of music, Dynamic Contrast, an essential factor in Expression. For ages after the birth of Music, Rhythm and Melody were the only real elements, Rhythm being first recognized. The potency of Rhythm, strong and irresistible in the early days of the race and with primitive man, is still acknowledged. Music that lacks a clearly-defined rhythm does not move the masses. Witness martial music, the dance airs and the “popular song.” All primitive languages were characterized by concise, figurative and picturesque qualities; they easily changed from the ordinary into the lofty and the impassioned. Intonation and changing inflection had much to do with meaning, as is the case with the Chinese language of today. Historians ascribe the origin of Melody to this principle of vocal expression. For years prior to the Christian Era, and long after, Rhythm and Melody were the only accepted elements of Music, and the art remained in a low grade of development. It was not until Harmony appeared, clear and unmistakable, that Music was able to claim a position equal to that accorded to the sister-arts, Poetry, Painting, Sculpture and Architecture. These principles, Rhythm, Melody and Harmony, became, when couched in the forms of expression adopted by the great masters, what we call Modern Music, and the story is one of a development from extreme simplicity to the complexity illustrated in modern orchestral scores.

=Means of Expression=.—One more phase must be mentioned here, the means used to present to others the thoughts or feelings of the composer, that is, the human voice and its artistic use, instruments of various kinds, their primitive forms and gradual development, their use singly and in combination with other instruments. This phase is peculiarly associated with modern music; for it was not until the art had freed itself from the fetters imposed by vocal music, that absolute music, availing itself of perfected instruments, came into its own. From that time development was unprecedentedly rapid.

=What is to be Brought Forward=.—The history of Music is, then, a recital of facts bearing upon the development of modern music and we shall lay stress on such facts as show a permanent impress and a solid contribution to progress in one or more of the lines marked out: Form, Expression, Melody, Rhythm, Harmony and Instrumental Color. In the study of a composer, the facts essential to the history of music are critical rather than biographical; not a life chronicle so much as a clear statement of what he specially contributed to forward the art. To gain an educational value, the facts of the history of music are to be studied so as to glean from them their significance, and an understanding of the causes and conditions which made them possible; then we go on to discern the consequences to which they in turn gave rise. No man works for himself and out of himself. He builds upon what others have done, and he builds for others. The student should discern the lesson in the past, and receive guidance for the future.

=What We Learn from Archæology=.—The history of an art such as Music must give the historical data in connection with the development of art and artists, free of all questionable and false features, and give as trustworthy, as accurate a picture of the various stages as possible. If we go backward in our research we reach a point at which ordinary records fail. If we make an inquiry into the beginnings of music we must have recourse to the findings and interpretations of Archæology. The results are by no means satisfactory. In all the digging in the ruins of the once great cities of Egypt, and Western Asia, and of Greece and Etruria as well, with perhaps one exception, no music has been brought to light, and but a few instruments, and these can scarcely be considered perfect. However, the pictorial representations on tombs, monuments, temples and houses give valuable aid, enabling scholars to reconstruct the story of music among the older civilizations. We must not forget, however, that conjecture plays a more or less prominent part in all the translations of the old hieroglyphic and cuneiform writings. We have no direct knowledge of the scales used or how the instruments were played together, what was the nature of the science and system in use. What we have is mere inference from the nature of the instruments and the representations of musicians playing their instruments, together with fragments from contemporary or later writings.

=What We Learn from Ethnology=.—Another source open to students of the beginnings of music is the material gathered by Ethnology. Those who place stress on this means of research lay down the proposition that the primitive people of the world of today occupy a mental and social stage similar to that of the primitive races from which the civilized folk of today have sprung. Therefore, they study the music, the rude chants, the dances, the instruments, etc., of various primitive tribes, and then by comparison try to indicate the various stages through which music came to have the art germ, from which the great product we know has developed.

=Some Theories=.—We can give in this lesson only a few of the theories offered by those who have discussed the matter of the origin of music: The Dance, Poetry and Music form a group which cannot readily be separated; they are not independent of each other, but most intimately connected. This view fails to take account of the fact that Music which is, externally, so closely connected with the Dance and with Poetry, is, in its essence, absolutely distinct. Schopenhauer, the philosopher from whom Richard Wagner drew inspiration, holds this view very strongly. He says: “Music is quite independent of the visible world, is absolutely ignorant of it, and could exist in a certain way if there were no world; which cannot be said of the other arts.” The other arts are essentially imitative and representative; they are based upon Nature. Some writers, the Frenchman Dubos and the English philosopher Herbert Spencer among them, claim that Music does represent Nature. They say that as the painter imitates the forms and colors he sees in nature, so the musician follows the various modulations of the voice, finding there the basic conceptions of Rhythm, Melody and Color. Singing, which Spencer considers the original music, is the emphasizing and intensifying of the properties of speech. Gurney says, _per contra_, that “Music creates audible forms, successions and combinations of tones which have no prototype in Nature and do not exist outside of Music.” Those who believe that Music is a separate entity therefore seek to trace it to a completely independent beginning.[1] Darwin offered another theory as to the way in which man arrived at Music. His idea is that the faculty of producing musical tones and rhythm was first acquired by our animal ancestors as a means of attracting the opposite sex, the faculty being developed and improved by the process of selection.

=The Conception of Fixed Scales=.—The question is sometimes raised: How did man reach the conception of fixed scales? Here again opinions differ. Some consider that the extreme notes were fixed by the average compass of the human voice in impassioned

speech, the interval being variously divided. Others claim that along with the vocal phase of music there was an instrumental side, and that the mechanical conditions in connection with instruments had bearing in the matter of organizing sounds into a scale; the rude, primitive trumpet of wood or bark, still found among forest tribes in South America and Africa, gives a series of harmonic notes. Whistles or flutes made in prehistoric times with a series of several tones, examples of combinations of little pipes, such as those known by the name of “Pan’s Pipes,” also bear on this question. Yet the facts are few and we are compelled to satisfy ourselves with mere conjecture.

QUESTIONS AND SUGGESTIONS.

Why do we consider music a force in civilization?

What do we mean by Expression in music?

The teacher will cite periods when “Expression” was the chief aim, when Form was.

Cite periods when intense political and intellectual upheaval reacted on music.

Give examples of the leading principles of Music.

What kind of facts are of importance to the history of Music?

What is the value of Archæology to the history of music?

Why is Ethnology valuable to the history of music?

Give several theories as to the origin of music.

Is the scale used by us the scale of all nations?

In preparing for recitation, students should get an outline of each lesson by the use of the paragraph headings and then work out the lesson by the use of the questions that follow. If the reference books suggested are available, additional reading should be done. A good plan is for the teacher to assign one or two paragraphs to a pupil and have the latter bring in such other information of interest as can be secured. Some questions may be grouped and pupils directed to prepare a short essay to be read before the class. In regard to dates, the suggestion is that pupils take turns, lesson by lesson, in presenting a plan by which to memorize them. When the period is one that can be related to some well-known event in general history, as the life of Charlemagne, the Norman Conquest of England, the Crusades, the Wars of the Roses, discovery of America, invention of printing, etc., it is well to do so; or make a well-known musician a contemporary of some artist, statesman, king, scientist, man of letters, etc. The teacher should be prepared in this manner for each lesson. Events before the Christian Era may be related to some event or character in Biblical history.

LESSON I.

MUSIC OF THE CHINESE, JAPANESE AND HINDOOS.

=Sources of Our Knowledge=.—When we study the music of the early period of the human race, we find no records such as we are storing today in our libraries. We must depend upon the discoveries of archæologists in the buried cities of early civilizations. Of contemporaneous books, properly speaking, tablets of music explaining the construction and methods of playing the musical instruments then in use we have few; if they exist they are in dead languages to which scholars are but slowly finding the key. It is true that some instruments have been found, but we can have no certainty that they are in perfect condition. The principal sources of the information we possess have been the paintings, decorations and sculptures on monuments and on the walls of buildings and tombs that have been unearthed. Early languages were largely pictorial, and records kept in this manner furnish us representations of the religious, martial, and social life of the early races.

=Countries with a Musical Past=.—The lands that offer the greatest field for the study of the music of the past are Chaldea or Babylonia and Egypt. Some of the old Greek cities, as well as cities in the western part of Asia Minor and Palestine, have been the subject of explorations. Still another country abounding in interest to the student of the music of the past is China, living, yet dead! What a contrast to Chaldea and Egypt! The civilization of the latter is dead; China, the older, is still living. These races had a common home, yet the former, having developed a high civilization and fulfilled its mission, disappeared from the face of the earth, while China, having also reached a high state of culture, has remained stagnant, all energies toward a higher level being arrested.

=The Common Home of the Race=.—Scientists place the cradle of the human race in the high plateau of Asia, extending from Persia eastward through Thibet and including part of Manchuria. The yellow race, according to some ethnologists, is the more akin to the primitive race; the other two, the white and the black, being derived from it by emigration, change of climate and mode of living. Van Aalst, the leading writer on Chinese Music, says that “the first invaders of China were a band of immigrants fighting their way among the aborigines and supposed to have come from the country south of the Caspian Sea.” It is outside the province of this work to detail the arguments that serve to show the connection of the Chinese with the other races mentioned. Berosus, the old Babylonian historian, writes: “There was originally in the land of Babylon a multitude of men of foreign race who had settled in Chaldea.” These men are known in history by the name of Akkads or Akkadians, “from the northern mountains,” Sumerians, from the “southern mountains”; that is, the highland ranges lying to the north and east of the Euphrates Valley. There were two main types among these tribes: a yellow, black-haired people, and a red type. The records show that migrations from this central home came about by reason of famines, plagues or floods. When did the black-haired, yellow people swarm off? When did the “red” people, from which Egyptian tradition claimed ancestry, go away? Probably the Chinese were the first to leave the central home, taking with them the elements of a considerable civilization, which also formed the basis of the later Chaldean, Babylonian, Assyrian and Egyptian cultures, and through various channels, of the Etrurian and Greek.

=High Place of Music Among the Chinese=.—The science of music had a high place in Chinese philosophy; the sages alone comprehend the canons, and the mandarins in music are considered superior to those in mathematics. Some most interesting dates are given, showing how early the Chinese had developed a science of music. We are told that in 2277 B. C., there were twenty-two writers on the dance and music, twenty-three on ancient music, twenty-four on playing the _Kin_ and the _Che_, and twenty-five on construction of scales. These facts imply many years of previous development before the time when works treating of the science of music would be prepared. Confucius, the chief Chinese philosopher, wrote about ancient music in 551 B. C. Unfortunately, ancient records and books were almost entirely destroyed, 246 B. C., by order of the Emperor then on the throne; he excepted from this destruction only works on medicine, agriculture and divination. A comparison of recorded dates shows that the Chinese were writing learned works on the science of music when the Pharaohs were building the pyramids.

=Sonorous Bodies=.—The Chinese have always shown a fondness for instituting likenesses between things in heaven and earth, and things intellectual and material. According to their theory, there are eight sound-giving bodies: Stone, Metal, Silk, Bamboo, Wood, Skin, Gourd and Clay.

=The Sheng=.—One of the most important musical instruments in use among the Chinese, one that is indispensable to their temple ritual, is the Sheng. This instrument is the representative of the =gourd= principle; originally the bowl was formed from a portion of a gourd or a calabash, the top being covered by a circular piece of wood with holes around the margin in which the pipes, seventeen in number, are fixed; in the side of the gourd is placed a mouthpiece or tube covered with ivory, through which the player _draws_ his breath. Each pipe is fitted with a small free reed of copper. A small hole is made in each pipe just above the bowl, which prevents a pipe from speaking when the air is drawn in by the player, unless the hole is closed by a finger. The instrument is placed to the mouth with the pipes slanting toward the right shoulder. The notes sounded by the pipes of the _Sheng_ as they are

arranged are:

[Music]

giving the following scale or series of sounds:

[Music]

four of the seventeen pipes are mutes, placed there doubtless for purposes of symmetry.

[Illustration: KIN. SE OR CHE. SHENG.]

=The Kin=.—The principle of the sound of =silk= is exemplified in the Kin or Ch'in, the strings, "made of twisted silk, being stretched over a wooden frame." This instrument was the favorite of Confucius, the great law-giver, and in _his_ time was of _great antiquity_. The number of strings was five, to agree with the five elements; the upper part was rounded, to represent the heavens; the bottom was flat, to represent the ground. The number of strings was later increased to seven, which is the favored form, tuned to G, A, C, D, E, G, A, a pentatonic scale.

=The Se=.—Another stringed instrument is the _Sê_, (also written _Che_), which had originally fifty strings. As now used, it has only twenty-five strings. Four kinds are in use, differing in size and in number of strings; it is customary that they should give the sound of two notes simultaneously, generally octaves. Some of these, used by the most skilful performers, have only thirteen or fourteen strings. The strings are plucked by two small ivory picks.

=Flutes=.—The sound of =bamboo= is exemplified in certain instruments of the flute family. The bamboo plant is used by the Chinese in very many ways; it is natural that they should use it for making musical instruments. There are two types of pipes or flutes: those blown at the end, as a whistle, and those blown across a hole near one end, as is our modern flute; the Chinese flutes are of the latter class. They varied in size and in the number of holes, from three to six, the little finger of each hand not being used. A popular flute, called the _Ti-Tzu_, has, in addition to the six finger holes, one for blowing and one covered with a thin membrane, to vary the sound. Another kind, very ancient, and much in use, according to Chinese writers during the period 2205-1122 B. C., may be called, shortly, the _Tche_. It has six finger holes, three near each end, and is pierced with another hole at the middle, across which the player blows. The scale is said to consist of six semitones, beginning with F, fifth line treble clef. The peculiar construction of this flute presents some acoustical problems.

[Illustration: TCHE.]

=Other sonorous bodies= are, =metal= from which the Chinese make gongs, bells and trumpets—they seem to have known the principle of the slide, as in the trombone, but never developed it; =stone=, certain varieties, in the shape of the letter L, pierced with a hole at the angle, suspended in a frame and struck by a hammer; =skin=, from which drums were made; =clay=, from which instruments were made in shape resembling the ocarina, familiar to us.

=Chinese Scales=.—The vocal and the instrumental music have different scales, the former _diatonic_—with two notes of the seven omitted, forming a _pentatonic_ (five-tone scale), the letters of which, since F is a favorite tonic, may be represented by F, G, A, C, D. The instrumental scales are _chromatic_ in character. When the voice is accompanied by instruments, the vocal scale is used. Singing is in unison, modified by fourths, occasionally. The singing tone is a sort of nasal sing-song, the favorite method a nasal falsetto, the mouth being nearly closed.

[Music]

This represents the concluding strophes of the Hymn to Confucius. The time is very slow; each measure represents a line of four syllables; between the lines one of the instruments gives a sort of interlude.

So much space has been taken with Chinese music because the conservatism of that race has preserved instruments and music that date back to the early history of our race.

[Illustration: KOTO.]

=Japanese Music=.—In the Japanese system we find a _pentatonic_ scale and a _semitonal_ division of the octave. Japanese music does not proceed in semitones, the chromatic scale being demanded by the custom of transposing a melody from one starting point to another, not more than fourteen sounds for a melody. A favorite Japanese instrument is of the clarinet type; it is

called the _Hichi-riki_; in length it varies from a little less than nine inches to a little more. The scale as set forth by the Institute of Tokio is from G, second line, treble staff to the A above, F, fifth line, being sharped. This instrument is played by _drawing_ in the breath. The Japanese have an instrument called the _Sho_, similar to the Chinese _Sheng_. The national instrument is the _Koto_, which has thirteen strings, tuned thus: the first, middle C sharp, the second, F sharp a fifth lower; subsequent strings ascend in order, G sharp, A, C sharp, D, F sharp, G sharp, A, C sharp, D, F sharp, G sharp; between the fourth and fifth sounds is a third, which interval, in practice, was filled by pressing the string behind the bridge, thus increasing the tension; each string can be raised a semitone or even a tone by increasing the pressure. By this means additional notes can be secured, giving a scale identical with the Greek Dorian or ecclesiastical Aeolian. Much of the popular Japanese music is written without the extra notes, and the series of tones can be characterized as a pentatonic scale based on the natural minor. Thus:

[Music]

=The Hindoos=.—Among the Asiatic races that still retain national, although not a separate political existence, and have a musical system peculiar to themselves, the Hindoos are prominent. The Hindoos belong to the Aryan race, (from which we also sprang), and had their home originally in Central Asia, probably north of the Hindoo Koosh range. When they swarmed off from the old home they made their way down through the mountains along the river valleys to the great fertile plains of India, and conquering the aboriginal races, developed the system of caste, which has had so great an influence on their religion, literature, science and art. The old Hindoo literature shows clearly the high regard in which the art of song was held. Celebrated minstrels were maintained in the royal courts whose duty it was to chant songs in praise of their patrons. Music, or song, was just as indispensable in the religious ceremonies. One of the holy books makes the statement that “Indra rejects the offering made without music.” In time the singer became a member of the priestly caste.

[Illustration: VINA. RAVANASTRON.]

=The Vina=.—From antiquity to the present time among the Hindoos pure instrumental music held almost equal place with song or accompanied vocal music. The Hindoo instruments belong to the percussion types, trumpets and trombones, nose flute, and especially to the stringed class. It is noteworthy that the simpler kinds, in which each string gives but one tone, do not exist, whereas there are many varieties of those which have fingerboards. The oldest and most important is the Vina, which consists of a wooden pipe about four feet long attached to two gourds or resonators. The seven metal strings are stretched over nineteen bridges or frets, becoming gradually higher, and touch only the last and highest one. The other eighteen serve to fix the pitch of the tone desired, as in our guitar or mandolin, the strings being set in vibration by being plucked with a metal thimble or ring like that used by zither players. Another Hindoo instrument, considered by some as the prototype of stringed instruments played with a bow, is the Ravanastron.

=Hindoo Musical Philosophy=.—Hindoo myths ascribe a divine origin to music. A close connection was established between the scale and their religious ideas. Each single tone was under the protection of a nymph, and the first syllables of the names of these nymphs, according to Clement, the French historian, were given to the tones, thus: Sa, Ri, Ga, Ma, Pa, Da, Ni, seven in all, differing in that respect from the _pentatonic_ form _usually_ found among the early races. In their endeavor to satisfy the melody of speech, the inflections of the voice in speaking, the Hindoos divided the interval of the octave into small parts, and transposed the scale freely up and down; so it is easily conceivable that their complete system recognized 960 scales, their sacred writings speaking of 16,000. In practice they contented themselves with 36, some writers say 72. The following is given as the scale:

[Music]

The principal feature of Hindoo music is the melody and rhythm, the latter being very complicated. Of harmony in our sense of the word there is no sign. In accompanying the voice the Hindoos used only the pure fifth, which they considered a perfect consonance, the fourth, an imperfect consonance, and the octave.

=High Esteem of Music Among the Hindoos=.—Music had a high place among the Hindoos, all festivities made use of it, and the private and social life demanded it. It was used freely in the Hindoo drama, the latter calling for the dance, spoken and sung dialogue and instrumental music and songs. The main reason why Hindoo music did not develop in the past centuries doubtless lies in the fact that, as in Egypt, the ruling power was vested in the priesthood, which controlled all the arts and sciences. Music was so interwoven with their religious rites and observances, and so hedged around with irrevocable and sacred laws that the slightest alteration was considered a sacrilege. In closing this section it may be added that investigators refer the gipsies, particularly those of Hungary, who are noted for their musical temperament, to Hindoo origin, probably the pariah caste. Their music, with its wild,

free rhythm and elaborate melodic embellishment, has a marked resemblance to the music of the Hindoos.

QUESTIONS.

What is the source of our information as to the beginnings of music?

What countries are being explored by archæologists?

Where was the cradle of the human race?

Which branch was probably the first to "swarm off"?

How ancient are some Chinese records concerning music?

What are the sound-giving bodies according to Chinese theories?

Give an example of each kind.

Describe the _Sheng_, _Kin_, _Che_ and _Tche_.

What kind of scale is used in Chinese vocal music?

What is the Japanese national instrument?

What kinds of instruments did the Hindoos have? Their favorite instrument? Describe the latter.

Tell about the Hindoo scale.

Why did music among the Hindoos fail to develop?

LESSON II.

MUSIC OF THE BABYLONIANS, EGYPTIANS AND HEBREWS.

=History a Record of Change=.—History is a record of changing conditions. Nations rise into prominence and fall again; cities are built to be torn down by conquerors; even the face of the earth has changed since the days when the scions of the Aryan race began to leave their home in Central Asia. Arms of the sea have shrunk to rivers, rivers to shallow streams, the desert sands have encroached on the once fertile valleys, and choked the springs and brooks of the meadows. Geologists tell us that the great valleys were made by the alluvial deposit washed down from the hills and mountains by the streams. The Chinese followed the course of the great rivers that made toward the eastern seas, the Hindoos toward the southern ocean, and still another "swarm" followed the great rivers Euphrates and Tigris, which came from the mountains of Western Asia. The great valley lying between the desert and the mountains, a scene of waste and ruin as far back as the time of ancient Greece and Rome, was once a most important centre of population and wealth, the home for centuries of races that had reached a high degree of culture in the arts and sciences, and the seat of what may be considered the oldest of extinct civilizations. The valley was wonderfully fertile, was brought to a high degree of cultivation and supported an enormous population. As an instance of the physical changes that have taken place in this region, it may be mentioned that about 4000 B. C., the Tigris and the Euphrates entered the sea by different mouths, instead of joining as now and in the days of Abraham, the patriarch, who came from this region, and the town identified by modern scholars as "Ur of the Chaldees," which is now 150 miles up the Euphrates, was an important seaport.

=The Chaldeans=.—When the Aryans came down into this valley they found already established there a people whose records are now being unearthed, called Akkads, belonging to the Mongolian family, who had reached a high degree of cultivation in art and science. The records found show that music was an important branch of study; at a very early date the harp, pipe and cymbals are mentioned, and we infer that the people were fond of singing, since many sacred hymns have been recorded in tablets. This race, joined to others, founded the Chaldean kingdom, the capital being Babylon. In the 12th century B. C., a king of Assyria, in the northern part of the Tigris valley, conquered Babylon and thus gained the ascendancy.

=The Practice of Music Among the Babylonians=.—In the great ruins now being excavated, tablets of clay have been found which give a vivid idea of the social and religious esteem in which music was held by the Babylonians. One of these tablets, said to date back more than three thousand years B. C., contains a representation of musicians. One strikes with a hammer upon a metal plate, another carries a reed pipe, a third plays upon a harp of eleven strings, while two others beat time or give the accent by clapping their hands. Especially rich in sculpture is the palace of Sennacherib. One of the relief decorations shows a festival procession in honor of the returning conqueror. In front walk five men, three with harps, a fourth with a kind of lyre, whose strings were struck with a plectrum; the fifth bears a double flute. Two of the harpers and the lyre player dance. Then follow six women, of whom four carry harps, one blows a double flute, while the last beats a sort of drum. Following the instrumentalists come six women and six children singing, who indicate the rhythm by clapping their hands. From the fact that in these sculptures a few soldiers indicate an army, we infer that the Babylonians made use of large bodies of players and singers in their great ceremonies. These tablets indicate that the Babylonians made much use of trumpets to give signals to the armies and when great masses of the people were gathered together. That musicians were highly esteemed we judge from the fact that on one occasion Sennacherib spared the lives of musicians among his captives, all others being put to death. Since the Chaldeans, especially, were famous as astronomers and mathematicians, it is thought that they, like the Egyptian sages, had knowledge of the mathematical relations of the various intervals.

[Illustration: ASSYRIAN HARP (SAMBUCA). SANTIR.]

=Chaldean Instruments=.—Two instruments seem to be especially noticeable: the Symphonia and Sambuca. The former was carried to Palestine by the Hebrews, at the end of their captivity, and, according to their accounts, seems to have been a sort of bagpipe, an instrument particularly suited to a pastoral people like the early Chaldeans. As to the Sambuca we have no authentic knowledge; it seems, however, to have been an instrument of the zither type, held horizontally and played with a plectrum.[2] A stringed instrument, struck with a hammer, called the Santir is credited to the Assyrians.

=Egyptian Music=.—When the great Alexandrian Library of 495,000 works of Persian, Chaldean, Hebrew, Egyptian, Greek and Roman literature was partly destroyed during Julius Cæsar's battles with the native Egyptians, in 47 B. C., and finally, A. D. 391, by Christian fanatics, history suffered an irreparable loss. Treasures of learning in all branches, the records of early civilizations perished, never to be replaced. Today we are dependent upon the discoveries of explorers in the ruins of the great Egyptian cities, temples, tombs and pyramids. The Egyptians believed that articles of necessity to the living being were necessary to the individual in a future existence. If certain things could not, in reality, be placed in the tomb, a pictorial representation would have almost equal value in the invisible world. In Egyptian tombs pipes or "flutes" have been found, and in one instance, in the tomb of a musician, the bronze cymbals he played when alive. In the various tombs and ruins that have been examined by explorers, pictorial representations of practically every phase of Egyptian life have been found. The sources for our knowledge, almost wholly inferential, are, then, the various pictorial and sculptured representations of the Egyptian musical instruments and the manner in which they were used, and a few fragments of their sacred books, which were forty-two in number, two being devoted to music, although but one fragment has been found. It must be noted, further, that the Egyptian Government, although nominally a monarchy, limited, not absolute, was in reality theocratic. The priestly caste had final power, and the rules and regulations drawn up by them prescribed the minutest detail of life, crushing all possibility of independent thought and freedom of action, a condition fatal to high artistic development.

=Place of Music in Egyptian Life=.—To show the place of music in Egyptian life, the following from Ambros' history will serve admirably: "From these decorations [on the walls of tombs] we perceive that the Egyptians made great use of music. We find harps of many sizes and shapes, small and easily portable, to others beyond the height of a man, crude and of the utmost simplicity, to others elaborate and extremely rich in decoration. We note an almost endless variety of =lyres=, =guitars= and =mandolins= [that is, similar in type to the instruments we know by these names], single and double flutes, played by hands of numerous musicians, together with male and female singers. Music was used to accompany the dance, the funeral cortège,[3] the banquet and other social functions. Inscriptions show that there were musicians of high social position at the court."

=Egyptian Instruments=.—The records show a development of music from a crude simplicity in early days to a brilliant and complex system alongside of the changes in other arts and the sciences, some of the discoveries going as far back as 1625 B. C. We give illustrations of several forms of the Egyptian =harps=. The number of strings varied from three or four to twenty-one. Mr. J. F. Rowbotham, the English historian of music, says that “taking B below the bass staff as the lowest note of the Egyptian scale, (since it likely followed the Assyrian in this respect) the compass of the great harp would extend to E, first line, treble staff. The small harps of various sizes had a compass from D, third line, bass staff, to D or E above the treble staff. Another series of stringed instruments, known under the general name, lyres, had the same compass as the small harps; the lutes had a low G, (bass) string, and the highest note was C or D on the treble staff; various forms of the flutes had about the same compass; pipes, [which may be represented by the flageolet of today] had a compass of about one octave upward from E, fourth space, treble clef. Other instruments were of the percussion character, =tambourines=, =drums=, =cymbals=, etc. Although the Egyptians used their instruments in combination, there is reason to believe their practice was the alternation of groups, only occasionally using all simultaneously, to secure fulness and power of tone.”

[Illustration: HORIZONTAL HARP. SMALL HARP. GREAT HARP.]

=Philosophy and Practice of Egyptian Music=.—The consensus of opinion is that Egyptian music was melodic in character, the instruments or voices playing or singing in different octaves, rejecting other intervals. As the Greeks seem to have drawn from the Egyptians much of their practice in music, it is reasonable to suppose that they would have used harmony if the Egyptians had been accustomed to make use of it. As to the Egyptian theory of music we have no information. Since, however, Pythagoras, the Greek philosopher, was a student of the Egyptian school for priests, we infer that his teachings were founded on the science he acquired there; hence it is probable that the Egyptians were familiar with a seven-fold division of the octave and the mathematical relations of the fourth and fifth, as well as other intervals of the scale. Of the old Egyptian hymns we have no remains unless it be, as some assert, that fragments still exist among the Coptic Christians.

[Illustration: TRANSVERSE FLUTE. DOUBLE FLUTE.]

=The Hebrews=.—What a wonderful history is that of the Hebrews! It has seen nation after nation rise to power and go down. It has been enslaved, seemingly beyond all possibility of recovering a national existence, yet regained place. Egypt, Assyria, Persia, Rome, held the Hebrews, yet the latter are still with us, as a distinct race, while their conquerors have but pages of history. A glance at the history of the race will show that they touched the sources of early civilization. Abraham was a resident, according to the Bible story, of Ur in the land of the Chaldees, where a considerable civilization had been attained. From here he went to Canaan, thence to Egypt, and back again to the country east of the Red Sea. When his descendants went to Egypt they must have carried with them Syrian music and instruments, doubtless preserving a trace of Chaldean influence. It was during the four centuries’ sojourn in Egypt that the Hebrews, though for a time enslaved, gained the proportions of a nation. As their duties placed them in close relations to their masters, they gained considerable of the Egyptian science, literature, customs, etc. At that time, musicians were slaves, and tradition says that Miriam, the sister of Moses, was a slave dancing-girl and singer. We know that Moses was instructed in the learning of the Egyptian priesthood, and in that capacity officiated in some of the functions of the temple services. Such facts as these go far to justify the idea that the Hebrews gained their fundamental notions of music and musical instruments during their long sojourn in Egypt. Some writers claim that the songs of the Hebrews were adapted to Egyptian chants. The pastoral life led by the descendants of Abraham, the period of slavery which the Hebrews suffered in Egypt, and the subsequent migratory life in the wilderness were not adapted to develop a people’s song. The life in Palestine for many years was a strenuous one; and then came another period of slavery among the Assyrians, by which the Hebrew ideas were again modified.

=A Religious People=.—The Hebrews were an intensely religious people, the code delivered to them by Moses fixing the status of music up to the time of the pleasure-loving Solomon. Their music, in distinction from that of the nations around them, was not sensuous but a true _musica sacra_, in this respect more a matter of religion than of art. During the reign of David, the Levites were organized as the singers for the Temple services. Music and poetry were the chief subjects of instruction. David himself composed many of the tunes to which his Psalms were sung.

=Hebrew Poetry and Its Relation to Their Music=.—The key to the music of the Hebrews is their poetry. They grew to numbers under the most adverse circumstances, and developed a temperament indifferent to environment and elevated to high spiritual aspiration, making them an intensely religious people, whose life was little softened by artistic practice. The effect of the injunction against the making of “graven images,” as given them in the code of Moses, was to cut them off from the exercise of the esthetic faculty in sculpture or painting; their unsettled mode of life prevented outlet in architecture. So they poured out the whole strength of

their passionate, powerful natures in poetry and song. The most striking characteristic of the Hebrew poetry is the parallelism of the phrases, each sentence or complete thought being made up of two similar or contrasted thoughts, and the accompanying music must have had the same character. The following from the Psalms shows this feature:

“Lord, hear my voice: let thine ears be attentive to the voice of my supplication.” “I will not give sleep to my eyes, or slumber to mine eyelids.”

When the great choirs of men singers were organized for the Temple services, this parallelism brought about the division into two bodies, who sang alternately, a practice in use today in certain churches with ritualistic services, and known as antiphonal singing.

=Hebrew Music=.—It is unfortunate that we have no reason to believe that the hymns in use in the Jewish synagogues today are sung to the tunes of thousands of years ago, even if modified. In the various countries of Europe, Spain, Italy, Germany, Russia, the airs are quite different, suggesting that tradition has failed to deliver anything that can traced to the days of the poet-king of Israel. Some authorities find in the Gregorian chants traces of Hebrew melodies which came down from the early Christians of Jewish birth and training. Clement of Alexandria says that their songs were earnest and dignified; there must have been some special character in them as shown by the command of the Babylonians, “Sing us the songs of Zion.” The principal relation that the Hebrews have to the history of music arises from the enduring impress the works of the Psalmist and other portions of the Scriptures have made upon the music of the Christian Church.

=Hebrew Instruments=.—The Hebrews borrowed their instruments from other nations, principally from the Egyptians, the one most favored being a form of the =harp=, small enough to be portable, used to give effect to the chanting of the prophets. “To prophesy meant to sing,” and it is quite likely that Isaiah, Jeremiah and the other inspired poets uttered their thoughts in verse and song, both being extemporized.

The student should bear in mind that the various musical instruments mentioned in the Bible must be understood as types. The harp of David was not the same as our harp, the organ was not like our great church instruments, viols, sackbuts, cornets, pipes, psalteries, etc., are names given by the translators to the Hebrew terms used in the Bible. They used words with which they were familiar, and which they thought corresponded in type to the instruments used by the Hebrews.

QUESTIONS.

What great river valley was the home of the Chaldeans?

What do we know of music among the Akkads?

What evidence have we to show that the Assyrians held music in high esteem?

What instruments did they use?

How do we learn of the ideas of the Egyptians in regard to music?

Who controlled the knowledge of music and other sciences and arts? Was this beneficial to music?

What instruments did the Egyptians use?

What was the character of Egyptian music?

What was the origin of the Hebrew race?

What influences did they come under in Egypt?

What difference was there between the music of the Hebrews and that of the nations around them?

Why did they express themselves in poetry and music?

What was a leading characteristic of their poetry?

Have any ancient Hebrew melodies been preserved?

What musical instruments did the Hebrews have? What was the origin of these instruments?

LESSON III.

MUSIC OF THE GREEKS: SCALES.

When we think of Greece, it is Athens, the centre of Greek art and culture, that comes to mind. An ancient city, Athens, as history teaches us. The record is that it was founded by Cecrops, who brought a colony from Egypt, in 1556 B. C., a period when Egypt was a centre of power, wealth, education and science. Therefore we infer that these colonists brought with them to Greece the ordinary, popular music and instruments to which they had become accustomed in their home. But there was an older Greece; for late discoveries show that there were five cities, each built upon the ruins of an older city, the first one going back to 2500 B. C. These earlier inhabitants, themselves an offshoot of the great Aryan race, were absorbed by the colonists.

=Music and Myth in Greece=.—The beginnings of music in Greece are mingled with myths: Pan, Apollo, Mercury, Athene and others appear as the patrons and exemplars of the musical art. Aside from the names of the mythical gods and goddesses, there are names of human beings that stand out with clearness. These early musicians were singers or bards who chanted the songs composed in honor of chiefs and tribal heroes. Such were Hyagnis, 1506 B. C., Marsyas, his son, and Olympus the elder, Orpheus, Musæus (1426 B. C.), chief of the Eleusinian mysteries, Linus, Amphion, Thaletes, whose songs were favorites of Pythagoras; the greatest of these bards was the blind Homer, to whom the date 900 B. C. is assigned. “By the Greeks, music as an art was considered an aid in regulating by rule the inflections of the voice, to mark the places of emphasis, and to define the pauses in the recitation of their epic poetry; and the rhythm of their songs followed strictly laws that had been laid down; innovation was reprehended, and even prohibited.”[4]

=Early Greek Musicians and Writers=.—The earliest musician’s name met with in the annals of music is that of =Terpander= (676 B. C), who is said to have increased the number of strings on the lyre from four to seven. Next in order was =Pythagoras= (585-505 B. C.), who added an eighth string to the lyre. He was called the discoverer of the Tetrachord, which is still known by this name, the inventor or discoverer of the Octave Scale, also the discoverer of the ratios of the consonances; but there is no doubt that he learned all these things during his sojourn in Egypt. He is also credited with the invention of the Canon or Monochord with movable bridges, a contrivance still in use for investigating the ratios of intervals. Unfortunately none of the writings—if any ever existed—of Pythagoras have come down to us. Our knowledge of his theories is second-hand, gathered from the writings of his disciples. Pythagoras seems to have studied sound more in the manner of the acoustician than of the musician; hence his followers, or rather those who called themselves by his name, were more concerned with the ratios of sounds than with their musical effects.

Among the great philosophers who treated on music, =Aristotle= (384 B. C.) holds an important place. We find his theories expressed in one of his works called “Problems.” A pupil of his—=Aristoxenus= (350-320 B. C.), has left the most valuable treatise on music, of any of the ancients, the oldest musical work known at the present time; it is, unfortunately, not complete. Aristoxenus was a practical, in addition to being a theoretical musician; he thought that the ear was the final court of appeal in matters musical. Hence the musical world was divided into two factions: the Pythagoreans, who held that music was purely a matter for arithmetical investigation, and the Aristoxenians, who claimed that the chief end of music was to be listened to. This dispute lasted for many centuries. =Boethius=, the Roman philosopher, in his writings takes sides with the Pythagoreans and pours contempt on the mere musician. The successors of the Pythagoreans are even yet not extinct, as every now and again some wiseacre turns up with a scheme to secure just intonation, at the price of losing all that music has gained under our present system. =Plato= (430 B. C.), the greatest of philosophers, has much to say about music; but these sayings are largely incomprehensible to modern understandings.

=Euclid= (323 B. C.), the great mathematician, treated largely of music.[5] =Aristides Quintilianus= was another author of great weight. =Plutarch=, in his _Symposia_, has one devoted to music, but unfortunately the meaning of these authors is often so obscure that it cannot now be discovered. Alexandria, in Egypt, came into prominence in music when the great library was founded there by Alexander the Great, in 332 B. C. =Eratosthenes= (276-196 B. C.), the librarian, figures in the mathematics of music. When we reach the Christian Era, we meet with two more writers, =Didymus= (A. D. 60), who introduced the “minor”[6] tone into the scale, and =Claudius Ptolemy= (A. D. 130).

=The Music of Ancient Greece the Foundation of Modern European Music=.—Although the history of European music properly begins with the music of Ancient Greece, we are still very ignorant of the subject, owing to the fact that there is not in existence a note of music anterior to the Christian Era. But lately, in the ancient treasure house at Delphi, a hymn was found inscribed in marble on the inner wall. Mr. J. P. Mahaffy, an authority in matters pertaining to Greek literature, says: “The time is given by the metre, a long syllable and three short, variously placed, or two long and a short between them, in every case 5-8 in a measure.... As regards the accompaniment or harmonizing of the air, there is none extant. [As to the melody] although there is rhythm and even a recurrence of phrases to mark the close of the period, nothing worthy of being called melody in any modern sense is to be found.” The inscription dates from the third century before Christ, is a hymn to Apollo and the Muses, and consists of phrases equal to eighty measures in our modern reckoning. The blank spaces in the measure were filled in by an instrument, probably the cithara. Our knowledge is confined to the treatises of mathematicians and musicians, previously mentioned, and these works are often so obscure that there is much uncertainty as to their meaning. Besides, these writings are scattered over a period of about 800 years; that is, from 585 B. C., the date of Pythagoras, to 130 A. D., the date of Claudius Ptolemy. Numberless changes took place in the art in the course of this long period; hence the attempt to elucidate a homogeneous system by comparing these writings is about as hopeless as would be the attempt to deduce the modern system of music from the collocation of the works of Guido and Hucbald of the 10th century with those of Richter and Prout in the 19th.

[Illustration: Music HYMN TO APOLLO AND THE MUSES.]

We owe much to the labors of these bygone writers; in fact, the Greek system of music is the foundation upon which the modern system is the superstructure. No attempt will be made here to settle the many disputed points that have puzzled the learned for ten or more centuries, but a clear and concise account of all that is necessary to an understanding of the place of this system in the historical development of music will be given.

=Formation of the Greek Scale=.—The Greek Scale was founded on a tetrachord or succession of four sounds, arranged as follows:

E (half tone) F (whole tone) G (whole tone) A

It is commonly believed that these letters written on the bass staff, thus:

[Music]

represent the exact pitch, as near as may be, of this tetrachord. In early times the lyre was tuned to these four sounds, and was called the _Tetrachordon_; that is, four strings. This gracefully shaped instrument has remained to this day the symbol of music. This limited scale was extended by adding another tetrachord, which began with the last note of the first tetrachord, thus:

A—B■ C D E—F G A

making a scale of seven sounds, called the scale of _Conjunct_ or _Joined Tetrachords_; also from its seven strings, the Heptachord scale. The next step was to take in the limit of the octave. The first way adopted was to raise the highest string a whole tone, thus making it the octave of the lowest; the sixth string was also raised a whole tone to make it a whole tone below the seventh. The result was a scale of seven sounds with one degree omitted, thus:

A—B■ (C) D E E—F G A

The next form was:

E—F G A B (C) D E

It will be seen that in this scale the second tetrachord begins a whole tone above the first, instead of beginning with the final of the first. It is therefore called the scale of _Disjunct_ or _Separated Tetrachords_. The missing sound (C) is here added and the octave

scale is complete. When the lyre had seven strings, the middle string, that is, the fourth, counting from either end, was called _Mese_, which means “middle”; but this word soon gained a secondary meaning which, in time, became the most important, viz.: _Keynote_.

=The Lesser Perfect System=.—There was in use at the same time a scale called the _Lesser Perfect System_, which was made from the conjunct seven-note scale by adding another conjunct tetrachord below, thus:

A—B■ C D E—F G A (A) B—C D E

Then A was added below the first tetrachord to make an octave with the note _Mese_. This A was the lowest sound admitted in the Greek System. It was the Romans who gave to this series of sounds the first seven letters of the alphabet, which they still retain. This octave (A to A) is also the origin of our natural minor scale. This Lesser System was the scale used in the Temple rites. It continued to be used for this purpose long after the system about to be described was invented.

=The Greater Perfect System=.—This was made from the disjunct octave by adding a conjunct tetrachord below and one above, thus:

E—F G A E—F G A B—C D E (A) B—C D E

The A below was also added, thus making a scale two octaves in extent. In later times the disjunct tetrachord, B—C—D—E, was added at the top. This E was the highest note admitted in the Greek System; consequently, their music never exceeded the limits of two octaves and a fifth, and the sounds included in these systems were as follows:

[Music: Greater Perfect System without B■

Added Note Lesser Perfect System without B■]

Peculiar interest attaches to this series of sounds, because in the Middle Ages they were supposed to be the _only_ sounds admitted by the Greeks. This accounts for the fact that B was the first note that it was considered right to use in two forms.

=The Greek Scales=.—The Greeks did not by any means confine themselves to these sounds, but changed the pitch of the starting note just as we do with our scales; in other words, both of these systems might be transposed. Therefore they not only had all the sounds at command that we have, but as their scales were (theoretically, at least) tuned acoustically true, they had a great many more. But their scales were all diatonic (the scales they called Chromatic and Enharmonic will be explained later), they were all like our natural minor. When they said “Dorian Scale” they meant just what we mean when we say scale of D minor; Phrygian Scale meant E minor; Lydian Scale, F-sharp minor; Mixo-Lydian, G minor. In addition to these four scales there were three that began a fourth below, one a fourth below the Dorian, called the Hypo-Dorian, A minor; a fourth below the Phrygian, called the Hypo-Phrygian, B minor; and a fourth below the Lydian, called Hypo-Lydian, C-sharp minor; these were the standard scales of Greek music. These names, Dorian, etc., were retained in the Ecclesiastical System, but the mistake was made of supposing that the Greeks used only the fixed sounds given by the untransposed Greater System. Hence the Church Dorian has B natural, not B-flat; the Church Phrygian, F natural, not F sharp; and the Church Lydian begins on F natural, instead of on F sharp. Hence, no two church scales are alike in the positions of the halftones.

QUESTIONS AND SUGGESTIONS.

Name some of the myths connected with music among the Greeks. Consult a work on mythology.

Name the musicians and philosophers connected with Greek music; arrange them in chronological order, with dates.

State the successive points of development.

Why do we consider that the history of music as we know it today begins with Greek music?

Have we music that belongs to the Greek period?

On what was the Greek Scale founded?

How was this extended? What name did this form receive?

In what respect did the Disjunct form differ from the Conjunct?

What was the _Mese_?

What was the Lesser Perfect System?

What was the Greater Perfect System?

What was the highest note used by the Greeks? What was the lowest?

Were these systems transposable?

What is the meaning of the prefix “Hypo”?

LESSON IV.

MUSIC OF THE GREEKS (_Concluded_).

=The Greek Octave System=.—So far, everything is clear enough; but the next step is not quite so sure. The Greeks spoke of the Dorian Octave, the Phrygian Octave, and so on; and the word Octave, used in this way, has been thought to be synonymous with Scale, which is doubtful, for the following reasons:

The standard instrument of the Greeks was the octave lyre. The lowest and highest strings were tuned respectively A, fifth line bass staff, and A, second space, treble.

[Music:

Dorian Octave. Signature B■ Phrygian Octave. Signature F■

Lydian Octave. Signature F, C and G sharps. Mizo-Lydian Octave. Signature B and E flats.

Hypo-Dorian Octave. Hypo-Phrygian Octave. Signature F and C sharps.

Hypo-Lydian Octave. Signature F, C, G & D sharps.]

These were fixed sounds, but the tuning of the remaining six strings _might be changed_ at will; therefore, a series of sounds belonging to any one of these scales could be made; and it will be seen, on examining the following table, that all the seven scales may be represented _without changing the extreme notes_, A to A. Suppose we make the B flat. Now B-flat is the characteristic note of the Dorian Scale, in our term, its signature. Therefore this octave would be called the Dorian Octave, _not_ Dorian Scale. We speak of a scale as beginning and ending on its _keynote_; if it does not, we call it a scale passage in such and such a key.

The notes marked + are the keynotes (_Mese_). It will be seen at once that the positions of the halftones differ in _each_ of these octaves. One cannot help feeling a slight suspicion that some confusion between scale and octave had a great deal to do with the growth of the Ecclesiastical Scales.

One of the latest of the ancient writers on music, =Claudius Ptolemy= (about 130 A. D.), proposed that all these octaves should be transposed a _fourth lower_; this made the Dorian Octave E to E (all naturals). One result of this change is that many authorities at the present time call this the Dorian Scale, whereas it is evident that it is simply the Dorian Octave, as given above, transposed a _fourth lower_. Other scales were added from time to time, called _Hyper_-Dorian, _Hyper_-Phrygian, etc., a _fourth above_ the standard scales; but it is very uncertain whether they were in practical use; they were probably purely matters of theory.

=Characteristics Attributed to the Different Greek Scales=.—The Greeks attributed many fanciful characteristics to the various modes or scales, much as some modern musicians, Berlioz, for example, do to the different keys. But all seem to have agreed as to the Dorian. This was considered the true Greek mode, and was called severe, firm and manly, suitable for martial songs. The Lydian mode was esteemed to be effeminate, suited to love songs, possibly because the Lydian Octave corresponds with the scale of A major, and a major scale was not relished by the Greeks, any more than it was by the early ecclesiastical musicians. A more probable explanation of this attribution of different characters to the different scales is, that it was customary to use certain modes for songs on certain subjects, and the character of the poetry was transferred to the music.

=The Greek Chromatic Scale= differed altogether from what _we_ call a chromatic scale. It was made by _lowering_ the pitch of the _fourth_ and _seventh_ strings above the _keynote_ a halftone. Supposing the octave lyre to be tuned to the Hypo-Dorian

Mode or Scale, it would begin and end on the Keynote (_Mese_), thus:

[Music]

Now, by lowering D and G we get the following scale:

[Music]

This is the scale that was called Chromatic. It is said to have been at one time the most popular of all the scales, a statement we can easily credit, since it contains in itself the two world-wide five-note or _Pentatonic_ Scales, commonly known as the Scotch or Irish Scales, the most widely distributed of all scales in Europe, Asia and America.

[Music: Major pentatonic scale Minor pentatonic scale]

=The Greek Enharmonic Scale=.—The scale called Enharmonic was made thus: The fourth and seventh strings were lowered a whole tone; that is, to the pitch of the second and sixth, the second and sixth were lowered a _quartertone_, thus:

[Music]

C-flat is supposed to be halfway between B and C; F-flat halfway between E and F. Our modern system does not provide for the notation of quartertones.

[Illustration: LYRE. CITHARA. LYDIAN MAGADIS.]

=Greek Instruments=.—The standard instrument of the Greeks was the =Lyre=. It bore many names, as Lyre, Tetrachordon, Chelys, Phorminx, Cithara, etc. There may have been slight _differences_ in the _size and the number of the strings_, but great uncertainty prevails on this point. Under the name of =Flute= (_Aulos_) they seem to have included both _Flutes_ proper and instruments of the _hautboy_ or _clarinet_ family. These instruments bore a bewildering number of names, the exact meaning of which is lost. Judging from the pictorial representations that remain, the Greek instruments were inferior both in variety and extent to those of the Egyptians. They seem to have made little use of the Harp, of which instrument the Egyptians had a great variety. The Greeks seem to have used instruments chiefly, if not solely, to accompany the voice; and they appear never to have combined large numbers of instruments for any purpose. Even in their tragedies, which were performed in immense theatres open to the sky, the Chorus was limited to fifteen men, accompanied by two flutes. When accompanying the voice with the lyre they may have occasionally struck the fourth, fifth or octave of the vocal melody; but, in general, they played the voice part. Their most highly developed instrument was a variety of lyre, the strings of which passed over a bridge placed one-third of the strings' length from the lower end of the lyre, thus causing the lower part of the string to sound the octave of the upper part. The shorter part of the string was played with a plectrum in the right hand, the longer part by the fingers of the left hand. This instrument was called =Magadis=—from _Magas_, a bridge. The term _Magadize_ was eventually used to signify playing or singing in octaves, and was _synonymous_ with _Antiphony_.

[Illustration: DOUBLE FLUTE. JOINED FLUTE. PHORBEIA.]

=Greek Musical Notation=.—Our knowledge of Greek musical notation is very defective, being derived from only four or five specimens of ancient music, and a few small fragments. They appear to have used a _separate notation for each mode_, and these four hymns are apparently all in the same mode, but authorities differ as to the mode. They used the letters of their alphabet, both capital and small, written in various positions, sometimes upright, sometimes lying on one side. The notation for the lyre differed from that used for the voice. The letters representing the _vocal_ part were written _above the words_, those representing the _instrumental_ part, _below_ the _words_. These _letters represented_ the _pitch_ of the sounds, but _not_ their _duration_. The duration was regulated by the _meter_ of the poetry. Instead of a portion of one of these hymns, the first three lines of our National Hymn are given as a sample of this notation:

R R Φ Γ R Φ σ σ P σ Φ R Φ R Γ R My country 'tis of thee, Sweet land of liberty, Of thee I sing.

These letters have been interpreted as indicating the following sounds, the transposed Hypo-Lydian Scale in its old form; that is, the Lesser Perfect System with G sharp as its keynote.

[Music]

=Greek View of Harmony=.—The question has been much debated as to whether or not the Greeks practiced harmony. It seems hardly possible with such a defective notation; but the best argument against it is, that there is not a word in any of the extant treatises as to combinations and successions of these combinations, and it is impossible that any art of harmony should have existed unless some rules for its employment should have been evolved.

=Greek Terms in Music=.—The modern terminology of music is largely indebted to the Greek system, although many of the words have entirely changed their significance. The word Music itself, to the Greek, meant the whole circle of the sciences, especially Astronomy and Mathematics. Melody meant the rising and falling of the voice in either speaking or singing. Harmonia meant rather what we call Melody than our Harmony. This latter, namely, the sounding together of different sounds, was called Symphony. Antiphony originally meant singing in octaves, that is, men with women or boys. Chromatic and Enharmonic have already been explained. Diapason, now applied chiefly to organ stops, originally meant the octave; that is, “through all.” Diatonic has nearly retained its original meaning. Tone, Semitone and Tetrachord have retained their meaning, with the exception that in the modern tetrachord the halftone is at the other end.

QUESTIONS AND SUGGESTIONS.

What was the Greek use of the term Octave; “Dorian Octave,” for example?

What change did Claudius Ptolemy suggest? What confusion resulted?

What is the meaning of the prefix “Hyper”?

Explain the Greek Chromatic Scale.

Explain the Greek Enharmonic Scale.

What was the standard Greek musical instrument? What names were given to modifications of it?

What instruments were comprehended under the term _Aulos_?

How were the instruments used in accompanying the voice?

What is meant by “magadizing”?

Give an account of Greek musical notation.

Did the Greeks use “Harmony” as we understand that term?

Name some musical terms that come from the Greek. Berlioz gives the characters of different keys in his book on Instrumentation. “Auld Lang Syne” is a pentatonic melody, scale of F, with fourth and seventh omitted. Any series of five notes on the black keys of the piano will make a pentatonic scale, major character. The language of music was determined by scholars, hence the use of so many terms with Greek and Latin roots.

LESSON V.

ECCLESIASTICAL SYSTEM.

=Rome the New Centre=.—The Power that rules in the affairs of men seems to have made provision for the elevation of the whole race by diffusing at intervals of centuries, the treasures of art, science and thought accumulated by a nation of unusual power and energy. Egypt dominated the northern part of Africa, the shores of the Mediterranean and the western slopes of Asia Minor, and in course of time yielded to the advance of the Greeks, but leaving behind, as a legacy, much that has had enduring value. What had once been centred in one nation, under the control of one caste, the priests, was spread through much of the known world. Greece,

in turn, shaped the destinies of expanding civilization. In the Greek social life free art played a great part; wherever the Greeks went as merchants and colonists, they carried with them the principles of Greek art, including music. Greek musicians were accounted stars of the first magnitude in Egypt, in the Greek colonies of Italy, and later in Rome, which, after the fall of Greece as a political factor, became the political, social and artistic centre of the world; through her conquests and subsequent colonizing diffusing throughout a larger world than Egypt and Greece knew, an increased wealth of thought and action which greatly influenced later generations.

=Rome Dependent Upon Greece=.—The Romans did not show a native instinct for art. Their national qualities were essentially warlike, and were developed by years of struggle for existence. A people whose organized life was political and martial, and for so long found expression first in defence, later in conquest, would not develop a true art life. As they grew stronger they built up their collections by pillage and by purchase; they were taught music, oratory, architecture, sculpture by Greeks who sought the capital of the world. Roman nobles imitated Greek customs, learned the Greek language and literature, cultivated music according to Greek methods, used Greek instruments, such as the cithara, lyre and flute, sang Greek songs and formed companies of singers and players to furnish entertainment at their feasts and at the public spectacles. The Roman drama was modified by Greek principles, and Greek actors replaced Roman artists; the pantomime was borrowed from Egypt. Music was a favorite distraction in the high ranks of Roman society, and men known to history were skilful players or singers—Sylla, Flaccus, Calpurnius Piso, Titus, Caligula, Hadrian, and, best known of all, Nero.

[Illustration: ROMAN HORN. SYRINX.]

=Growth of Christianity=.—While the Roman Empire, in its turn, had served the purpose of the Ruling Power in the affairs of men, in secret a new force was gaining strength, one that was soon to drive pagan arts and pleasures from open cultivation. In the Catacombs, in remote sections of the great city, pursued, hunted like beasts, martyrized, the Christians clung to their faith with its simple rites of worship, in which the singing of songs was a marked feature. Whence these songs came is by no means certain, the prevailing opinion being that they were of Greek origin, modified by Hebrew influence.[7] In the course of years songs were introduced in the Christian service with no other warrant than that of tradition. During the years of persecution no systematic cultivation of music was possible. Later, when Constantine accepted the Cross, 325 A. D., and Christianity had triumphed over Paganism, the abuses became such that the ecclesiastical authorities set themselves to the task of reform and of establishing a system of song for the use of the Church.

[Music: Tonus Peregrinus as a chant]

=Origin of the Church Scales=.—It is absolutely unknown when or by whom the system of scales, known as the Church Scales, was invented. The latest writer on the Greek System was =Claudius Ptolemy= (about 130 A. D.). In 330, =Pope Sylvester= established a school for training church singers, but we have no information as to the system he employed. The name of =Ambrose=, Bishop of Milan (333-397), has for centuries been associated with what are called the _Authentic_ Scales, but there is no valid evidence whatever that he had anything to do with their adoption. The name of =Pope Gregory= (540-604) has also been associated with another set of scales called _Plagal_, with as little authority as in the previous case. There does not appear to have existed any system of notation in the time of Ambrose or Gregory. The Greek notation by letters was forgotten, and the very insufficient system of notation by Neumes had not been invented. The only writer of any authority after Ptolemy was Boethius, and he did more to confuse the subject of music than to explain it.

=Foundation of the Church Scales=.—But if we know nothing of the inventor of the Church Scales, or of the way in which they grew into their final form, we are, nevertheless, perfectly well informed of the fully-developed system which, it must be remarked, grew out of a misunderstanding of the Greek Scales. The Church Scales were founded on the Greater Perfect System of the Greeks, with this restriction, namely, that it was _not transposable_; whereas, we have seen that the various Greek modes were transpositions of either the Lesser or Greater Systems.

[Music]

This is the series of sounds from which the Church Scales were made. None of them might be _altered_ by sharp or flat, _except_ the _B_ in the second octave (and this was a later addition which was probably owing to a remembrance of the Lesser Perfect System in which the B was flat.) The Greek names were retained for the Church Scales, but as not one of the notes was inflected, it follows that the _halftones_ occur in _different_ places in every scale. The scales to which these names were given were called Authentic, those with the prefix _Hypo_ were called Plagal. In the table on the next page, the Greek and Church Scales, also the

Greek _octaves_ are given side by side.

=Confusion Between the Systems=.—We may gather from this table how the confusion between Dorian and Phrygian has arisen. The Phrygian Octave is identical with the Church Dorian, and the Dorian Octave with the Church Phrygian. A proof that the Church Scales originated in the way indicated may be found in the fact that the Church and Greek Hypo-Dorian Scales are identical, this being the only Greek Scale without a sharp or flat. The Church Hypo-Lydian was also called the Ionian Scale; its arrangement of tones and semitones is the _same_ as that of the _modern major scale_. It was not considered appropriate for church music, being looked upon as soft, effeminate and lascivious, by both Greeks and mediæval churchmen.

Hypo-Dorian Octave Hypo-Dorian Hypo-Dorian

Mixo-Lydian Octave Hypo-Phrygian Hypo-Phrygian

Lydian Octave Hypo-Lydian Hypo-Lydian

Phrygian Octave Hypo-Mixo-Lydian]

=Eight Modes in Use=.—The Church Scales were numbered from one to eight; the Authentic Scales were given the odd, and the Plagal Scales the even numbers, thus:

1. Dorian 2. Hypo-Dorian related scales. 3. Phrygian 4. Hypo-Phrygian related scales. 5. Lydian 6. Hypo-Lydian related scales. 7. Mixo-Lydian 8. Hypo-Mixo-Lydian related scales.

A melody in an Authentic Scale had to end on its Keynote, but a melody in a Plagal Scale ended on the Keynote of its _related_ Authentic Scale. Observe that the Dorian and Hypo-Mixo-Lydian Scales are identical; but while the former had to end on the Keynote, D, the latter ended on G, which is the fourth of its scale, and Keynote of its _related_ Authentic Scale.

Traces of these Authentic and Plagal Scales may be found in many old folk-songs. Thus, the melody of the “Last Rose of Summer” begins on the Keynote, rises in the course of the melody to the octave, but ends by falling to the Keynote; it is therefore Authentic. On the other hand, the melody of “Robin Adair” begins on the fourth _below_ the Keynote, rises to its octave, but ends on the fourth _above_ its initial note and is Plagal; thus:

[Music: Range Range

Initial Final Initial Final

LAST ROSE OF SUMMER. ROBIN ADAIR.]

The term _Hyper_ (above) was sometimes applied to the Authentic Scales. In the Greek System the _Hyper_ Scales were the same distance _above_ the standard scales that the _Hypo_ Scales were _below_. Although twelve modes were theoretically admitted in church music, it was for the most part confined to the eight modes given above.

=The Dominant=.—In addition to the keynote there was another note in every scale of almost equal importance, called the _Dominant_. This name has been retained in the modern system, but with a total _change_ of meaning. In the Church Scales it meant the _Reciting Note_, that is, the note on which the principal part of the words was chanted. In all the _Authentic_ Scales but the Phrygian, the _fifth_ of the scale is the _Dominant_; in the _Phrygian_ the _sixth_ is the _Dominant_, because the B was a changeable note, that is, might be natural or flat. The _Dominants_ of the _Plagal_ Scales are a _third below_ the Dominants of the

related Authentic Scales, except in the Hypo-Mixo-Lydian, in which the Dominant is a second below that of its related Authentic Scale. Therefore the _Dominant_ is the _sixth_ of all the _Hypo_ Scales, but the _Hypo-Phrygian_ and _Hypo-Mixo-Lydian_, in which it is the _seventh_.

=Hucbald's Scale=.—Two attempts were made in the 10th century to construct new scales, first by =Hucbald=, who founded his series of sounds on a tetrachord, in which the halftone was between the second and third, thus: A B C D. His object seems to have been to obtain a series in which a succession of perfect fourths and fifths might be secured, for which purpose he made use of the following series of sounds:

[Music]

In the first tetrachord B was flat, in the third natural; in the fourth, F was sharp. As to the use made of this scale, little or nothing is known.

=Guido's Scale=.—The other attempt, usually attributed to _Guido_, a contemporary of Hucbald, resulted in the _Hexachord_ Scale (six-note scale). This scale was formed by adding a whole tone above and below the Hucbald tetrachord, thus: G, A, B, C, D, E. To complete the series of Hexachord Scales, another sound was added, namely: the G below the A on which the Greek scales and their derivatives, the Church scales, began. The first seven letters of the Roman alphabet were used to name the sounds already in use, hence to indicate this sound the Greek letter, Gamma, was adopted. At the same time the syllables _ut_—_re_—_mi_—_fa_—_sol_—_la_ were used to name the sounds of every hexachord (precisely as the movable Do is used now); hence this lowest sound was called _Gamma-ut_, corrupted into Gamut. The sounds in the series were indicated by placing after the letter the syllables that indicated its position in all the hexachords in which it was found, thus:

G A B—C D E C D E—F G A

1. _Gamma—ut_. 2. _A—re_. 3. _B—mi_. 4. _C—Fa—ut_, because C is _fa_ in the first, and _ut_ in the second hexachord. Consequently, to a mediæval musician, _C—fa—ut_ meant what we would call C, second space bass clef.

The following table gives all the Hexachord Scales with the names of the sounds. It is of interest because this system of nomenclature persisted long after the one which gave rise to it was obsolete.

{ E la { D la sol Super { C sol fa Acute { B■ mi { B■ fa { A la mi re

{ G sol re ut { F fa ut { E la mi Acute { D la sol re Octave { C sol fa ut { B■ mi { B■ fa { A la mi re

{ G sol re ut { F fa ut { E la mi Grave { D sol re Octave { C fa ut { B mi { A re { Γ ut

The Hexachords in which the B was flat were called Soft (_Mollis_); those in which B was natural, Hard (_Dura_); the term _mollis_ has been retained in the French word _Bemol_, a flat, and in the German name for a minor key, _Moll_. The word _dura_ (hard) is also retained in the German as a name for the major key _Dur_. When the letters were used as a means of notation, the sound B-flat was indicated by the old form of the letter b, which has been retained as the sign for a flat. This was called B _rotundum_ (round B); when B natural was wanted, a stroke was put on the right side of the ■, called B _quadratum_ (squared B), the sign to this day for a natural.

QUESTIONS AND SUGGESTIONS.

What city became the centre of life after Athens and Greece fell?

What new influence was shaping in the Roman Empire?

When did music receive official attention and reform?

What names are associated with the early history of Church Music?

On which Greek system were the Church Scales founded?

What difference exists between the Greek and the Church Scales as to the positions of the halftones?

What is meant by Authentic and Plagal?

What were the rules in regard to a melody in the Authentic forms? What Plagal? Give an example of each.

What is meant by Dominant? Was the position of the Dominant the same in each scale? Name some variations.

What attempts were made to construct new scales?

What is meant by “Gamut”?

What is meant by C—fa—ut?

What names were given to the different forms of the Hexachord? What are the modern meanings of the terms?

What is the origin of the flat and natural signs?

Note the points of similarity and difference in the three scale forms on page 65 in this lesson. As an exercise take well-known airs to see if they are Authentic or Plagal. In the “Taming of the Shrew,” by Shakespeare, is a passage in which reference is made to the names of the notes as found in this lesson. Read this passage in class.

LESSON VI.

NOTATION.

=System of Notation by Letters=.—The earliest system of Notation, attributed to =Boethius=, the Roman philosopher, seems to have been the placing of letters over the syllables, thus:

C C D B C D My country ’tis of thee.

[Music: Boethius’ Notation]

During the period of history dominated by Pope Gregory the Great, a change was made in this system by which capital letters, small letters and double letters were used, an improvement, since only the first seven letters of the alphabet were employed, thus:

[Music]

This system seems to have been used chiefly for theoretic demonstration. These two methods indicated the _pitch_ sufficiently, but _not_ the _duration_ of the sounds.

=Neumes=.—The next attempt was somewhat of a retrogression instead of an improvement. Signs called _Neumes_ were placed over the words. These signs consisted of points, lines, accents, hooks, curves, angles and a number of other characters placed more or less exactly over the syllables to which they were intended to be sung, in such manner as to show, relatively, by the distance above the text, how much the voice was to rise or fall. They did _not_ indicate _absolute pitch_ or _duration_. The number of characters in use, according to manuscripts still preserved, varied from seven to forty. In later forms they appear in the notation used for the old Plain Song melodies (Gregorian) which were recalled into general use by Pope Pius X, in 1904.

Lettres.

gfg ef hi g g fd f de de c d gh efg f d c dd.

Notation du treizième siècle.

Notation moderne.]

=Parallel Lines=.—Another plan was to use a variable number of _lines_, writing the syllables in the spaces, thus:

[Illustration]

This clumsy contrivance indicated _relative_ pitch well enough, but _not_ the _key_—or the duration. The next step was to use lines—which varied in number—upon or between which the Neumes, which gradually changed to square notes, were written. The pitch was indicated by using a _red_ line for F, and a _yellow_ or _green_ line for C. A further improvement was, to put the letters F or C and later G on one of the lines at the beginning; the modern clefs are simply modifications of these letters.

=Characters to Indicate Duration=.—The honor of suggesting characters to indicate _duration_ is usually attributed to =Franco of Cologne=, an ecclesiastic who lived in the latter part of the 12th century; but as in the case of Gregory and Guido, we must believe that his name simply stands as representative of a period. A system is rarely the work of one man, rather a development from the labor of many. Franco's treatise on the subject marked an epoch. Up to the end of the 13th century the notes in use were the Longa, Brevis, and Semibrevis, as well as the Duplex Longa, or Maxima. The smaller values, the Minima, and the Semiminima first occur about 1300. About the middle of the 15th century white notes were introduced in place of certain of the black, the latter color being reserved only for the smaller note values. The signs underwent some change at this time. Maxima, Longa, Brevis, Semibrevis (our whole note), Minima (half note), Semiminima (quarter), Fusa (eighth), Semifusa (sixteenth).

[Illustration: Longa Brevis Semibrevis Duplex Longa or Maxima Minima Semiminima]

[Illustration: Maxima Longa Brevis Semibrevis Minima Semiminima Fusa Semifusa]

=The Beginnings of Harmony=.—Our information as to the beginning of Harmony is very vague and uncertain. As early as the Saxon times in England some rude kind of part singing, without written rules apparently, seems to have existed. The first intimations we have of any scientific attempts are _Faburden_ or _Falsoborden_ and Diaphony or Organum. Faburden consisted of singing a melody while another voice sang a _drone_ accompaniment below it; thus:

[Music]

Diaphony or Organum consisted of a succession of _fourths_ or _fifths_ and _octaves_, thus:

[Music: Two Parts Three Parts]

It has been denied by some authorities that such a barbarous manner of singing ever existed; but two considerations have been lost sight of, in making this denial: First, the fourth, fifth and octave were esteemed the _only consonances_. Secondly, the undisputed fact that as late as the time of Chaucer, if not later, what was called "discanting quatible" or "quinable" existed; this discanting was done as follows: The performer while singing a melody accompanied himself on the lute, playing the _same melody a fourth or fifth above_. It can hardly be doubted that a style of performance that was esteemed in the 15th, was perfectly satisfactory to the ears of the 10th century.

=Discant=.—Another early attempt at harmonic effect was the singing of an _extemporaneous_ part or parts with the melody, called Discanting. In course of time the Discant or Organum gradually crystallized into rules, and other intervals were accepted. Strangely enough, dissonances seem to have been admitted with great freedom, and thirds and especially sixths, were avoided. The only dissonance that was _not_ allowed was the _minor second_.

=The New Organum=.—In the 11th century, a method of combining sounds, called the New Organum, was developed. This kind of Organum admitted thirds and sixths. The following example will sufficiently illustrate this:

[Music]

=Measured Music=.—The next step in advance, and one that proved very important and far-reaching in its results on the development of music, was the invention of a notation that indicated, although not very conveniently, the _relative duration_ of sounds. Thus it became possible to express two or more parts in a permanent form. The plan of this first attempt at a notation by

means of which relative duration of notes might be expressed was very complicated. Music written with these signs was called Measured Music (_Cantus Mensurabilis_).

=The Record of Early Harmony=.—There are references to the manner of using voices in combination in the writings of several men associated with the Christian Church in its early days. =Censorinus=, who lived in the 3d century, makes mention of a practice of using a melody in octaves accompanied by the fifth to the lower note of the octave, which is also the fourth to the upper. =Cassiodorus=, in the 6th century, mentions various ways of accompanying the chant with consecutive fourths and fifths. In a work called “Sentences About Music,” written by =Bishop Isidore of Seville=, who lived in the 7th century, we read that “harmony is a modulation of the voice, the concordance of many sounds and their agreement.” In the 9th century we meet with the names of several writers: =Remi d’Auxerre= who defines harmony as “a consonance of voices, and their union in one group”; =Jean Scot Erigene= who recognized that the succession of chords composed of octaves, fifths and fourths is a rational one; =Odo= or =Otger=, a churchman of the south of France, whose work was the first to mark an epoch in the development of the art of music. Also another monk, the Fleming =Hucbald=, who lived in the 10th century. They defined consonance and dissonance, and appear to have been the first to give rules for the construction of Diaphony. Hucbald says in his “_Musica Enchiriadis_”: “Certain dissimilar sounds sung together make an agreeable effect, and this mingling of voices is sweet to the ear.”

Their immediate successor, =Guido=, has been credited, unjustly, with being the inventor of nearly every improvement in the art up to his time. The old organum closed with his. The earliest writer who treats of the new organum is =John Cotton=, in the 11th century. He was the first to promulgate the rule that contrary motion is always to be preferred to similar or oblique. He says: “At least two singers are required in diaphony formed from different sounds. While one voice sings a melody, the other surrounds it with different tones, and at the end of the phrases the two voices unite at the unison or octave.” The fullest development of the new organum was attained in the works of =Guy de Chalis=, about the close of the 12th century. He gives examples in which we find intervals of the eleventh and twelfth, a demonstration of the existence of a system differing from the Gregorian, which does not exceed the octave. In the same epoch, =Denis Lewts=, of Liége, a Carthusian monk, gives rules to fix the use of accidental signs, a flat to lower B, a sharp to raise F. He speaks of these as if they had been in use for a long time, and indicated that the idea was to avoid the occurrence of the diminished fifth or the _augmented fourth_, known in harmony as the _tritone_. This process is called _Musica Ficta_, and formed a part of the instruction of singers. The examples cited by Lewts conform to this theory, and show that although in the songs, motets and other compositions of the period the sharps and flats are not found, it is because musicians knew the principles and made the application for themselves. Instruction in those days was chiefly oral, a method which placed a premium on a retentive memory. By the time that the 13th century was reached, musical forms and melodies were widely spread, and as we look back to the 9th century it is possible to note the gradual development. Harmony always existed, in a limited sense; but it did not take on a scientific development until the Middle Ages. It is to the musicians of this latter period, from the 13th to the 15th centuries, that we must give the honor of having taken the germ of a science of harmony and of having brought it forward to mature development.

Williams.—The Story of Notation.

QUESTIONS.

Explain the earliest system of notation used for the Church scales. What was the next improvement?

State the defects.

What was the system of Notation by Neumes? Did they indicate absolute or relative pitch?

Give the successive steps making use of lines.

What was the origin of our Clef signs?

Who is credited with introducing signs to indicate Duration?

Name the signs adopted. Compare them to the notes now in use.

Explain Faburden; Diaphony; Organum; Discant; Measured Music.

Who were the early writers on the subject of music?

LESSON VII.

MUSIC OUTSIDE THE CHURCH.

Up to this, our study of music in the Christian Era has traced the development of the art as fostered by the Christian Church, and mainly among the people of Southern Europe, in whom there was a strong admixture of the Latin blood and spirit. Before going farther on this line we will look into the record of music among the races of Northern Europe.

=Music of the Gauls=.—Roman writers give us some account of the character of the music of the Gauls, which differed much from the Greco-Latin songs. Roman historians make mention of the songs of the Gallic bards, who were poets and musicians as well, composing both religious hymns and songs in honor of their heroes. According to Diodorus of Sicily, the Gauls practiced the musical art long before the Christian Era, having regular schools for the instruction of the younger bards. The instrument used in accompanying their songs was a sort of lyre, judging from representations on some gold medals made in the time of Julius Cæsar. Charlemagne ordered a collection of the early Gallic songs to be made, but the work has not survived.

=The Celtic Bards=.—The Breton bards made use of an instrument the name of which is variously spelled Crouth, Crowd, Chrotta, Crwth, played with a bow, with an opening in the upper part through which the performer placed the left hand in order to press the strings, the number of which varied from three to six. The crouth of the Welsh bards differed in some respects from those that were made use of by the Breton bards. With them, however, a form of the harp became the national instrument. The early history of Celtic music in Wales in particular, is mingled with myth. We have only the names of bards, Fingal, Fergus and Ossian, no authentic music. What is of importance to us is the secular organization of the bards. One class included poets, historians and those skilled in the science of heraldry; another class comprehended musical bards, harp players bearing the title of doctors of music, players of the six stringed crouth and singers, who must have been skilled men, since nine years' study was exacted of them.

[Illustration: BRETON CROUTH. LYRE (9TH CENT).]

[Illustration: IRISH HARP. ENGLISH HARP.]

=Ireland=.—The traditionary bard of Ireland is Fergus, whose songs were of war and heroes. When St. Patrick introduced Christianity into Ireland in the 5th century, learning and skill in the arts of poetry and music grew to be cultivated as extensively as in more favored lands. In the 10th century, the famous musician was the King O'Brien Boru, whose harp is still shown in the Dublin Museum. This has twenty-eight strings, and the sounding board, in which there are four holes, is very large at the base. After Ireland was conquered by the English its culture declined, owing to continuous wars and internal strife.

=Scotland=.—The music of the Scotch, like the other Celtic races just mentioned, is characteristic. Their harp was similar in form to the Irish; their favorite instrument was the bagpipe. King James I is credited with having done much to stimulate an interest in music among his subjects. Having been a captive in England for a period of eighteen years, he had acquired great skill in music, which was the solace of his weary hours. According to a contemporary historian, the king played a great many of the instruments in use in his day: the bagpipe, psaltery, organ, harp, lute, flute and dulcimer. The music of Scotland makes great use of the pentatonic scales, and it is likely that the original form of many of the old Scottish folk-melodies was pentatonic. A characteristic feature of Scottish music is the so-called "Scotch snap," illustrated in the short notes in the familiar air "Comin' Thro' the Rye," and in the following dance tune:

[Music: STRATHSPEY]

An instrument of so marked characteristics as those displayed by the bagpipe will naturally develop a characteristic style of music. The pipers gave extraordinary study to the mastery of their instrument and noted players acquired wonderful skill.[8]

=England=.—Until the time of the conquest of England by William of Normandy (1066), music among the Anglo-Saxons was practiced by the scalds or bards, minstrels (also called gleemen), and the monks in the monasteries. Poetry and music were much encouraged by some of the kings and Alfred the Great (849-901) was widely famed for his skill in playing the harp and as a singer. In the manuscripts belonging to these early days in England we read of such instruments as the psaltery, the rota, little harps of eleven strings, viols, called fiddles, citharas, cornets, trumpets, etc.

[Illustration: SCANDINAVIAN LUDR.]

=Scandinavia=.—The Runic style of writing,—which has numerous analogies to the neumes,—used by the northern people, presents many difficulties in the matter of translation, so that we have little chance to form an opinion as to the early music of the Scandinavian races. They have their national poems, a presentation of their myths in the Edda, and the deeds of their great heroes in the Sagas, songs which inspired both poets and musicians, an office most generally found united in one person, called a scald, (equivalent to the Saxon bard). The sagas were sung or chanted by the scalds to the accompaniment of a small harp. In 1639 and again in 1734, in the duchy of Schleswig, horns of pure gold were found which had been used in the worship of Odin, covered with Runic inscriptions, which have not yet been satisfactorily deciphered. Other instruments belonging to this period that have been discovered and preserved in museums are bronze horns somewhat curious in shape, called lüdr. These instruments have been tested by experienced horn players and give forth a fine, resonant tone. Up to the present nothing has been discovered to indicate that the northern races had a system of musical notation; melodies were undoubtedly transmitted by oral communication.

=Finland=.—The people of Finland are intensely musical and have many beautiful folk-songs. Their national epic is called the "Kalevala," and gives the history of the hero, Wainœmonien, god of music, who by the exercise of his art, became the master of the universe, analogous to the Greek myth of Orpheus. The Finnish bards used an instrument called Kantèle or Harpu, a sort of psaltery with five strings forming the first five notes of the minor scale, G fourth space, bass staff, to D above.

=Progress in Southern Europe=.—As may be gathered from the hasty survey of music among the nations in the west and north of Europe, they did not contribute to its growth during the centuries under consideration. It was in the south of Europe that the forces were forming, and not in the Church as heretofore, but outside, among the people. We cannot say who composed the songs of the people, so different in character from the songs of the Church; they seemed to spring up spontaneously and were passed from one to another orally. The _music of the Church lacked measure_ or rhythm, as we may say, while the _music of the people_, closely associated with dancing, was _rhythmic_. In fact, the scholarly musicians of that period condemned the music of the people because of its marked rhythmic character. On account of the crudeness of the early instruments, often the lack of them and of competent players, the people were accustomed to sing to their dancing, a custom still followed in certain places. The next step was an easy one, that of making new verses to familiar airs. Another factor in spreading music among the people appears in the _traveling minstrels_. Without a fixed residence, owing allegiance to no lord, by law, in many cases, out of the pale of society, these free sons of art, who began to come into prominence in the 11th century, roved from place to place, resting for the night in castle, monastery, inn or wayside camp. In return for the hospitality freely given, they sang the songs they learned from each other and in the various lands they visited. Their accomplishments in the music line were varied. One, Robert le Mains, said: "I can play the lute, the violin, the pipe, the bagpipe, the syrinx, the harp, the gigue, the gittern, the symphony, the psaltery, the organistrum, the regals, the tabor and the rote. I can sing a song well and make tales and fables."

=Trouvères=.—Another influence was also at work, one that was greatly to affect music, raising it from the level of common entertainment to an art patronized by the highest social circles. The Crusades left a permanent influence upon the people of Europe and upon the institution of Chivalry, the knightly singers (trouvères) vying with each other in verse and song, as well as in arms. Education took a higher place and schools became more numerous (12th and 13th centuries), and music was given recognition; this was the case not only in schools connected with monasteries, but also in the newly established universities, such as that at Paris. Secular music also had schools, so to speak, for, during Lent, when all gay songs were forbidden, the trouvères and minstrels would stop at some convenient point and teach their songs to all who would learn; hither the great lords would send the minstrels in their pay to renew their repertoires and learn the songs that were most favored by the polite world. It was not possible that much advance could be made in musical education, from a scientific side, for there was _no_ general _system_ of _convenient notation_. Airs were taught by playing them over, the singer with the ready ear having the advantage. Still the efforts and studies made in the monasteries and schools were not fruitless, although the systems evolved were very complicated, making the reading of music a difficult matter.

=The Music of the Period=.—It is a fortunate thing for the investigator of the history of music that, at the present time, a number of collections of the airs of the 12th and 13th centuries are still in existence; for example, in the National Library, Paris, which possesses a number of magnificent manuscripts, containing songs noted down by the French trouvères; also in the Library of the Medical School of Montpelier there is a collection of nearly four hundred songs, secular and religious, for two, three or four voices. The _melodic ideas_ of this period, as indicated by these manuscripts, were _vague_ and the _rhythms uncertain_. Yet this music, barbarous as it appears to us, was not the product of chance, as we may think; it had its rules, just like the music of today, the art of composing being called Discant, referred to in Lesson VI. Sometimes these singers of the 12th and 13th centuries tried to invent original airs, very frequently they would take several familiar airs, two, three or four and combine them in what seems to us a crude

way, yet in a manner that was pleasing to the hearers of their time. The style of the songs in use varied greatly, in spite of the poverty of musical resources. In general, a song for one voice was used only in setting the _Chansons des Gestes_, _Romances_, _Pastourelles_, _Serventois_, _Lais_ and _Jeux Partis_. The discant style was used in _Motets_, _Rondeaux_, _Conduits_; according as these latter compositions were for two, three, four or five voices, they were called _duplum_, _triplum_, _quadruplum_, and _quintuplum_.

=Troubadours=.—The cradle of the French troubadours was in Provence, the south of France. They usually belonged to the nobility, and, instead of performing their own pieces, had them performed by the _jongleurs_, only occasionally consenting to sing for some company of high-born nobles and ladies. We mention a few of those who were counted among the troubadours: Richard the Lion-Hearted, of England, Count William of Poitiers, Rambout, Count of Orange, Pierre d'Auvergne, Pierre Ramon de Toulouse, Pierre Vidal, Pons de Capdueil, poet, singer and violinist, Aimeric de Pequilain, Blagobres, a virtuoso on all instruments, Blondel de Nesle, the Chatelain de Coucy, Thibault, King of Navarre. Clement, the French historian, gives a list of 28 trouvères of the 13th century, less prominent socially than those already mentioned. The most celebrated of them and the most important from the historian's standpoint is =Adam de La Hale= or =Halle=, born 1240. He wrote many pieces, of which we have thirty-three songs, some rondeaux, six motets, some _Jeux Partis_, among the latter being a work which is regarded as a sort of comic opera, sometimes called the "first opera": "Robin and Marion"; it consists of dialogue and airs.

[Music: AIR FROM ROBIN AND MARION.]

[Illustration: INSTRUMENTS OF THE MINNESINGERS.]

=Minnesingers=.—While the trouvères and troubadours were singing in Provence and in France, an analogous association was forming in Germany, to which the name Minnesingers (_Minne_, old German, "love") was given. A list of names belonging to the 13th century includes 162 men, among whom are several occupying thrones. Names that have interest for us are Klingsor, Wolfram von Eschenbach (author of a poem on "Parcival"), Gottfried of Strassburg (author of a poem "Tristan and Isolde"), =Walter von der Vogelweide=, the =Chevalier Tannhaeuser= and Heinrich Meissen, called Frauenlob. Richard Wagner has introduced some of these men in his operas. The versification of the Minnesingers has been much admired by critics; it was filled with art as well as beauty. Their love themes differed from those of the Provençal singers in that while the poetry of the latter declared love as a gallant sentiment, the Germans gave it a loftier tone by mingling it with the Madonna sentiment.

=Folk-Song=.—While the German nobles were employing themselves in the service of art, the people were not idle. They had their tunes and their verses. The _Locheimer Liederbuch_ (1452), contains a number of songs, some of which are undoubtedly very old; they are melodious, varied in rhythm and full of naïve simplicity. Some of them are arranged in the popular _three-voice_ style, and show correct part leading, the inclination being _toward our major and minor modes_ instead of the Church Modes.

[Illustration: HANS SACHS.]

=Mastersingers=.—The most noted musical organization among the people was that of the Mastersingers (celebrated in Richard Wagner's opera); Nuremberg, Mayence, Strassburg and Frankfort were their centres. The members were organized into a Guild, just as was the case in trade affairs; they had a charter from the Emperor Charles IV. Their poetry and music were not elevated, for the members of the Guild were not of a standing and an education to give them real skill in the fine arts. The records of the Mastersingers show that the members were principally tradesmen, such as farriers, armorers, locksmiths, tailors, cobblers; yet there were some members who could lay claims to culture and higher standing, as engravers, physicians and a few gentlemen of leisure. The most conspicuous of them all was =Hans Sachs=, the cobbler-poet of Nuremberg. Their works were marked by _monotonous melody_, (for the pitch is but little varied) and a heavy, clumsy rhythm. To make up for the lack of real artistic idea they were _pedantic_ to an extreme; composition was hedged about by a multitude of rules, to which composers must give exact obedience. These rules were given in a code called Tablatura. They held contests in which the members vied in producing works exemplifying the principles of the organization.

QUESTIONS AND SUGGESTIONS.

What country in Europe was inhabited by the Gauls?

Where did the Celts live?

What countries did the Scandinavians inhabit?

Give an account of their music.

Describe the work of minstrels, jongleurs, trouvères, troubadours.

Where did the Minnesingers live?

Tell about the Mastersingers.

Give the names of minstrels or other singers famous in history.

What was the condition of the artisan classes and guilds in the larger German cities at this time?

If possible, get the stories of the operas, “Tannhäuser” and the “Mastersingers of Nuremberg” and read them privately or in the class.

SUGGESTIONS FOR A REVIEW OF PREVIOUS LESSONS.

Give an idea of the process by which music becomes an art and what the principles of music are.

What sciences are drawn upon, and how, in the study of the beginnings of music?

What countries offer interest to the student of musical beginnings? How are these races related?

Give a summary of music among the Chinese. The Japanese. The Hindoos.

Give a summary of music among the Chaldeans. The Egyptians. The Hebrews. What points in common did these races show?

Give an account of the writers on music among the Greeks, and their works.

Describe the Scale of Conjunct Tetrachords. Disjunct Tetrachords. The Lesser Perfect System. The Greater Perfect System.

Give the names of the various Greek Scales.

Give a summary of the Greek Octave System. Describe the Chromatic and Enharmonic Scales.

Describe the Greek musical instruments; notation.

Tell the story of music among the Romans. How did the Church Scales originate? State the differences between the Greek and the Church Scales.

What is the function of the Dominant in the Church Scales? Describe the Hexachord Scales and the names of the sounds.

Describe early systems of notation in music. Describe early attempts at Harmony. What was Discant? Give a summary of the statements of the early writers on the subject of Harmony.

Give an account of music among the Gauls and Celts, the Saxons, Scandinavians, etc.

Tell about the great song movement outside the church, minstrels, etc.; the Minnesingers; the Mastersingers.

Each of these questions or several together may be made the subject of a written paper, giving a summary. Students should be encouraged to make critical examination of a subject, to institute comparisons showing progress, and the steps that mark that progress, wherein one man has drawn from a predecessor, wherein new things have been done.

LESSON VIII.

THE CAUSES OF POLYPHONIC DEVELOPMENT AND THE IMPORTANCE OF THE POLYPHONIC ERA.

In the Introduction attention was called to the fact that the labors of musicians to develop an art of music varied between the effort to make artistic use of the material of music, that is, to give it definite form, and to make it express the feelings of mankind; the first is in the line of construction, the second, content. The period we now take up was concerned most deeply, in its earlier stages, as we shall see, with finding adequate and logical principles of construction by which a musical composition of more or less length could be made from a simple musical idea and in which more than one voice could be used.

This period should be studied with the greatest thoroughness, and all possible examples of music of the composers representative of the period should be examined that one may gather a clear idea of the beginnings of composition and the development that shows from one generation to the next. These first gropings after the principles are matters of extreme interest to the musician when he compares the results in the music of the twentieth century.

=The Polyphonic and Monophonic Styles=.—Students frequently express surprise that the complicated polyphonic or contrapuntal system, which began to take shape in the 11th century, should appear first, historically. The pupil in composition begins his studies with the harmonic or monophonic style and is afterwards inducted into the polyphonic style. Why did the musical art develop along polyphonic and not on the simpler lines? It is intended that this lesson and those that follow shall show some of the influences that caused the line of development to move in a polyphonic and not in a monophonic direction. One thought is important to note. The elements of the simple, monophonic style _were present_ in the music of the early centuries, in the _people's song_, principally; since, however, it was the Church that determined the direction of artistic composition, the simple, natural principles of melody-making _yielded precedence to_ a more highly organized, _intellectual process_. Before taking up the consideration of these matters it is well to get an understanding of the terms Monophony and Polyphony.

There are two methods of giving harmonic support to a melody: by adding an accompaniment of chords, in simple or elaborated form, or by dividing the notes of the chords among three or more voices, which notes are sung or played simultaneously with the melody (an example is furnished by any simple air with accompaniment or a hymn-tune in four parts, in which the "air" or melody is in the soprano); this is Monophony, (_monos_—Greek for "one," _phone_—"sound"); a second method is to add to the given melody other melodies, each independent in its movement up and down and in the duration of its successive sounds so far as concerns the movement and duration of the sounds in the given melody. This is Polyphony (_polus_, Greek for "many").

=Relation of Polyphonic to Modern Music=.—The exact relation of the Polyphonic Era to modern music has rarely been correctly estimated. Writers on this phase of the development of music are apt to lose themselves in wonder on noting the scientific growth of the art, and to express their great surprise that so peculiar an evolution should occur. This view of the question is totally inadequate. In order truly to estimate the value and influence of the period, it is necessary to inquire into the properties of the materials of musical construction which were developed, and the value of those materials as a foundation for the modern structure of music, apparently so different from the early forms, but yet so intimately related to these forms.

Polyphonic music presents to the student so complex a form as to require the aid of material imagery in order to help the mind to a proper conception of it. Perhaps no more misleading idea has been advanced than that which makes use of the Gothic cathedral as an illustration of polyphonic form. It is true that in its multiplicity and yet inter-relation of details the cathedral expresses one of the dominant ideas of polyphonic music; but here the likeness fails. A nicer perception of the subject may be gained by comparing _polyphonic music_ to the _foundation of a Gothic cathedral_, strong and massive in construction, of utmost need to the permanence of the building, but entirely lost sight of in a general view of the whole structure; the importance of the comparison being the likeness of the complex and highly-developed superstructure to monophonic or modern music, seemingly so independent of what lies beneath, but in reality, dependent upon, and intimately connected with the established basis. Only in this way can we apprehend the real value of the polyphonic foundation to our superstructure of modern music; but for that foundation our modern music must have remained in its infancy for centuries to come. No freedom of artistic expression can be gained until absolute command of the material to be used has been obtained, and the principles thoroughly assimilated by the artist.

=Polyphony and Monophony Contrasted=.—In the concrete, _polyphonic_ music may be represented by a series of lines representing _separate_ and distinct _melodies_; though a principal melody is always used, it is not supported by chords of harmonic structure but by other melodies, or transpositions of the same melody, so used as to contrast with and support each other. Polyphonic music was essentially melodic, and, as has been very aptly stated, is to be thought of horizontally. Monophonic music might best be represented by one horizontal line supported at intervals by short, perpendicular lines. In this case the horizontal line represents the only distinct melody, and the perpendicular lines the subordinate or harmonic support or accompaniment. The following example illustrates the process of using the same melody to furnish the principal idea and also the accompanying support, the latter being at the same time simply a transposition of the original melody.

[Music: Lento 1st Voice 2d Voice 3d Voice]

Polyphonic Style. Bach Fugue. Subject (or melody) enters in measure one; again, transposed to the fourth below in measure three, and one octave below in measure ten. Enough is cited to show the horizontal structure of polyphonic music.

To present the idea more clearly and for the sake of contrast, a melody with accompaniment is shown in the next illustration, giving a single melody with the subordinate chord accompaniment, the chords in whole notes indicating the harmonic structure or basis.

[Music]

Beethoven, Op. 24, Monophonic Style. Sonata for Violin and Piano. Melody enters in measure one with subordinate accompaniment.

=Search for Structural Principles=.—While this question of the relation of polyphonic music to modern music may not apply to the first step in the development of the polyphonic style, yet it furnishes a preface to a discussion of the earliest stages of polyphonic evolution. The period preceding the year 1000 A. D. was truly a _period_ of _fundamental research_ into the underlying principles of melodic and harmonic structure; but so crude and hesitating was the use of what was found that it is certain that polyphonic material was entirely misused until the birth of “measured music” dispelled this darkness by the enlightening influence of Proportion and Form. So many forms of musical growth, such as came in later years, were impossible without the mensural proportion, that is, music written so as to indicate duration, that this initial period gathered but a chaotic mass of musical material which was left undigested and unassimilated until the epoch of the Paris school.

=Beginning of Polyphony in Greek Magadizing=.—The music of the Middle Ages has great interest for the historian and the student. It stands between our music and the music of the ancients; it drove its roots deep into the ancient time and extended its branches far into the contemporaneous epoch. It is the struggle between the two elements, the changes foreshadowed and apparent that give such interest to the history of music in the Middle Ages.

Polyphonic music was long in growing. To understand clearly, one must examine it from its very _beginning_ in Greek _magadizing_, referred to in Lesson V. Music for many centuries was, in all its most important phases, entirely vocal. The ancients, probably because of the crude forms of their instruments, valued the human voice as the most suitable means of expressing the feelings through music, thus causing the peculiar phenomenon of the extremely late development of dissonances. While instruments can easily perform even the harshest of the dissonances, it is almost impossible for untrained voices to sing other than the more simple consonances. For this reason, the dependence on the voice as practically the only medium for the expression of musical ideas forced the cultivators of music to use the simple consonances of the octave, fourth and fifth. In its earliest stages music was entirely melodic and was limited to the use of one distinct melody, so that, no matter how many were singing, but _one melody_ was employed. Soon arose the problem of accommodating the voices of boys and men to the same melody. It was manifestly impossible to have men and boys sing in unison, because of the difference in the compass of their voices; so the Greeks hit upon the plan of causing them to _sing in octaves_, a plan which science sanctioned, for had not Pythagoras proven that the octave, after the unison, was the most perfect consonance? This the Greeks called Magadizing. Why the Greeks, knowing as they did the other consonances, did not magadize in the fourth and fifth cannot be explained; the only argument that can be advanced is, that their melodies were so limited in range that the voice of any man, whether tenor or bass, could without difficulty reach the highest or lowest tones of a melody in unison. While magadizing among the Greeks cannot be counted as a great advance toward the realm of polyphony and harmony, yet it was the first important step in the evolution, and as such, is important. So far, the voices singing _simultaneously_, though at a different pitch, and moving together in _similar_ time values, followed monophonic methods.

=Organum the Next Step=.—Further development did not take place until the destruction of Greek civilization had occurred and a sufficient lapse of time had allowed the Christian Church to establish itself: in a religious sense, in the hearts of the people, and in a permanent sense, by building churches and monasteries. In these monasteries we find the next great advance in magadizing, though now under the name of Diaphony or Organum. The musical learning of the time was painfully inadequate for the uses to which it was put. There remained in existence only a few of the Greek scientific scales, and those woefully distorted in form; no simple notation or musical literature; and in all probability, only a tradition in regard to the melodic construction and magadizing. Perhaps this was just as well, however, for the problem confronting these monks differed greatly from that solved by the Greeks. In the monasteries _only men’s voices were used_, and these without special regard to the compass. The problem was this: Given a melody to sing, using men’s voices of every range, from high tenor to low bass, without using independent parts. The difficulties were two in number: they had no conception of independent parts, and their melodies were of greater range than those of the Greeks, thus forbidding the practice of singing entirely in the octave or unison. The solution was reached in the following way, as indicated in the preceding lesson: If the octave, unison, fourth and fifth were consonances, why not _sing in the fourth and fifth_ as well as in the unison and octave? They had as yet no idea of singing two distinct melodies at the same time, but thought only of singing the same melody in the most consonant or agreeable manner. The result was music which sounded like the following

example; while it was crude and harsh, it gave every monk opportunity to sing simultaneously the same melody, no matter what the range of his voice:

[Music]

About the close of the ninth century, as we learned in Lesson VI, at the time of =Otger= or =Odo=, an abbot of Provence, in France, organizing had so developed as to be written for as many as four parts, using, however, only the perfect consonances, as the next example will show. In reality there are but two parts, as the two lower voices double the upper.

[Music]

=Secular Organum=.—The most remarkable advance is shown in a form called Secular Organum, probably because of some relation to the Folk-song and the common people. This form showed the use not only of perfect consonances but of the imperfect consonance of the third; and, wonderful to relate, of a second, though only in a passing sense. That such a discord should be used is a remarkable commentary on the inherent sense of harmony which seemed to exist naturally, even at that early day. This form may have had its germ in the drone bass supplied by the bagpipe, which figured in the music of the people.

[Music]

Example of Secular Organum showing use of third and second.

=The Workers=.—Two men, as was shown in the preceding lesson, were instrumental in remarkably furthering this growth of music. =Hucbald=, of St. Amand, in Flanders, was born in 840 A. D. and died in 930. He was a friend of Otger of Provence, and it is through the latter that some of Hucbald's work is preserved. Hucbald probably never wrote in organum of more than two parts, though mention is made of an organum credited to him and having in addition to the two voices, a third singing a pedal-point, or a bass on one single tone. His principal work is a manuscript on organum, a work of great reference value. =Guido of Arezzo=, born 990, died 1050, is of even more importance. Unlike Hucbald and Otger, he seems to have been more than a secluded monk, for he visited Rome and was a well-known figure in the church. He was a most active teacher, and while his chief work was in developing notation, he nevertheless contributed important material in the form of organum, writing in as many as four parts, though in respect to the use of the less perfect consonances he was very little freer than Hucbald.

A short example, extracted from an 11th century three-part composition, is given here as a specimen of the combinations and successions that were tolerated by the ears of the Middle Ages, and to show the tendency toward greater freedom in the direction of the motion of the parts, pointing toward those principles which later formed the science of Counterpoint.

[Music:

TENOR (sounds lower octave)

TENOR (sounds lower octave)

BASS]

Several interesting points may be seen in this barbarous composition: First, the imitation by the second tenor of the phrase given by the first tenor. This is evidently intentional, as this phrase occurs three times in the course of the composition and is imitated in the same way every time. This same phrase occurs near the end of the bass part (which is the theme or _Cantus_) and it _may_ have been chosen for this very reason for use in the Discant parts. Secondly, the initial and final chords, viz.: root, fifth and octave—are familiar to all students of Strict Counterpoint. Writers as late as Cherubini call this combination the best for beginning and ending Three Part Counterpoint.

=Development Determined by the Church=.—The Church and its beliefs were responsible for this singular yet not illogical development. Considering the peculiar monastic conditions, the evolution could not be expected to occur along lines which it would have taken had it been developed among the people and under the influence of the Folk-song. The learning of these monks was largely in church lore, and this, with a desire for a peculiar church music, led to the _discarding_ of the natural and vivacious _melodies_ and _rhythms_ of the _people_, for the scientific and ascetic music and discipline of monastic religion. The one great advantage of this period to modern music was the constant association with the principal intervals of the scale; an association which may be partially responsible for our modern Tonic and Dominant harmonies. On the whole, this period represents the marking out of the lines of musical development for the eight centuries following, though the men responsible for this beginning

could hardly have known or appreciated the impetus which was to be given polyphonic music by the invention of their simple devices to accommodate voices of different compass and to secure concerted singing.

QUESTIONS AND SUGGESTIONS.

What is meant by Monophony? Polyphony?

Make an analogy between Polyphonic music and Architecture.

Contrast Polyphony and Monophony by the use of lines.

What was the nature of the researches in music before 1000 A. D.?

How did the Greek magadizing influence musical development?

What is Organum? Secular Organum?

Who were the prominent musicians of this period?

How did the Church influence musical development?

The teacher or one of the pupils may give a summary of the Gothic style of architecture. Another pupil may give the most noted historical events coinciding with this period; also historical characters. Scholarship was cherished principally in the Church and in the monasteries, hence the predominance of Churchmen in the early history of music. Hucbald lived during the time of Alfred the Great; Guido died 16 years before the battle of Hastings (1066). A useful device in fixing the details of a lesson is for the teacher to arrange that the pupils shall question him, the questions to be of such a nature as to show that they know the lesson thoroughly.

LESSON IX.

THE PARIS SCHOOL.

=Influence of Art on Music=.—All of the fine arts, with the exception of Music had, by the year 1100, reached a fairly high stage of development due, no doubt, to the fact that they are to a great extent composed of concrete materials. Music, owing to its lack of the concrete and the inability of men literally to place their hands upon its material, had lagged behind, so that in 1100 we find only a small amount of material, and that in a most chaotic condition. This material was, however, sufficient to produce definite musical forms if united into a homogeneous whole; such a state, however, could be produced only as the result of some great influence which would galvanize the component parts into action. Fortunately, there was just such an influence, one which had passed through an evolution similar to that needed in music, though because of its more concrete form and its necessity to man, this evolution had occurred at a proportionately earlier date. This influence was an art form, a phase of architecture known as the Gothic. Gothic architecture was a form built up by the unifying of the principal styles of architecture into one uniform whole, and composed of a _multiplicity_ of _details_, but of such evident _relation to each other_ as to make a distinct art form. This form was first used in Paris about the year 1000 A. D. Music was, approximately, in the same condition as Architecture before the birth of the

Gothic principle, and needed a stimulus, a comrade art undergoing much the same evolution, to start it on its path of polyphonic development. In the year 1100 musical chaos became united into one uniform art by means of Measured Music or Proportion, thus allowing the systematizing of the mass of then existing material, and the construction of definite art forms. Since Architecture had undergone just such a change one century before, it is more than probable that the effect of this change was the starting of a similar one in Music, though the result was not to show until one hundred years after its occurrence in the kindred art.

=Paris the Centre of Europe=.—It was natural that these two great changes should take place in Paris, at that time the centre of wealth and learning for all Europe. Paris, in addition to its many other advantages, had long possessed a great university which had produced many scholars and theologians. The influence of the Church in all art was then paramount, for all art was employed in the service of the Church; Architecture gave to the Church its Gothic cathedrals; Painting and Frescoing its marvelous interior decorations; while Music made possible the richer forms of the service or liturgy. In that sense the Church, in its centre of theological study, would undoubtedly react on the practice of music and produce more beautiful forms for the service. In this period it is worthy of note that all the _famous musicians_, as before, were _monks_, or men employed in the Church, and the reason for this condition is plain: there was no art of music outside of the Church.

=Measured Music=.—Just as the use of many voices produced singing in parts, so did it produce Measured Music. To make it possible to use more than two parts at the same time it was necessary to have some definite agreement as to the value of the notes, in order to have certain uniform times for beginning, ending and performing the different portions of a composition agreeably; and so Measured Music was born. It may be said here that the different metrical divisions were not shown by means of bar lines as we now use them, but by different groupings of the notes, the time value of each depending on its relative position to the others. Perhaps of all forms produced by this system, the _Organum Purum_ was the earliest and most peculiar. It consisted of a _Cantus Firmus_ set to words, and metrical in form; a second voice freely extemporized a higher part, evidently the only rule being that the two finish together. At a late date, strict Discant sometimes alternated with the old Organum, making it much less free in character.

=The Important Forms=.—In reality, the important forms produced were entirely in strict metrical divisions. Of these, the most important were the so-called strict Organum, the Conductus, the Roundel and the Motet. Of the strict Organum very little is known, excepting that it was a strictly metrical form, differing, in that sense only, from the Organum Purum; it had also words for all parts and not only for the Cantus Firmus, as had the older forms. The Conductus, from the Latin _conducere_, to conduct, was important, and was a secular form having as its basis a popular melody or a newly invented one, secular words and much freer intervals than church compositions. Each part was expected to be melodious; and it varied from two to four in the number of voices used. It was sung during a march, a funeral cortège or procession.

[Music]

Conductus for three voices showing that each part is a distinct melody. Oxford History of Music, Vol. I.

=The Roundel=, from an historical view-point, was the most important form, for in it much use was made of Imitation. It can best be explained in the words of Walter Odington, a theorist of the time: “Let a melody, with or without a text, in one of the regular modes of rhythm, and as beautiful as possible, be devised, and let each voice sing this in turn. And at the same time let other melodies be devised to accompany it in the second and (if there be three voices) in the third voice; let them proceed in consonances, and so that when one voice ascends another descends, and let the third not follow too closely the movement of either of the others, except perhaps for the sake of greater beauty. And let all of these melodies be sung by each voice in turn.” While the use of Imitation is important in that it recognizes the _repetition_ of a set phrase as an _aid_ to _Unity_, its importance is detracted from, at least at this period, because it was not used in any of the other forms then in vogue.

[Music]

Roundel for three voices showing Imitation. There are six distinct melodic phrases, and by numbering these wherever they appear, the Imitation can readily be observed.

=Imitation a Means of Securing Unity=.—An art form must submit to the laws of the human mind, which demand that a work of art shall show three principles: Unity, Variety or Contrast and Proportion or Symmetry. The problem set before the old composers was to produce musical works which should exhibit obedience to the canons of art as determined in the sister arts which had already reached great perfection. Unity in a musical work means that it is a development of one central thought, in elaborate works, of several leading ideas. The germ of a musical composition is in the Theme. The composer’s problem is to elaborate a piece of some

length from this Theme, in that way to secure Unity of idea. If he were limited to writing in one part, he would be compelled to _repeat_ the Theme a number of times, either on the _same_ or on a _different_ degree. When he must write for three or more voices the problem becomes more complicated. Let us imagine a composer of the 12th-century at his work. He has a theme to use, like the one in the example at the end of the preceding paragraph, which he is to use in three parts. From the composers of the preceding centuries he received the principle of _transposing_ the theme a fourth or fifth or octave higher or lower, thus singing the same melody _simultaneously_ at different pitches; but this he rejects as crude; he has passed that stage and wishes to use a newer, more advanced method. Obviously his recourse will be to let each of the other two voices sing the opening theme _successively_ at the same pitch. To stop with this change would result only in three successive repetitions of the opening theme; so he makes the second and third voices sing the phrases used by the first voice after the first theme has been given, which serve as an accompaniment to the second and third entries of the first theme; thus all the voices sing the various phrases, at different times and in different successions, as shown by the numbering of the phrases. In later times the principal phrases were sung _successively and transposed_ at the same time. This principle of Imitation is the very foundation of the later complicated polyphonic system.

=The Motet=.—In the form of the Motet we note many peculiarities. Each voice had different words, though the Tenor or foundation of the composition used but _one_ single word throughout; also, the Tenor was composed of a certain metrical and melodic figure closely adhered to and built up out of some popular song. The words and the form were sacred in that they were used in worship.

=The Men of the Time=.—There are many men who wrote in these forms but it is only necessary to examine those of importance. =Franco of Cologne= (1150-1220), (dates disputed), an organist, was probably the pioneer in the adoption of Measured Music. He first advocated the use of triple meter and classified the dissonances of major and minor thirds and sixths. He used his influence _against_ the use of _consecutive fourths_ and _fifths_, and _for_ the use of _contrary motion_. The result is in many ways shown in the following example:

[Music]

=Leonin= (about 1140) and =Perotin= (his pupil) were organists at Notre Dame in Paris. The former was noteworthy in the reform of notation, while the latter is known principally for his use of crude Imitation, and a tendency not to use consecutive fourths and fifths, though he never entirely succeeded in eradicating them. =Franco of Paris= (1150———), often confused with his namesake of Cologne, was a theoretician, improved notation, and wrote a treatise on Mensural Music. =Jean de Garlande= (1170-125—) not only wrote a very valuable treatise on Mensural Music, but was also a composer of note; his writings contained specimens of Double Counterpoint, though probably used without the intention of producing them. =Jerome de Moravie= (1260) wrote a scholarly treatise on Discant, and such was his ability that he illustrated it with his own compositions, making it one of the most valuable reference works in existence. It is worthy of mention that all of these men were churchmen in the sense that their work was all done in, or with the approval of, the Church, and was therefore influenced by the peculiar beliefs and customs then obtaining in that institution. This point must ever be kept in mind, for any prolonged contact with Folk-music must have changed the entire development of the art; therefore we must regard the Church as the dominant influence of early music.

=Summary=.—The work of this period can hardly be over-estimated. First we see the influence of the Gothic in architecture, producing a corresponding unity in music; a unity which was concomitant with Measured or Mensural Music. We next see the attempt to combine metrical with unmetrical forms in the Organum Purum, and the final result in the strict form of Organum. Then we note the freedom shown in the Conductus, Roundel and Motet, as well as freedom in the use of more pleasing intervals, with the tendency to eradicate consecutive fourths and fifths; the use of contrary motion instead of parallel, and the consequent melodic freedom of the voices, and finally the use of Imitation, though perhaps unintentionally, except in the Roundel. This period then marks the acquisition not only of new intervals, new forms, new styles of melodic writing, imitation, measured music and simple counterpoint of note against note, but also forms the foundation for a rapid development by bequeathing to the Gallo-Belgic School a wealth of material, bound up with rules and only half-suspected as to its value, it is true, but broad and firm enough to sustain a mighty structure of true Polyphonic Music.

QUESTIONS AND SUGGESTIONS.

How did art influence music?

What made Paris the centre of Europe?

What was Measured Music?

What forms of music were developed in this period? Explain them.

Why is Imitation a logical process toward securing Unity in musical construction?

Who are leading composers of this period?

What are the successive steps of development as shown in this period?

The historical period corresponding with this lesson extends from the death of William Rufus, son of William the Conqueror, to the death of Richard the Lion-Hearted, and includes the Crusade in which that hero was the principal figure. It will be remembered that Richard was a great patron of minstrelsy.

LESSON X.

THE GALLO-BELGIC SCHOOL.

=A New Art Centre=.—The development of any art, and more especially Music, requires the dominance of wealth, learning and general civilizing forces, to form an epoch-marking school. Paris for a time satisfactorily filled these conditions, and then gave place to a school, stronger and better equipped: that of the Netherlands. There were several reasons for this change in the centre of musical activity. So long as Paris was dominant in wealth and civilization, and so long as she maintained her supremacy in the intellectual fields of the Church and university, so long did she retain the centre of culture; but when her wealth became such as to produce degeneracy in the taste for pure art, and love of show rather than real worth became predominant, then her native pupils began to lose their intellectual strength, and the pupils from foreign countries began to furnish the real culture. The establishment of the Papal See at Avignon in the south of France doubtless contributed to the supremacy of France in music and the liberal arts. When the See was restored to Rome, in 1377, Paris and her school of music were relegated to the background. From this period on it was but a matter of time for these pupils to carry the centre of musical culture from Paris to a place possessing a foundation for musical growth, and a greater number of strong minded scholars, and where political conditions were favorable. The Netherlands surpassed Paris in all of these important particulars, though not at the time when the Paris School ceased to be of importance. There was a school of transition which filled the space left between the important work of Paris and the supremacy of the Netherlands; that school was the Gallo-Belgic, located northeast from Paris on the borderline between France and Belgium, Tournay being the centre. The school at Paris was occupied in acquiring material for use; the school of the Netherlands developed polyphonic music emotionally; the step from acquisition to arrangement of material was necessary before emotional development could occur, and that was the work of the Gallo-Belgic School. This school was located in the country of Hucbald and Odo, who had built up there, a little while before, a system of music which was the foundation of the polyphonic style, and which had prepared the people for a culture of greater value and importance. Thus we see that musical development followed the line of greatest preparation, and utilized the preparatory work furnished by these two men. And finally, it was a direct step toward the Netherlands which were even then beginning the struggle in which they were victorious, for supremacy in commerce, art, and music.

=Contribution of the Paris School=.—When the Paris school ceased to be of utmost importance to the world of music it had bequeathed to the later schools Measured Music, and its forms of Organum, Motet, Conductus and Roundel, and the use of certain not unpleasing intervals, though occasional consecutive fourths, fifths, and octaves appeared. It was, then, the business of the Gallo-Belgic school to refine these intervals, develop measured music, and so improve and develop these old primary forms,

eliminating some and evolving others, as to give the school of the Netherlands, one century later, forms pleasing in intervals and of sufficient unity and design to afford opportunity for the infusion of the emotional. In the matter of intervals much was done to develop and use the old ones, excepting the consecutive fourths and fifths which were abolished never to appear again, and many new, or previously unused intervals, were made use of. In the matter of forms, we hear no more of the crude Organum and Conductus, but a little about the Motet, and nothing at all in regard to the Roundel, as such. It is, however, due entirely to this last form that polyphonic music developed; though we hear no more of the Roundel, we do hear much in regard to the Canon, and the Canon was but a highly developed species of the Roundel.

=Imitation and the Canon=.—The use of Imitation, as we have seen, gradually became more and more important. The old monks, in the very beginning, imitated melody in the fourth and fifth; at the time of the Paris school these melodies were combined with new ones making Imitation with more than one melody, though the melody underwent no real organic development. Now we see in the inception of the Canon a development of real Imitation of only one melody, but given _Variety_ by use of the devices of Inversion, Augmentation, Diminution, etc. And not only did this occur in the Canon, but we find it also in the other forms, in a freer style, adding materially to the _Unity_. Imitation is the foundation principle of polyphonic music, and this principle was present in the crude efforts of the old monks, in the more intelligent efforts of the Paris school, and now for the first time, receives, in the Gallo-Belgic school, a partial recognition of its real value, and a commensurate use.

[Music]

Naumann, History of Music, Vol. I, page 315, extract from a chanson by Dufay. Figure 1 shows the principal melody, figure 2 shows the same at the fifth below. The entire chanson is quoted in Naumann with the various imitations fairly well marked; the student should refer to it.

=The Value of Imitation=.—We must understand, however, that mere Imitation is in itself not a remarkable phenomenon. We imitate, more or less unconsciously, in all arts, and even in our daily habits; but this would be of no lasting importance did we not take that imitation as a foundation for future development, as did the composers of this school. And in these polyphonic schools the imitation was unintentional, as a definite aid to the structure of a musical idea, until it was seen that the _imitation_ must be _confined_ to _one definite idea_ or melody. It was then that the original treatment of melodic development began, and the various devices for developing a melody, without changing its organic structure, inaugurated. This marked the beginning of a school of musical art, a school of definite, and not chance evolution; or in other words, arrangement and development of the earlier acquired ideas.

=A Technical Principle=.—A little consideration will show how the principle of Imitation was developed. The first step was to imitate a melody at a lower or higher pitch and sing the two or more versions _simultaneously_; the next step was to bring in the second and other imitating voices _successively_, at the same or different pitch; thus making the imitation more prominent. So long as composers confined their efforts to using fixed melodies, they could not go far. When they began to adapt well-known melodies and later to invent their own it became possible to make a lengthy work, this leading to a composition in which each of the accompanying voices imitated the first; sometimes only two voices used imitation, the other having a somewhat free part. A next step was to _vary_ the _imitation_, by changing the motion of the imitating part; if the melody moved up, the imitating part moved downward and _vice versa_; sometimes the movement was reversed, the imitation beginning with the last note of the phrase and proceeding to the first; sometimes it was made in notes of smaller value (diminution), sometimes in larger (augmentation). These and other devices were experimented with and worked out by the Gallo-Belgic composers. One readily sees that this is _intellectual_ work, that it puts a premium on cleverness and lays expression aside. Yet the technic of an art must first be acquired and the composers of this period were doing this in working out a system of technic in composition with Imitation as the foundation.

[Music]

Illustration from Naumann, “History of Music,” page 321, Vol. I, showing at 1 and 2 the principal melody and its imitation, and at 3, imitation and inversion. The student should examine the entire example in Naumann.

=The Work of the Gallo-Belgic School=.—We note that many of the new ideas came into being at this time, all of them, however, tending toward the arranging of material or the preparing of it for the emotional style. The Canon, and the principle of Imitation, developed a set of strict rules which tended to produce more adequate command of material and assisted in shaping the Fugue; though we, in our own day, regard these rules as positively detrimental to the real expression of emotion, yet they were necessary adjuncts to the real command of _technic_. With Imitation came Counterpoint of a more highly developed form; an inevitable step

toward the fugal style of the later polyphonic periods. And lastly came a use of _Folk-music melodies_ and the _Leading Tone_, important because they foreshadow the abandonment of the old Church Modes, and the _adoption of the Natural Scale_. This marks the important point in the Gallo-Belgic school; for with the introduction of the Natural Scale there came increasing tendency for emotional expression, which could never have occurred had the Church Modes retained their former position in music. The idea of this preparation of material for emotional development cannot be emphasized too strongly. Upon the Gallo-Belgic school rested the burden of preparing this material for the later schools, so that these could demonstrate to the world that while polyphonic music could not be surpassed as a means of expressing certain impersonal, almost religious emotions, it could not express to the fullest, the intimate, personal, emotional ideas of the romantic composers.

=The Men=.—The men of this period are more important than any that have yet been mentioned, and for that reason require more detailed study. =H. de Zeelandia= (13—-1370), a native of Flanders, was a teacher and composer, and author of a theoretical treatise with musical examples, “De Musica”; with him the use of consecutive fourths, fifths and octaves almost disappears, though it remained for a later composer to abolish these entirely. =Guillaume Dufay= (1355-1435) was the one to whom this reform must be finally accredited. He used in place of the old church form of Cantus Firmus, the popular melodies of the people with their tendency toward the Natural Scale and the use of the Leading Tone and its decisive tonality; it may be said that these melodies were not used in their entirety, or even in their original form, the rhythm and meter oftentimes being altered so that the airs were hardly recognizable, though the essential parts were there. It is Dufay who is responsible for the first intelligent use of Imitation as a basis for the Canon. =Gilles (Ægidius) Binchois= (1400-1465) was a noted composer and, with Dufay, a joint founder of the Gallo-Belgic school. He is said to have been a soldier before he entered the Church, and must have been of a light-hearted disposition, as he was called “the father of joyousness.” He was the teacher of Okeghem, Firmin Caron and of Busnois. =Antoine de Busnois= (1440-1481) was the last famous master of this school before it was merged into the school of the Netherlands. In his works one can note a further progress in smoothness of style and examples of well managed imitation. The character of the latter is so scholarly and so clearly not a matter of improvisation that we must consider him a man given to study and reflection, just the kind of character to give scientific study to the principle of Imitation.

=The Importance of this School=.—This school occupied only a short period of time (1360-1460), as compared to some of the other schools; but in that time much was done. The material taken from the Paris school was great and capable of being developed, though it was encumbered by unusual intervals and a prejudice against the more euphonious ones, and by a number of obsolete forms; so obsolete, in fact, that with perhaps one exception, the Motet, none lasted until the time of Bach. But the use of Imitation and Measured Music was sufficient for the men of the Gallo-Belgic school, and with this as a foundation, and the constantly-increasing tendency to use the Folk-music and the Natural Scale, they succeeded in so arranging their material that the men of the Netherlands had but to infuse emotion to make it produce great music. Dufay and his contemporaries had done this much: to create organically well-ordered tone combinations agreeable both in melodic and harmonic relations. Both artists and public found pleasure in the many transitions, the free use of suspensions, the altered tones and chords borrowed from other scales, in the ensemble of these methods which did not give rise in reality to chord-relations as we understand them, yet suggested something of the kind, and particularly were they pleased with the use of the variety-giving changing notes. Because the Gallo-Belgic school did not invent new forms, or develop old forms to a high degree of perfection, is no reason why it should not be given a high rank among polyphonic schools, for the process of refining and transition is often more difficult than that of inventing.

Naumann.—History of Music, Vol. I.

Parry.—Evolution of the Art of Music.

QUESTIONS AND SUGGESTIONS.

Why did Paris lose her position as the centre of culture in art?

What did the Paris school contribute?

In what way was Imitation to be valuable to musical composition?

What new methods of Imitation now appear?

What are the important points in the work of the Gallo-Belgic school?

Who were the prominent musicians in this school?

What advance is marked over the work of the Paris school?

The teacher should place on the board an outline of the leading countries of Europe, Italy, France, Germany and the Netherlands, showing the cities concerned in the development of music up to the time of Bach and Handel.

The reader can appreciate that the condition of France and Paris was not favorable to the growth of art at this period, which was one of wars between England and France in the territories of the latter. In 1346, Edward III of England won the battle of Crécy; the struggle was continued for the next hundred years at intervals, when the appearance of Joan of Arc (1412-1431) assisted the French. Monasteries were left unmolested, hence the monks near the Belgian border were able to work in comparative peace and quiet.

LESSON XI.

THE ENGLISH SCHOOL.

=The English Polyphonic School= is at once the least important and the most peculiar of all the schools of the Polyphonic Period. It is usually ignored by the writers on early music, not because there was no musical culture, but because there was not continuous and original development. English writers on this phase of musical development are too apt, through a pardonable pride of nationality, to exaggerate the value of British music, and in consulting such authorities, one should be careful to examine thoroughly all proofs of a dominant national school and discard such statements as are not perfectly authenticated. It is hardly the Englishman's fault that he has had no definite culture which he may call genuinely English, for native composers have had more encouragement in England than usually falls to the lot of a creative musician. Indeed, England has always been a patron of the best in music, native or foreign, and no one nation has, as a whole, been more generous in appreciation; her treatment of Beethoven on his death-bed is a notable example of disinterested generosity. But in real, original, creative art England has had no great past; and especially is this true of the Polyphonic Period.

=A Warlike People=.—This is almost entirely due to her geographical position; there are many other reasons but they are almost all dependent on this one, and so must be treated in a subordinate sense. In her early days, England's position served as a protection and kept intact her wealth of native Folk-music; but with the advent of the Romans and the spread of the knowledge of her natural wealth, came invasion after invasion. Since the first invasion, England has never been at peace; she has either been busily engaged in repelling the enemy from her own shores, or aiding in a conquest of some less fortunate foe. These wars and conquests not only served to cultivate a militant and restless spirit, but also produced a race of fighters from natural inclination. Look at the warlike Angles and Saxons, note the mixture of Romans, Normans, Dutch and Huguenots, all at the zenith of their fighting powers, and then cease to wonder that England's greatness has been in the power to fight, to govern, to make conquests, rather than to cultivate art. England, when she reached the stage of conquering rather than defending, began to give, more than to acquire, and never reached the acquisitive stage until the present time with Elgar and the lesser lights of the new school, unless we except Shakespeare and his contemporaries in the realm of literature. England's cathedrals are but the results of European cathedral building and the unity of Government and Church; had the Church and State always been separate, it is safe to say that England would have waited much longer for her cathedrals.

=The Kindred Arts=.—Literature was the only exception; and it is not necessary to seek for a further reason than the fact that Literature, as an art, always developed before Music. Art, in painting, was in the early days borrowed from other countries, and not until modern times did England acquire a national school of Painting; a noteworthy fact, for like Literature, such an art almost always precedes a national culture of Music. But these examples of the evolution of the kindred arts of Literature and Painting are encouraging rather than discouraging, for, having attained a high standard in these, England may now hope to develop a national culture of Music. In Music much the same conditions obtained as in Literature and Painting. With the exception of one or two isolated composers, and these trained in foreign schools, England always borrowed her music; note for example, Handel, Buononcini, Mendelssohn, to quote just a few noteworthy foreign composers. Each race as it conquered England brought its own music. St. Augustine sang a Gregorian chant as he entered Canterbury; the Normans and the Dutch had their own music; and

Italian and German music long held the boards in England. Thus little time was spent in developing a native music, because the frequent wars and political troubles directed the strength into other channels than those of art; the proximity of a higher culture in Europe, and the tendencies of England's foreign rulers, enabled them to import and subsist on foreign music when they should have been developing a native style. And finally, the isolation of England in the early days, later became an actual help to the acquirement of an alien style, because of the absolute necessity for students to live abroad to acquire musical learning.

=Native Musical Life=.—There was a certain amount of native musical life, but this did not tend to produce music along the conventional lines. Of Folk-music there was much, and the development, as a general rule, was aided rather than retarded by the conquests, though the combination of Folk-music of different nationalities does not usually tend to aid its unified evolution. The only real example of noteworthy writing, in the early polyphonic school, is the canon "Sumer is icumen in," dated 1228, and attributed to an early English writer. There is no proof excepting the fact that the manuscript is in English, that the canon is of English origin; neither is there proof to the contrary. Single instances, however, do not prove the existence of an original school; and especially is this the case when that school, in its writings, far surpasses any other school of that period of which we know. In spite of the fact of the English text, and that this canon may be but one of many surviving the destruction of the English monasteries, impartial historians believe most strongly that the canon is of French origin, reset to English words and carried to England by a student of the Paris school. The Paris school was at its height at this time, and was the only school of such writing in the world; and while we have no other example of that school equal to this canon, yet it is easier to believe it to be French than English, for England had no such school at all. She had musicians (like Odington), but they were all pupils of the Paris school; and even had this work been produced in England, it would be safer to credit it to the Paris school, for the man who wrote it would, almost of necessity, have studied there. The only other way of accounting for it is to presume the date to be too early.

It is but fair to say that while this canon _may_ owe its origin to the principles of the Gallo-Belgic school, it stands alone as an article of historical interest to the musician. Nowhere on the Continent has a work of equal importance of so early a date been brought to view. Mr. Wm. Chappell, the English antiquarian, brought to light several other productions of early English composers, including a hymn in English, scored for two voices, and another in Latin, for three voices. The manuscript has been definitely attributed to the middle of the 13th century. There can be little doubt that when so many monasteries, with their treasures of learning, were suppressed and their inmates scattered, in the time of Henry VIII, owing to the national change from the Romish faith, many valuable manuscripts that would today have the utmost interest to the musical historian were destroyed.

[Music: OLD ENGLISH CANON "SUMER IS ICUMEN IN."]

[Music]

Whether this is purely English or not matters little, for it is a fine specimen and exemplifies Walter Odington's rule for the construction of a Roundel, cited in a former lesson. This is more than a mere roundel, having not only a little Inversion and much Imitation, managed in a most ingenious manner, but also the whole canon is founded on a ground bass in two parts, themselves in canonic form. This bass consists of the regulation metrical form as seen at A and the following two measures, has one measure forming a connecting passage, thus bringing in the portion marked B which is the same as A only a fifth higher; the whole forms a remarkable evidence of an early conception of the relation of the Tonic and Dominant, hardly to be believed. This metrical form is introduced, slightly changed and inverted, in the upper voices at A and B. The first voice states in all five melodies and the other voices follow at intervals of 4, 8, and 12 measures; in ending voice number two omits part of theme V, voice number three all of it and voice number four all of V and the imitation of the metrical bass.

Outside this one example, England produced little but moderately good polyphonic music in the form of motets and madrigals, and in the time of Gibbons and Purcell, sonatas and operas. There were also anthems, the old plain chant and much Folk-music, but nothing that can be considered as important. The Folk-music is all that can claim originality, and that ranks favorably with the best examples of other nations and is, indeed, in advance of that of other nations considered more musical.

=The Men of the Time=.—While English music was not, at this period, very important, there were many composers whose names at least should be familiar. After the passing of the bards and minstrels, the monks controlled the composing of music until the dissolution of the monasteries, when it passed into the hands of the schoolmen of Cambridge and Oxford, where it remains today, though there are, at present, signs of an important awakening, presaging the passing of musical power from the hands of the conservative doctors of Oxford and Cambridge, to the present generation of younger and more talented writers. =Walter Odington= (1180-1250) was a pupil of the Paris school and a theorist of note, writing on the Mensural System as exploited in the French

school. =Robert DeHandlo= (1326) was another theoretician who wrote on the same subject. =John Dunstable= (1400-1458) was contemporaneous with the men of the Gallo-Belgic school and did the same for English music in reforming it as the latter did for the foreign school. In recent years examples of his writings have been unearthed in the cathedral libraries of Trent and Bologna, as well as elsewhere, making it clear that in his lifetime he was regarded as one of the foremost composers of Europe. The theorist, Tinctoris, of the Netherlands school, considered in the next lesson, speaks of the “source and origin of the new art [Counterpoint] being among the English, the foremost of whom is John Dunstable.” A contemporary who was also well-known in Italy was John Hothby, who wrote several treatises on music. There were other musicians of prominence prior to the Reformation under Henry VIII, but we know little about them save their names. =John Merbecke= (1515-1585) adapted the Gregorian chant to the English prayer book, which was published in 1550. =Christopher Tye= (1515-1580) was a teacher and wrote much church music; so also was =Thomas Tallis= (1515-1585), one of the most learned composers of his time, who set the choral portions in the service to music. He is noted for a celebrated canon in forty parts and for a hymn-tune, known as “Tallis” or “Evening Hymn,” which contains a canon between the soprano and tenor parts. =William Byrd= (1538-1623) was another noted composer of this school, being also famous as a writer of instrumental music. Queen Elizabeth granted to Tallis and Byrd the exclusive right to print music and to rule music paper. =Orlando Gibbons= (1583-1625) wrote motets and madrigals and is known as a writer of both polyphonic and monophonic music. =Henry Purcell= (1658-1695) was the greatest composer of the English Polyphonic school, writing operas in the English and Italian style, songs, sonatas, motets and anthems. He seems to have been in many respects a very able writer and musician, but died too young to make any decided impression on his times.

=Summary=.—From this it will be seen that while England had a musical people composed of a mixture of the most musical peoples of Europe, yet because of geographical position, political disturbances, religious troubles and wars, she was never able to produce a great and commanding school. She did not lack force, but it was directed into other, and for the time being, more important channels. Almost everything of an artistic nature was borrowed, or was a transplanted culture; and while the art of music never lacked men to cultivate it, yet these men were not of the calibre of the men employed in the other works of the nation, so that so far as the Polyphonic period is concerned, England is not important, and but for such men as Dunstable and Purcell and the canon “Sumer Is Icumen In,” England might be completely ignored in respect to her influence on polyphonic development.

QUESTIONS.

Why did Music have so uncertain a growth in England?

What is the earliest English composition of value?

What were the causes for the loss of early English music manuscripts?

What principles are shown in this old Canon?

Who were the leading composers in England in the period considered in this lesson?

LESSON XII.

THE SCHOOL OF THE NETHERLANDS.

=The Dominance of the Netherlands=.—The most important asset of a nation is its commercial activity, for upon that depends its art life. The fine arts are to an extent luxuries, and until a nation has, by commercial activity, acquired wealth, they cannot be earnestly cultivated, for all arts require from the artist his entire time and life, and until there is money and inclination enough among

the people to support an artist in his commercially non-productive state, there can be no art; hence we see a shifting of art centres in the Middle Ages, just as the commercial centres changed.

The Netherlands were preëminently fitted to carry on great commercial pursuits by virtue of their geographical situation and long combat and association with the sea. Possessing the natural outlet to a great part of Europe, it was reasonable that the Netherlands should play an important part in the Hanseatic League, and that her fleets should trade on every sea and her coffers be enriched by barter in the produce of every clime. It was a golden age for the Lowlands, from 1350 to 1625, for their trade made them one of the wealthiest and most important nations in the world. Their situation between the trading countries of the South and the North made them, as it were, the commercial exchange of Europe. The consequent wealth could not lie dormant, therefore much of it was used in building notable architectural structures, encouraging Painting, and developing the then infant art of Music. It is unnecessary to mention the famous structures which were the result of this period, and it is but necessary to name Hubert Van Eyck, Rubens, Van Dyck, to understand the prominence given to the art of Painting by the acquisition of this enormous wealth. And it is largely due to this commercial activity that the school of the Netherlands attained such an undying fame.

One other influence, and that dependent on commercial activity, produced great results. Art is not sectional, it is universal; and great art works are produced not by local influences but by association, or contact, with the world. For this reason, the intercourse with the entire world generated by the great commercial activity of the times produced the first great world School of Music. Intercourse developed emotion and produced broader and less localized view-points of life: it brought into close association the art life of different nations and infused a unity of emotion wherever it occurred. In short, Music, by being brought into contact with the ideas of the world instead of a local association, took on a universal form and feeling never before felt and never to be relinquished. For this reason, Music unconsciously advanced from Paris to the Netherlands, toward the greater sphere of influence, stopping for only a short period with the Gallo-Belgic school, where it was prepared technically for its new growth as a world form.

=The Gallo-Belgic and the Netherlands Schools Compared=.—The Gallo-Belgic school, in the control of churchmen, was isolated from any influence tending to develop a broad emotional scheme. And it is doubtful whether it could have caused any change in musical evolution, for the technical forms were not ready. And so the Gallo-Belgic school, in its retirement from the great world activities, confined itself to attaining the power to manipulate notes, for the sake of mere technical effects, leaving emotional development entirely out of consideration. With such a school, while its work was important, no real art feeling could be gained; and so the school of the Netherlands marks the departure into a new romantic school governed, to a great extent, by the emotional. The Netherlands, because of their more comprehensive view of the musical activities of the past and their constant intercourse, commercially and artistically, with all nations, acquired a more human sense of the beauty of music, and ceased to manipulate musical material for technical ends, producing instead of cold, lifeless forms, music pulsing with vigor, life and emotion. With this primary change of view-point came a direct growth of form, the Canon being perfected and immediately giving birth to the Fugue; the Madrigal and Canzona and many other lesser forms sprang into being, all capable of emotional development, and almost immediately producing great results. For the first time music was free from consecutive fourths, fifths and octaves because composers created from the standpoint of emotional beauty and not that of technical utility. The result was a musical technic capable of development, and refined beyond need of further reformation.

=The Organ and its Influence=.—The organ was the third great reformative power in this epoch. All music was vocal and no other conception could be had, for effective instruments and instrumental music were not yet in existence. The organ, because its tones were suited to accompanying the human voice and because its tone color was closely identical with that of the voice, was readily adapted to the vocal forms then in use. This gave a greater resource, for what was often technically impossible with the human voice became easy with the organ. The mechanical improvement of this instrument immediately gave greater freedom and range of technic, and it proved so well suited to polyphonic development that it aided the evolution more than any other one agency. The use of the organ must not be accounted as the beginning of instrumental music, for the organ used only adapted voice-forms, such as the Canon, Fugue, Madrigal, etc.; for this reason it is to be doubted if it aided in emotional development except by making technical resources much less restricted. In this sense, then, the technic of this school was freed from most of its former rules, and Music, previously cramped by narrow vocal restrictions, passed into the comparative freedom of the polyphonic style of the organ.

=The Men of this School= are hardly to be separated from the men of the Gallo-Belgic school. The work passes from one school to the next with little or no perceptible pause, and the first men of the later school are pupils or disciples of the last men of the Gallo-Belgic period. Another noteworthy fact is, that so great was the musical growth, of this school and the skill and learning of its followers that the composers of the Netherlands expatriated themselves and settled in all parts of Europe, founding famous schools in Paris, Madrid, Naples, Venice, Munich and Rome; the celebrated _Italian school_ is really an _offshoot_ of that of the

Netherlands. It is this overflow which marks this school as the greatest of the early polyphonic schools and shows why and how it acquired its emotional supremacy. =Jean de Okeghem= (1430-1512), pupil of Binchois, was the first prominent worker. It is difficult to class him as a composer of the Belgian or Netherlands school, for he has the earmarks of both. He lived during the supremacy of the Netherlands, but worked with the material of the Belgians. He developed the Canon to its highest technical point and took the first step toward the originating of the Fugue. To him is due the credit of introducing the use of retrograde, inverted, diminished and augmented imitation in the Canon. Much of his work was done in France. The tendency of his teaching was toward artificiality, as he delighted in puzzle canons and other exhibitions of ingenuity.

=Antonius Brumel= (1460-1520), a pupil of Okeghem, is noteworthy because of a foreshadowing of the use of chords in real harmonic progressions.

[Music: 8ve lower]

Part of a motet by Brumel, Naumann, History of Music, Vol. I, page 333, used to illustrate the idea of the harmonic feeling of some of the polyphonic writers. The rest of the composition is strictly in the polyphonic style.

=Jakob Hobrecht= (1430-1506) was the first real Dutch composer, and is noted, in his use of technical forms, for their emotional beauty rather than mechanical excellence.

[Music]

Part of a composition by Hobrecht, cited by Naumann, “History of Music,” Vol. I, page 331. Excerpt shows how strictly even this fragment is written and yet how musical it is. At 1 is shown a figure in the bass repeated in imitation a step higher at 2. At A is shown a melody imitated at B in augmentation and with altered rhythm. The student should refer to Naumann.

This is truly a remarkable work for that period, and shows that even then composers were beginning to observe the emotional power of chord relationship.

=Johann Tinctor= (1446-1511), a disciple of Okeghem, worked in Rome and Naples, and will be considered with the Italian school. =Josquin de Pres= (1450-1521), also a disciple of Okeghem, worked in Rome and Paris, and must also be considered as one of the Italian school. It may be here mentioned that he was one of the first to use music as a vehicle for expressing human emotions rather than technical power. He summed up in himself all the harmonic science of the 15th century. He was renowned through all Europe as a composer, and if his music seems to us somewhat dry and pedantic there is abundant testimony to the deep impression it made upon his contemporaries, which is a test of its power to excite and to express emotion. Compared with the works of his predecessors and even the majority of his contemporaries, Josquin’s writings show freedom from the bonds of the old scholasticism, greater simplicity and esthetic beauty. Among those of his works that have come to us is a _Miserere_ for five voices, and an _Ave Maria_ that cannot be considered other than lovely music. =Nicholas Gombert= (1495-1570), a pupil of Josquin de Pres, had a natural, tuneful and flowing style similar to that afterwards shown by Palestrina. His work was done in Madrid, and to him Spain and Portugal owe all they have of the ancient polyphonic music. =Jacob Arkadelt= (1492-1570) and =Claude Goudimel= (1510-1572) worked in Rome, =Adrian Willaert= (1480-1562) and =Cyprian de Rore= (1516-1565) in Venice, and will be considered with the Italian school. =Orlando di Lasso= (1520-1594) worked some in Italy, but mostly in Munich, where his influence was great. His style was broad, flowing and especially emotional, and as a writer of the Netherlands school his name stands as one of the very highest. =J. P. Sweelinck= (1562-1621) is the last, and while of the Netherlands, studied in Venice, but did his work at home. He was a great organist and the last great master of the school, and had the honor of being the link between it and the German school, serving as an example for Sebastian Bach. His works have recently been published in Germany. Of all these men it may be said that they developed music steadily toward the goal of emotional freedom.

=Summary=.—The great work of this school was to make _technic subservient to thought_. In all preceding schools, the material and the forms were so new and the methods of handling them so crude, that technic always dominated thought. And it was naturally so, for expression cannot come until the power to master the material has been attained; it was by this power that the Netherlands developed emotional music. But the student invariably objects and says he does not see any emotion in the polyphonic music of this period! The student must place himself in the position of these old masters, supported by the church and constantly imbibing the religious atmosphere of the institution they served, until they unconsciously expressed, in their music, the grandeur and power of their religion rather than the intimate personal feeling of modern musicians; and then the student will understand what is meant by polyphonic emotion. We must always remember that _polyphonic emotion is not monophonic

emotion_, and that its tremendous technic and complexity of device were but the means of expressing its peculiar form of emotion, which to understand, one must study diligently, and then approach with a reverent feeling.

QUESTIONS AND SUGGESTIONS.

Why did the Netherlands become the musical centre?

How did geographical situation favor the Netherlands in the struggle for commercial supremacy?

What circumstances gave their art a general rather than sectional character?

Compare the Gallo-Belgic and the Netherlands schools.

How did the Organ aid in development?

Who are the most famous members of this school of composition?

What are the special characteristics of each?

What is a _Miserere_?

What is an _Ave Maria_?

What was the Hanseatic League?

What was the contribution of the Netherlands school?

Consult a general history for the events which made the Netherlands so important at this time.

In selecting a historical epoch to accompany the period of the Netherlands school and its successor, the Italian school, the central figure that will be most familiar is Christopher Columbus, whose life and work covered the early period, the close of the old polyphonic school dating with Palestrina's death in 1594, 100 years after the discovery of America. This hundred years represents the flowering time of polyphony as an art.

LESSON XIII.

THE ITALIAN SCHOOL.

=Italy the New Centre=.—Music developed in the Netherlands because of commercial supremacy and the consequent world association. We shall now see it pass to Italy, but because of a very different reason. From the earliest Christian days Italy was the centre of religious influence; it is only necessary to examine history to observe the ramifications of that power in England, France, Germany, the Netherlands and other countries. This influence, often more political than religious in character, gave to the Italian Church (then the Italian State), a predominance of authority, which was a great power in religious and secular thought. This influence spread to music for various reasons. We must remember that the school at Paris was controlled by the Church, that the Gallo-Belgic school owed its foundation to the same cause, and that the men of all three schools were employed as organists by the Church. It is true that in Italy the Church had not the broadening influence of commercial intercourse, but was more than compensated for that lack by what we may call artistic intercourse. The Church was the one stable institution in these times of war in which painters could find a refuge for their works, and from which patronage flowed in a steady stream to the ever-needy artists. Thus was caused and maintained the artistic atmosphere necessary to the cultivation of Music. As an art, the Church was the only

support of artistic music. When Music originated it needed an institution to protect and foster it and safeguard its growth, and this it found in the Church; it repaid this protection by evolving a style eminently suited to the needs of the Church, but absolutely useless for the expression of secular and natural emotion. To this patronage of its peculiar art is due the importation into Italy of the best in music wherever found, to aid in these services. And so we find singers from the Netherlands engaged for the Church in Italy. This, and the fame of Italy as the home of superior singers, undoubtedly led the majority of those numerous Netherlandish masters to seek their homes abroad, and preferably in Italy. The fact that all music was vocal in style and that the Church was the only institution capable of supporting such a style, cannot be too strongly stated; for upon that depended not only the evolution of Music, but also the very life of the Polyphonic emotional style.

=Emotion in Polyphony=.—This style is worthy of examination. As a preface we must remember that we have to deal with the Church and _human voices only_, for instruments had not been perfected sufficiently for church use, excepting the organ, and that we must consider a voice because of its peculiar tonal qualities and the adaptation of vocal forms and styles to its use. This vocal style had developed gradually, through a long course of reforms, until it reached its perfection in the later polyphonic schools, and expressed the peculiar emotion suited for the services. _Lack_ of _rhythm_ was a pointed _characteristic_; for, in the first place, it had been discarded as profane, and in the next place, a long course of treatment in the management of voices to avoid anything like concerted and accentuated dissonances had produced a peculiar flowing movement which, however smooth it might be, certainly possessed no rhythmic force. Then, too, the old scale forms caused anything written in their idioms to sound grave, severe and dignified, if not harsh. The transition to the modern major and minor in the Monophonic school of 1600 and the immediate cultivation of music by the people may be taken as an example of the musical qualities of the two modes. All of these causes tended to produce a suitable form of music and an emotional expression peculiarly suited to the Roman services. In this style there was little storm and stress, little of the personal appeal to God; on the other hand, it was grave, severe and immovable, or in a better sense, impersonal in its expression. Music of the polyphonic period, even until the time of Sebastian Bach, in whose works it is well exemplified, does not show us the appeal to God from the heart of the active Christian worker, but rather the appeal to a vast impersonal and majestic God far removed from the needs and supplications of the mere individual. It was this kind of emotion that developed in the Italian Polyphonic schools. The human and more expressive emotion of the schools of the Netherlands was transmitted, in the schools of the Italian, into the high, contemplative moods of religious expression; and it was well that it should be so, for polyphonic music could never have expressed the emotion of a Beethoven; and it was not only best that it should express its own peculiar style of emotion, but inevitable that it should do so.

[Illustration: ORLANDO DI LASSO.]

=Schools Outside Italy=.—The overflow from the Netherlands concentrated its efforts on certain points or school centres. In Italy, these were Naples, Venice and Rome. There were others throughout Europe, such as Madrid, Paris and Munich, which we must consider first because of their relation to Italy. =Nicholas Gombert= (1495-1570) influenced the polyphonic development in Madrid, but so isolated was the work that nothing great resulted. =Okeghem= (1430-1512) worked longer in Paris than other masters, though several lived there for short intervals, such as Arkadelt and Goudimel. =Orlando di Lasso= (1520-1594) did almost all his work in Munich and established the most important school outside of Italy. He was a most prolific writer and can be compared in ability and style to Palestrina. His style was broad and bold and contained much of that serious and earnest character now attributed to his Teutonic associations. He wrote in all known forms and was well nigh universal in his knowledge of form, technic and expression. His facility in the art of writing was very great and was fully equalled by his love for work. Although his work has somewhat less perfection than that of his great contemporary, Palestrina, it has astonishing power of expression. It shows the force of his genius that he was able to make his works in the strict contrapuntal forms full of real feeling. He was a man of interesting personal character. The most famous of his works is his setting of seven “Penitential Psalms,” containing a number of most curious effects for unaccompanied voices, with much that is singularly characteristic and beautiful, and showing well the character of his genius.

We give part of a composition by di Lasso showing his broad style and the increasing use of what sounds suspiciously like our modern chord progressions. The lack of rhythmic effect and the holding over of notes past the accented beat is shown in this exercise. The whole example, with words, may be found in Naumann, History of Music, Vol. I, page 387.

[Music]

=The Italian School=.—But it is with the Italian schools that we are most concerned. The school at Naples had as its principal master =Johannes Tinctoris= (1446-1511) a Fleming by birth, a doctor of laws and a mathematician, one of those peculiar

combinations seldom noticed after the Paris school, and almost sure to mark the theoretician. His work was principally theoretical and his treatises are of great value. =Adrian Willaert= (1480-1562), born at Bruges, was a pupil of Jean Mouton, at Paris. After visiting Rome and Ferrara, he settled in Venice and, as organist of St. Mark's, founded an important school. He introduced the use of large double choruses which caused him to write harmonically rather than polyphonically. This influence caused him to relegate the imitative polyphonic part writing to smaller forms (motets, etc.) and to write plain chord progressions in his larger works; and before long he began to observe and to use the relationship between the Tonic and the Dominant. This tendency and the invention of the Madrigal furnished the basis for a new instrumental school at a later date. His best-known pupil, =Cipriano di Rore= (1516-1565), was short-lived, and worked in both Venice and Parma. He made some investigation into the use of chromatics, thus showing the growing tendency to abandon the Church modes for the natural scales. Following these Dutch masters came the two Gabrieli's, who were native Italians. =Andrea Gabrieli= (1510-1586) was a great organist and wrote in the style of Willaert, his famous master. =Giovanni Gabrieli= (1557-1613) was a pupil of his uncle Andrea, and carried the latter's methods further toward perfection. He also wrote for instruments in conjunction with voices, abandoning to a certain extent the _a capella_ style, and opening that epoch of instrumental music foreshadowed by Willaert in his madrigals. Rome was the centre of church government, of church art and also of church music, and as such, had the largest and greatest of Italian music schools. =Jacob Arkadelt= (1492-1570), a Netherlander, lived nineteen years in Rome and did most of his work there; he wrote both secular and sacred compositions in the strict polyphonic style, and in that of Willaert. =Claude Goudimel= (1510-1572), though a prominent master in Paris, worked much in Rome and was the teacher of Palestrina. He set to music in four parts metrical versions of the Psalms, published in 1565. In him is to be observed that clearness of expression and beauty of melodic flow with which Palestrina attained such a high point of expression.

=Palestrina=.—It remained for his pupil =Palestrina=, (Giovanni Pierlugi Sante, 1514-1594) an Italian, to reach the highest point of emotional expression and technical freedom; we must, however, rank Orlando di Lasso with him. He carried to the highest fruition the teachings of the Netherlands, tempered by the romantic and melodic tendency of the Italian nature. His writings were so free technically that they have been called simple in form; this they are, but the simplicity is the simplicity of genius. His style is melodic, and has a clearness never attained by any writer before his time, and yet his music is written in the most severe forms. He founded a school of music in Rome which, however, never produced any great masters, for it was the time when the reformation of Opera began and carried the development of music into other channels.

[Music: SOP. ALTO TENOR BASS]

The end of a composition by Palestrina, showing the melody in the upper voice instead of the tenor, as was usually the case in polyphonic compositions, and the use of our modern Minor mode. This composition, at least this last part of it taken alone, might be by a modern writer, so familiar do its progressions sound; indeed, the melody of the first two measures is strikingly similar to a progression used by Beethoven in one of his string quartets. The entire example with words may be seen in Naumann, History of Music, Vol. I, page 510.

=Summary=.—The Polyphonic Era has many important characteristics and results which make it worth while to sum it up. Its development is largely the history of the _development of vocal music_ to its highest point, and the consequent failure of it to provide accurate expression for human needs. It marks the development of scales, intervals, forms, instruments and emotion. In scales we find the trend to be always toward the natural; in intervals, toward freedom, using only the ear as a criterion; in instruments we note the development of the organ, but the lack of others which would have changed music entirely; in emotion, we note the evolution from crudeness to the highest and most polished forms of impersonal expression. The lack of the Polyphonic school was not in the intrinsic value of the music, nor in any lack of the desire to express emotion; the failure to provide a suitable means of musical expression was due to the idea of church relation to God rather than to the personal individualistic relations established by Luther. _After the Reformation_ music takes up this new idea and immediately a _secular music_, vocal and instrumental, begins to _develop_, culminating in an emotional school of a totally different and truer style than the Polyphonic. Polyphonic music expressed the old monkish ideas of religion perfectly, but monophonic music expresses the emotion of the people, a universal emotion. Polyphonic music must always be appreciated for its value, but it must be examined for its fundamental principles and reasons for being, before it can be understood. Then we may know its value as a foundation for our modern music.

QUESTIONS AND SUGGESTIONS.

Why did the centre of music shift to Italy?

What kind of emotion is present in the polyphonic style of music?

What composers were prominent outside of Italy?

Name the prominent composers of the Italian school.

Sum up the Polyphonic Era.

Consult a history of art and give an account of the great painters, sculptors, architects and their greatest works during the century preceding the development of the Italian school.

LESSON XIV.

PALESTRINA AND HIS INFLUENCE ON THE MUSIC OF THE ITALIAN SCHOOL. THE MADRIGAL.

[Illustration: PALESTRINA.]

=A Church Composer=.—But one master of the Italian Polyphonic schools is worthy of lengthy notice, more because of his influence on the music of the Church than his contribution to the new instrumental school then only in its infancy. Palestrina, while acquainted with Galilei, the reformer of Opera, and Neri, the originator of Oratorio, and with many of the men identified with the new style of vocal and instrumental music, gave his entire life to the composing of Church music, though in his poverty-stricken condition musical work under wealthy patronage must have often appealed to him. At any rate, the farthest he ever strayed from the Church was in the composing of many madrigals, in which he excelled; it is almost certain that in these he unintentionally influenced the development of instrumental music. For the present, however, a consideration of his life and influence on Church music is more important. But for him, Church music would have lacked for at least a century that simple and individual note so often struck by himself and Bach. Palestrina, by the enormous number of his masses and by the fertility of his invention, placed the music of the Latin Church on so high a plane that no composers, at least until the time of Bach, even approached him, much less equalled him.

=Giovanni Pierluigi Sante=, known as Palestrina, after his birthplace, was born in 1514 at Palestrina, a small town southeast of Rome. His parents were peasants and the boy received but the ordinary education of his class. While very young he seems to have become a choir-boy at Rome, though it is recorded that his voice was anything but pleasing. Upon this supposition rests the statement that he was, for a short time, a pupil of Arkadelt; this is unimportant because eventually (1540) he became a pupil of Goudimel, whose influence far overshadowed that of any former teacher. In 1548 he married and four sons were the result of the union, three, however, dying at an early age and the fourth proving, in after-life, a worthless fellow. In 1551 he succeeded Arkadelt as choir-master of St. Peter's; later the dedication of three masses to Pope Julian III won him a position as singer in the Papal Choir. Owing to the jealousy of the other singers he finally lost his position, but received an appointment at the Church of _Santa Maria Maggiore_ where he stayed for ten years. Naumann says that in 1565 he received the appointment of master of the Sistine Chapel, but never occupied the position because of the opposition among the choir. Grove, however, says that in 1565 he was made composer to the Pontifical Choir and did not become master until 1585, holding the position from that time on. In 1571 he was again connected with St. Peter's; this also marks his acquaintance with Neri, for whom he wrote some music, and the founding of a music school, though it cannot have amounted to much since most authorities give no particulars in regard to it. Indeed, it is certain that he cannot have had much influence in that line, for his pupils, outside of his own family, did not amount to more than a scant half-dozen. In 1576 he was given the task of revising the Gradual and Antiphonary of the Latin Church but, with the assistance of a pupil, finished only a little more than one-half of the work. He died in 1594 and was buried in the Vatican. His life is marked by the usual jealousies and quarrels of musicians, though Palestrina himself seems to have been nobleminded and more than reasonably free from all such faults. He was in poor circumstances during his life, and his only living son was a bitter disappointment. Altogether, as we examine his life we are impressed by many things; first, his apparent failure from a worldly point

of view; secondly, the enormous amount of composing which he did; and, finally, his devotion to the Church and her music, and because of it, his glorious success as a musician, and his undying fame.

=Reform of Church Music=.—The year marking the climax of his life was 1565. The Council of Trent, by a unanimous vote, decided to prohibit the use of music in the Church unless some means could be devised to make it more devotional and suited to its purpose. Naumann says that it was the desire of the Council of Trent to simplify the music so that the people might take part in the services; but Grove claims that it was because of the use of secular music in the composition of the masses. It seems that it was customary, for part of the singers at least, to sing in services not only the _melodies of_ the _popular songs_, but _also_ the _words_, thus producing confusion and defeating the very purpose of the music. In all probability, both of these reasons had something to do with the edict. It is plain that the fundamental principle at stake was the lack of the personal devotional note (which caused this action by the Council of Trent), and it was the supplying of this want that made Palestrina the saviour of music in the Church. A committee of Cardinals was appointed to see if proper music for the service could be found. They commissioned Palestrina to write a mass and submit it for trial. When the trial came, at the home of Cardinal Vitellozzi, Palestrina submitted three masses, the last of which was the best; this he afterwards called the “Missa Papæ Marcelli.”

=Palestrina’s Style=.—In these masses Palestrina had succeeded so well in subordinating technic to expression, and in eliminating all extraneous matter, that he was hailed as the greatest musician of the Church, and honors were showered upon him. From this it would be supposed that Palestrina had shown an entire change in style, yet this was not the case. Goudimel, his master, shows traces of the so-called Palestrina style, and Palestrina himself was gradually growing into that simplicity which marked the music of his later days. This simplicity was not only simplicity of emotion but also simplicity of technic; only a man with a most consummate skill could have written such great music with such little use of showy technic. Palestrina wrote in all of the polyphonic forms, complex and simple, but he reached his highest point in his most simple works; and those works were written for his Church.

=Secular Art Song=.—The secular life of the 15th and 16th centuries, as well as the Church, had an art music, which, like the other music of the period was _vocal_, not solos with accompaniments, but _choral_, consisting of three or more parts; this we may call a species of vocal chamber music. We can trace the development of this form of musical composition to an application of the principle of Discant to secular or Folk-melodies. The minstrels, as mentioned in a previous lesson, were accustomed to improvise accompanying parts to a familiar song—a favorite custom was that of adding two parts—for the entertainment of their hearers. This process was not a haphazard one, but followed fixed rules. The absence of a simple system of notation, however, prevented the accumulation of musical records. And when minstrelsy ceased to exist as a calling, only the memory of the crude attempts of the minstrels remained. But the principle was not lost. Fortunately for the good of the art, the trained musicians of the Church took it up, and, calling to their aid the resources of their art as used in the music of the Church, applied them all to secular melodies, the songs of the people.

=The Predecessors of the Madrigal=.—Several of the forms of secular music found in Italy, the Frottole (song of the mass or crowd), and the Vilanelle (village or peasant songs), were used in a crude way by the musicians of the people as airs to which to add accompanying parts. Both Germans and English made similar use of their folk melodies. But since the text was usually of a humorous, or a witty character, the accompanying melodies or “_counterpoints_” were simple in style. The work of the trained composers along this line resulted in the Madrigal, which shows a union of the musical spirit of the people with the finest poetic art; the melodies had the style of the popular music, but they were used with technical skill.

=The Madrigal=.—The text of the madrigal was erotic in character, representing the emotions of a heart filled with noble, often hopeless love. The Italian poets Tasso and Petrarch were masters in this style of writing. The name Madrigal was first applied to this kind of lyric, and afterward became identified with the music itself. There is disagreement as to the origin of the name, the common explanation being that it comes from the word _mandra_, a sheepfold, _mandriale_, shepherd, in allusion to the frequent pastoral character of the text. The Madrigal undoubtedly owes its origin to the composers of the Flemish school. The musicians of the Netherlands, in the middle of the 15th century, had a polyphonic song, elaborate in construction, in the old Church modes, modeled doubtless on the plan of the Motet, but using the melody of some popular song as a _Cantus Firmus_. When the centre of musical power was transferred to Italy, the madrigal principle came into new hands, those of the composers of the Venetian school, who gave it the character which made it so popular.

=The Italian School=.—The first great composer in this style was Adrian Willaert. After him came Arkadelt, who published several books of madrigals. The most famous composer of madrigals was =Luca Marenzio= (1560-1599), called by his contemporaries “the sweetest swan of Italy,” whose works attained extraordinary vogue. They are extremely melodious. A composer who made

considerable use of the chromatic element was =Gesualdo=, Prince of Venusia (1560-1614). Other Italian composers of madrigals are Festa, Palestrina, Anerio, Waelrant, Orlando di Lasso, Cipriano di Rore, Vecchi and Gastoldi, the latter being credited with the introduction of the “Fa, la.”

=The English School=.—The Madrigal never displaced the Folk-song in Germany or the _Chanson_ in France, but it found a home in England, in which country a number of composers were developed whose best work is considered to be superior to that of their Italian predecessors. The period of fifty years, beginning with 1588, when the first collection of madrigals was published in London, is called the Madrigalian Era. The composers of prominence are: William Byrd, Thomas Morley, Thomas Weelkes, John Dowland, John Wilbye, Orlando Gibbons and Richard Edwardes. So great was the interest in this class of music that it was considered a necessary part of the education of a gentleman that he should be able to sing, when requested, a part in a madrigal, as we learn from a work or music study published by Thomas Morley in 1597.

=Characteristics of the Madrigal=.—The best means of securing an understanding of the Madrigal style is to study good examples, and, if possible, to hear them sung by a good choral organization. They are written in three, four, five and six parts, the five part being the one most favored. The principle of construction is _polyphonic_, imitation being freely used, cross accents being frequent on account of the syncopated style, each part being conceived as melody, not as the result of the movement of successive chords.

=Influence of the Madrigal=.—The great number of madrigals written by so many composers may be taken as an indication of the growth of musical sensibility. The creative side developed. The composer was no longer contented with taking a melody or some theme ready made, and elaborating it or accompanying it; he _invented_ his own themes, thus opening the way to the idea that each text should have a theme to suit its special character, a principle which rules in modern music. Since the themes thus took on greater significance, it became important that accompanying parts should not obscure them by over-elaboration; hence the counterpoint used became clearer and simpler, and therefore more artistic. Another fact of great significance is that frequently the madrigals were played by viols, instead of being sung by voices. Composers marked the pieces as “Apt for viols or voices.” It was also customary to sing one part and play the others on instruments, the design being to cause the melody to stand out more clearly; this aided in developing a feeling for the solo with instrumental accompaniment, a fact of great significance in preparing the way for the opera.

=Petrucci=.—Music owes a great debt to =Ottaviano Petrucci=, who is credited with devising a method for printing music from movable type. He was born in 1466, died in 1523 or shortly after that date. Before he began his great work all music was written out by hand, a fact which necessarily interfered with its circulation; the works of the great writers were jealously guarded and students had small chance to profit by the work of experienced composers. Petrucci and his successors changed this. In 1501, he printed a collection of ninety-six pieces in three and four parts by Isaac, Josquin, Hobrecht, Okeghem and others; in 1504, a collection of eighty-three motets for four, five and six voices. By the time the composers of the Venetian Madrigal school appeared on the scene, printing processes had been improved and spread more widely; thus their works could be circulated freely and made popular. We who know the tremendous power of the printing press can appreciate the new force in the development of music inaugurated by Petrucci in the early part of the 16th century.

QUESTIONS AND SUGGESTIONS.

Who was the most important of the earlier composers for the Church?

Give a sketch of his life.

What did he do for the music of the Church?

What peculiarities marked his style?

Give a brief résumé of the Council of Trent. (Consult a general history or church history.)

What attempts at part music did the Minstrels make?

Who took up this work later?

What is the origin of the word Madrigal?

Name some composers of Madrigals in Italy.

In what other country did the Madrigal take hold?

Name some of the composers in that country who cultivated the Madrigal style.

Name some characteristics of the Madrigal.

What influence did the Madrigal exert?

Who invented printing music from movable types?

If the members of the class cannot sing a madrigal or there is no choral society at hand that sings them, a string quartet can play the parts, or any combination of instruments that can represent the necessary four, five or six parts; two or four players at two pianos can give some idea. Novello & Co. publish in cheap octavo form many of the finest madrigals by the Italian and English composers. The members of the class should sing or follow the playing of each part of at least one madrigal and note its essentially melodic character. This class of compositions will also give an idea of the character of the old Church motet and the methods used in the masses.

LESSON XV.

MUSICAL INSTRUMENTS.

=Classification of Instruments=.—The means for the production of musical sound are few in number, and of such universality and antiquity that we cannot say when, how, or by whom they were invented. Modern skill has not added one new means, but has simply improved the contrivances by which musical sound is produced. We can, however, trace the evolution and growth of the various instruments with considerable accuracy, and to this end it is of the utmost importance to have a clear understanding of the principles upon which musical instruments are constructed, in order to avoid bewilderment among the endless variety that have been and are yet made. All instruments may be divided into three general classes: Percussion Instruments, Wind Instruments, Stringed Instruments.

=The Percussion Instruments= are the instruments of rhythm. In this class are included all instruments used for this purpose. It is universally admitted that rhythm is the very basis of music, without which it is vague and meaningless. Possibly the physical fact that lies behind rhythm is the tendency of all repeated muscular action to become regular; witness the blows of the hammer on the anvil, or the carpenter driving in a nail. The psychologic reason is that when the will has set a certain muscular action in motion, it leaves the carrying out of the command to some subordinate function, so _long as it is continuous_; but if the continuity is to be interrupted, the will must again exert itself; hence, drumbeating and rattle shaking must of necessity be rhythmic. Nearly all savages have dances of various kinds. Varieties of drum rhythms arise from the almost universal custom of accompanying dances with drums and rattles.

=Varieties of Percussion Instruments=.—Percussion instruments are almost endless in variety. The most primitive example is that of a hollow log beaten with a war-club by some prehistoric savage. The next step leads to the hollow gourd or other hollow body, across the open end of which is stretched the dried membrane of some wild animal. From these descend all the long line of drums of all sorts, ending with the modern orchestral kettle-drums (tympani) which, by means of a mechanism for changing the tension of their parchment heads, may be tuned in various keys. Percussion instruments of metal are of very ancient origin. In this category are included cymbals of various sizes and shapes, gongs of all sorts, and later, bells and triangles. Comparatively few of the percussion instruments emit sounds of any definite pitch. They were and are to a great extent noise-producing, used for the purpose of marking rhythms.

=Wind Instruments: Vibrating Column of Air in a Tube=.—The next step in advance of noise-producing instruments is the discovery of means for the production of musical sound, which differs from noise in the possession of _definite pitch_. This leads to a consideration of the wind instruments that produce sound by means of a vibrating column of air enclosed in a tube. This is an important class and has several subdivisions, as will be seen. The simplest form of the wind instrument is the plain tube, producing a single sound when blown across the top. A series of such tubes fastened together side by side constitutes the _Syrinx_ or Pan's pipe, an instrument known over all the world from the remotest ages. This is thought to be the instrument mentioned in Genesis with the Hebrew name _Ugab_—translated _organ_, in the verse: "Jubal was the father of all such as handle the harp or the organ." It is generally believed by scholars that the =Pandean Pipe= or =Syrinx= is the oldest of musical instruments; but long before a sufficient advance had been made to bind together several reeds giving different sounds, the discovery was made that sound might be produced in this way. Some prehistoric man found it out, perhaps by blowing across the top of a hollow bone. A whistle of this kind, of prehistoric make, bored from one of the bones of a reindeer's foot, was found in a bone cave in France. It may have been used as a signal, and we may imagine that it may have guided a troop of palæolithic hunters in the chase of the mammoth or rhinoceros, when these animals still roamed over the plains of Europe.

=A Tube Pierced with Holes=.—The next advance was the discovery that one tube could be made to give several sounds by piercing holes in it. The effect of piercing is equivalent to shortening the tube; thus the =Flute= came into existence. There are three forms of the flute; the simplest is the old Japanese flute, blown at the end and pierced with a few holes. Next, the endless variety of flutes blown at a hole in the side, hence called the cross flute, or _Flauto Traverso_, in German, _Querflöte_. A perfect series of these flutes may be made. From the piece of bamboo with three or four holes, up to the exquisite workmanship and musical possibilities of the orchestral Boehm flute, all these flutes are identical in principle. The third kind of flute is blown at the end and is furnished with a diaphragm, which directs the air in a thin stream against the edge of the opening. Flutes of this kind were once used under the names of =flageolet= and =recorder=. Their chief interest lies in the fact that they have served as the model for the flue pipes of the organ, from the ponderous thirty-two foot Diapason to the half-inch extreme of the Mixture.

=The Tube with a Reed=.—The next subdivision is: The tube in conjunction with a tongue or slip of cane, called a reed. Reed instruments are further divided into _single_ and _double reed_ instruments. The double reed instrument is of great antiquity and widely known. This is the instrument generally meant by the term "flute" in the ancient Greek authors. It is known in China and Thibet, and in its modern form as =Hautboy= (oboe), =English Horn= or =Bassoon=, is an important member of the modern orchestra. The beating or single reed is so-called because it is made a little larger than the orifice over which it is fixed, and therefore beats against this orifice at every vibration, closing it and causing the air to be emitted in puffs. This form of reed instrument is also widely distributed. By the Greeks it was called the Berecynthian pipe; in modern Egypt _Arghool_, in early England the Shawm, which is a corruption of an older French name—_Chalumeau_. Under the name =Clarinet= it is another important member of the orchestra. The beating reed also furnishes the model after which the reed stops of the organ are constructed.

=The Tube with the Lips of the Player=.—The last subdivision is the tube in conjunction with the lip of the performer, the lips assuming the rôle of the reed. Countless varieties of =trumpets= have been used from time immemorial, made at first from that natural tube that has given them their generic name, the "horn" of the ox or goat or antelope. The forms of the horn are endless, but from the conch shell of the Japanese or the ram's horn _Shofar_ of the Hebrews to the perfectly tuned and mechanically perfect instruments of our bands and orchestras the series is complete, and the acoustic principle in all respects identical.

=Stringed Instruments Played by Plucking=.—The stringed instruments are those which depend for their sound upon the vibration of stretched strings. This class of instruments is of very ancient origin. As in the case of the wind instruments, the discovery of the principle of the vibration of a stretched string was probably accidental. The twanging of a bow-string suggests a possible clue, or the membranes of animals used for any purpose in which tension is required. Earliest among stringed instruments are the various forms of =Harp= or =Lyre=, in which each string gives a single sound, and is put in motion by being _plucked_ by the finger or _struck_ by a rod or flat strip of wood, ivory, etc., called a _plectrum_. In the next class are included those instruments that are furnished with a neck or fingerboard, with or without frets. In this class the strings are comparatively few in number, as many sounds may be obtained from each string by altering its length by the pressure of the fingers on the neck. These instruments are also played either with the fingers or the plectrum; to this class belong the =Guitar=, =Lute=, =Mandolin=, etc.

=The Lute Family=.—For many years, until displaced by instruments of the violin family, the =Lute= occupied the foremost position among instruments. It was a favorite instrument in the East, whence it reached Spain and lower Italy. During the 14th century, it spread over all Europe, retaining its popularity from the 15th to the 17th centuries. In shape it was similar to the mandolin of the

present day. It had, however, a far greater number of strings. Five pairs of these and a single melody string lay over the keyboard, while the bass strings (finally five in number and used only as open strings) lay at the side. More elaborate forms of the lute, owing to improvements in the arrangement of the bass strings, were the =Theorbo= and the =Archilute=. For the various forms of the lute the ordinary measured notation was not used, but _special letters_ or figures were given to indicate, not the pitch of the sound, but the _proper fret_ on the fingerboard of the instrument to be used by the player. This method of notation was called =Tablature=; it differed somewhat in the various countries. Until displaced by the violin, the lute was in use as an orchestral instrument. In addition, transcriptions of all sorts of vocal and instrumental pieces were made for the lute, for home use, much in the same manner as they are at the present day made for the pianoforte.

=Stringed Instruments Played with a Bow=.—The next and most important class resembles the last in being furnished with a neck or fingerboard, but with strings put in vibration by a bow, the familiar Violin family. A German writer on the stringed instruments played with a bow gives the following as the successive steps in the evolution of the violin: Rebec, Tromba Marina, Hurdy Gurdy, Fidel (Fidula), Chrotta, Viole, and Violin. The early history of instruments is shrouded in darkness, which existed up to the 16th century. Before that time, although writers on music made reference to the instruments in use, they did not give detailed descriptions. Virdung, who published a work in 1511; Agricola, in 1528; and Gerle, in 1546, were among the first writers. Yet much confusion has arisen from the fact that these writers used different terms for the same instruments, a difficulty that confronts the student of musical history who consults German, French, or Italian works.

1. The Rebec was of Oriental origin and consisted of a wooden frame, which formed the side walls, the top and the bottom being spanned with skin, like a drum. The instrument had only two strings, and was used in accompanying singing. Later the number of strings was increased to three. In the 8th or 9th century an instrument called the _Lyra_ (Lyre) was in use. Its shape shows a change toward the pear-shaped body and narrow neck of the lute.

[Illustration: REBEC. LYRE (ACCORDING TO GERBERT). BASS VIOL.]

2. The Tromba Marina (Eng., literally, “Marine Trumpet”), which the Germans call _Trumscheit_, had a long, sonorous body, over which a strong string, like that of the ’cello D, was stretched. This string, when sounded with the bow, gave forth a harsh, somewhat nasal tone, similar to that of the 8-foot wooden organ reed-pipe. But the proper way to play it was by lightly touching the string with the finger, as in making harmonics on the violin. This gave a series of tones, according to the pitch of the open string, the same as the so-called overtones. If the string were tuned to low C, the sounds were middle C, then in succession E, G, C, D, E, F, G, A, B, C. This instrument was a favorite with choirs of nuns to accompany their singing. Another name given to this instrument from its single string is Monochord.

3. The Hurdy Gurdy, also called Vielle, Radleier (“wheel lyre”), Bettlerleier (“mendicants’ lyre”), Organistrum and Chiffonie, was a great favorite in the period from the 10th to the 12th century. This peculiar instrument consisted of a resonant body, over which four strings were stretched. It has analogies to bowed and keyed instruments. Its shape was somewhat like that of the lute or the viola d’amore or guitar. Two of the strings were tuned in unison, were stopped by an arrangement of keys, directed by the player’s left hand shortening the string, thus making it possible to play melodies of a limited compass. The other two strings were usually tuned as Tonic and Dominant, thus giving a drone like the bagpipe. The strings are set in vibration by a wooden wheel, which, being well rosined, has the function of a violin bow; this wheel is turned by a handle at the tail end of the instrument, the player using his right hand for the purpose.

4. The Chrotta (Welsh Crwth—“crooth”) is one of the oldest of string instruments played with a bow. The original home was possibly India, but in its European use it was limited to England, and especially to Wales. It was a favorite instrument of the Welsh bards. The oldest form had three strings. In its later form it was mounted with six strings, four stretched over the fingerboard and played with the bow, and two lying at the side of the fingerboard, and pinched with the thumb of the left hand.

5. Fidula (Fidel, Fiddle), equivalent to “viol,” is the comprehensive term for the string instruments of the 8th to the 14th century. Its resonant body was arched and pear-shaped. The French flattened it more and called it Gigue, the Italians Giga, the Germans Geige, the latter term still being used. Two varieties were in use—the small and the large. The former had three strings tuned in fifths, the latter four to six, usually tuned in fourths and one third. The “large” species was made in four sizes for Discant (soprano), Alto, Tenor, and Bass. The “large” instrument had no bridge such as the violin of today has, and in its rounded form was difficult to play. Later it was cut out at the sides, thus approaching the shape of our violin.

6. The Viol, which first appears in the 15th century, had a resonant body which came almost to a point back of the neck, and the upper part of the body of the instrument was smaller than the lower; the fingerboard had frets like our guitar; the edges were higher, the _f_ holes were sickle-shaped, the top was flat, and the number of strings was six. Viols were divided into two groups—those held with the arm (like our violin), those played between the knees (like our 'cello). They were named the soprano or discant viol (violetta), the alto and tenor viols, and the bass viol (gamba). The contra-bass or double bass has the viol form in certain respects.

From the viol family comes our violin through a diminution and beautifying of the form, through lessening the number of strings and doing away with the frets.

QUESTIONS AND SUGGESTIONS.

What are the general classes into which musical instruments are grouped?

Name the percussion instruments.

Name the principles of classification for wind instruments.

Give examples of each class.

What is a reed? How many kinds are in use?

What methods of producing sound are used in playing stringed instruments?

Give examples of each class.

Give a description of the lute.

Name the steps in the evolution of the violin.

The catalogues of the instruments contained in the Metropolitan Museum (Crosby-Brown Collection), New York City, will be found very useful for reference. This collection is one of the most complete in the world, and is arranged so as to show the development of instruments of the various types. They can be secured at slight expense by addressing the Museum.

LESSON XVI.

THE ORGAN, ORGAN PLAYING AND ORGAN MUSIC.

In the book of Genesis it is written: "Jubal, he was the father of all such as handle the harp and organ." It is not to be understood that the word organ in this passage meant an instrument anything like that heard in our churches at the present day. In fact, as St. Augustine tells us, there was a time when all musical instruments were called organs.

=The Germ of the Organ=.—The invention of the organ is veiled in deepest darkness. Its development from its earliest forms to its present state has occupied a period of almost two thousand years. Doubtless, the first idea of a wind instrument was suggested by the breeze blowing across the open ends of broken reeds, the discovery naturally following that reeds of different lengths gave forth sounds of varying pitch. In course of time, reeds or pipes, differing in length, began to be joined together, conveniently arranged so as to produce a succession of musical sounds, the players blowing them with the mouth. These instruments were called =Pan's Pipes=, the =Syrinx= of the ancient Greeks.

=The First Stage of Development=.—As the number of pipes was increased, the moving of the head back and forth in order to blow them became difficult. The pipes were then placed in a sort of box or wind chest, a tube being added through which the player could blow, the pipes not intended to sound being closed by the fingers. Furthermore, as the pipes were increased in number and in size, it became necessary to employ various mechanical accessories to furnish adequate wind supply, and to open and close the pipes at will, the breath and fingers of the player proving insufficient. A device was invented in the form of a slide, rule or tongue of

wood, which was placed beneath the aperture of the pipe, and perforated so as to shut off or admit wind to the pipe as it was drawn back or forth. The earliest form of bellows might be suggested by the leathern bag of the bagpipe. In this the wind pressure was unsteady and the tone necessarily disconnected.

[Illustration: PAN'S PIPES (SYRINX). EARLY FORM OF THE ORGAN.]

=The Hydraulic Organ=.—The first attempts to secure regular or steady wind pressure were made by Ctesibus, who lived at Alexandria, about 180 B. C. To him is ascribed the invention of the so-called "=Hydraulic Organ=." This term seems somewhat of a misnomer, since the water was used merely to give the necessary pressure to the bellows, and to regulate the wind supply. This method was never developed, since the device did not seem applicable to instruments of any considerable size. The trend was rather toward a wind supply from a bellows operated on the same principle as that of the blacksmith's. In the Hydraulic Organ the water was thus applied: An inverted air receiver, into which the wind was forced by a bellows, was immersed in a tank of water, the pressure of the water around and above the receiver forcing the air through an aperture at the top into the pipes, the pressure being regulated by the volume of water in the tank. The hydraulic organ continued more or less in use up to the early part of the 14th century.

=The Earliest Organs=.—The organ developed little as to size or mechanical improvements during the first ten centuries of the Christian Era, and it is difficult to trace the progressive stages in point of time, place or mechanical invention. The first organ known to the people of Western Europe was a present from the Byzantine emperor, Constantine, to Pepin the Short, Major-Domo of the Frankish Kingdom, in 742. It had brass pipes and the "keys" were struck by hands and feet. Eastern organs also came into France in the time of Charlemagne, son of Pepin. The first organ used in Germany was made in 812, modelled after the one just mentioned. In 880, the Pope ordered an organ and an organ builder from Germany, which seems to indicate that the art had found support there at an early date. Although not considered absolutely indispensable, the organ from that time on seems to have been generally adopted for use in churches. Its many imperfections gave ground for criticism, yet today it is considered, _par excellence_, the ecclesiastical instrument.

=Increase in the Size of Organs=.—The organ builders of these early days were mostly monks, Pope Sylvester II (1003) being eminent, under the name of Gerbert, prior to his election to the papacy. They built small organs called "=Portative=," and large organs called "=Positive=." The old hydraulic organ, owing to its excessive weight, was called "Positive" to distinguish it from the "Portative" or portable organ, and these terms have been perpetuated to the present time. An organ built for the Cathedral at Winchester, England, had ten keys, four hundred pipes and twenty-six bellows, which were operated by seventy men, "in the sweat of their brows." Since forty pipes were attached to a single key, it may be readily understood why its tone was compared to thunder. The keys were very large, having a deep fall, and required the whole force of the hand to press down a single one.

=Mechanical Improvements=.—The pipes in the early organs were made of copper, lead, tin, silver, glass, ivory and various woods, but experiments finally showed =tin= or =wood= to be best suited for the purpose. The earliest organs had about twelve pipes, and the larger instruments three octaves, but without the chromatic intervals. The pipes were arranged according to the sequence of tones in the old Church modes, the _octave containing_ but _three semitones_: between E-F, A-B flat and B-C. The chromatic tones were added gradually, the breadth of the keys being correspondingly reduced as the increased number of keys occupied the same space as before. Heretofore, the _wind_ had usually been _forced from_ the _bellows_ by the _weight_ of men standing upon them, but in the 10th century use began to be made of a =lever=, the bellows presumably being weighted.

=The Keyboard is Adopted=.—In the 11th century, the keyboard appeared, supplanting the levers and slides, previously in use. The first organ containing this marked improvement was made for the Cathedral at Magdeburg, Germany. It had sixteen keys. In 1350, a monk at Thorn built an organ with twenty-two keys, and in 1361 an organ was built for the Cathedral at Halberstadt with fourteen diatonic and eight chromatic tones in a compass extending from B, second line, bass staff, to A, second space, treble. This organ had three keyboards, now termed manuals.

=The Pedals=.—The invention of pedals is variously ascribed to Albert Van Os (about 1120), to Van Valbeke, of Brabant, and to a German named =Bernhard= (1470), an organist of Venice. The latter probably improved, but did not invent the pedals. The pedals at first did not exceed the compass of an octave, and were used only for sustaining prolonged tones. They were _fastened_ to the broad _manual keys_ by stout cords, thus enabling the performer to draw down the desired key with the foot. About the year 1418 the pedals began to be attached to _independent pedal-pipes_, thus imparting to the organ a certain dignity and sonority, still a chief characteristic of the instrument. After 1475, all important organs were built with pedal keyboard.

=The Introduction of Stops=.—Up to the 14th century, the different registers (set of pipes with uniform tone quality) could not be sounded separately, that is to say: _all_ the _pipes_ belonging to any one key _sounded_ when that key was depressed. At the close of the 14th century it was found possible to add =valves= to the pipes in such a manner as to cause the wind to pass through or be cut off from any series of pipes at will. The opening and closing was managed through a spring. The next improvement was to introduce a =slide= to open or close the passage of wind into the pipes. With these improvements it became possible for builders to set themselves to the improvement of the various “stops” or registers.

=Improvements in Stops=.—In the 15th century, pipes of sixteen and thirty-two feet in length began to be used, necessitating a greatly _enlarged bellows_. Pipes were _closed_ at the _top_, thereby lowering the pitch an octave. They were given _smaller diameters_, producing a softer tone quality. The _shapes_ of the pipes were _varied_, giving additional variety in tone quality.

Thus began the broad classifications of “=Open=” and “=Stopped=” pipes in all their varieties. The “=Reeds=” (pipes containing a vibrator or tongue to set the column of air in motion) were familiar to the earliest performers, but were not introduced into the organ until as late as the 14th century. Further improvements were made in the bellows at the beginning of the 16th century.

=St. Mary’s, Lübeck=.—In 1561, a three-manual organ was in use in St. Mary’s, Lübeck, Germany. To this organ all the important improvements were successively added at various intervals until it had, at the beginning of the 18th century, in the three manuals, respectively, thirteen, fourteen and fifteen stops, and in the pedal, fifteen stops. It was to hear the famous Buxtehude play upon this organ that Sebastian Bach walked fifty miles in 1705.

=Design of Improvements=.—Great improvements have been made in organ building since the time of Bach, all designed to give the player greater resources, and increased facility in the handling and control of the resources, which in the present day are simply enormous.

=The Organ in the American Colonies=.—Although the first organs heard in America were probably introduced by the Spaniards, of these there are no authentic records. According to reliable historic data, the famous old “Brattle” organ was “the first organ that ever pealed to the glory of God in this country.” It was imported from London, in 1713, by Mr. Thomas Brattle, who bequeathed it to the Brattle Street Church, Boston, directing that the parish “procure a sober person that can play skilfully thereon with a loud noise.” This organ became the property of King’s Chapel, Boston, and was used until 1756.

=No Art in Early Organ Playing=.—The organs of the early Christian period were of such a character that playing, in the sense in which we now understand the word, was out of the question. For some time the span of the hand possible to players did not exceed the distance of a fifth. If an octave was to be struck, a second player was necessary. Only with the narrowing of the keys did artistic playing become possible. In fact, organ playing has invariably reflected the style and development of contemporary musical art.

=Early Organists=.—The credit of being “father of organists” is given to =Francesco Landino=, of Florence (1325-1390), and after him to =Bernhard=, mentioned as the inventor of the organ pedals. The oldest organ compositions are some works by =Konrad Paumann= (1410-1473), who was born blind, yet, like many others since, became a thoroughly trained musician in spite of his affliction. He also played other instruments and was a fine contrapuntist. Another of the early organists is =Benedictus Ducis= (or Hertoghs), born at Bruges, about 1480. He was a pupil of Josquin des Pres. From Ducis, representing the second Flemish school, as founded by Okeghem, there is a chain almost of master and pupil, between the early masters of organ playing and polyphonic writing and Bach, who in these arts became the master of all. Paumann’s pieces show the style of composing for the instrument that was considered appropriate. They are essentially transcribed, but elaborated, vocal works. The compositions of the next organists of fame, Willaert, of Venice (1490-1562), and Cyprian di Rore (1516-1565), pupil of the former, have distinct names. _Ricercari_, _Intonationi_, _Contrapunti_, _Toccati_, _Praeambula_, and _Canzoni_, but the character remains the same, vocal pieces, elaborated and freely embellished with runs and other passage work. Later the term _Ricercari_ came to mean a sort of fantasia in fugal form, often on a popular air; _Toccata_ became a free fantasia with brilliantly figurated passages, and a _Praeambulo_ a prelude to a larger piece. Other famous organists of this period were =Bernhard Schmidt= (1520-?), German; =Claudio Merulo= (1532-1604), organist at Venice, and his successors, the two =Gabrieli’s=.

=Frescobaldi and His Successors=.—The greatest of all the organists of the earlier days, to whom the title of “Father of true organ playing” has been given, was =Girolamo Frescobaldi=, born in 1583 at Ferrara, in Italy, educated in Flanders, and from 1608 to his death in 1644 organist at St. Peter’s, Rome. His fame was so great that the spacious cathedral was often filled when he gave an organ recital. His compositions, many of which have been preserved, have a very decided contrapuntal character, whence some have called him the inventor of the organ fugue. Two prominent German organists, whose compositions were studied by Bach,

were =Caspar Kerl= (1627-1693), and =Jacob Froberger= (———1667), both of whom lived in Vienna. The most eminent organist of the 17th century was =Johann Peter Sweelinck= (1562-1621), pupil of Zarlino, the famous Italian theorist, and of Andreas Gabrieli, organist of Venice. Sweelinck occupied the position of organist at the Cathedral in Amsterdam, and gave much attention to the development of the fugal style of composition. His compositions are of the highest importance historically, since they exhibit the first known examples of the independent use of the pedals in a real fugal part. He was the most eminent organist of his time (being called the organist maker), and was the teacher of the following noted players: =Jacob Praetorius= (died at Hamburg in 1651); =Heinrich Scheidemann= (1596-1663), also located at Hamburg; =Jan Adams Reinken= (1623-1722), from 1663 organist and successor to Scheidemann at the Catherine Church, Hamburg (Bach came to Hamburg several times to hear Reinken play and to learn his style); =Samuel Scheidt= (1587-1654), organist at Halle. Some of their compositions are accessible.

[Illustration: JOHANN PETER SWEELINCK.]

Other famous organists of this period were =Johann Pachelbel= (1653-1706), located at Nuremberg (Bach studied his works as a lad); =Dietrich Buxtehude= (1637-1707), organist at Lübeck for thirty-nine years. One of the most important names of this period of development is that of =Johann Joseph Fux= (1660-1741). His "_Gradus ad Parnassum_," published in 1725, a treatise on counterpoint based on the practice of the great masters, played an important part in the training of Haydn, Mozart and Beethoven.

=English Organists=.—In the history of English organ playing, the first great name to engage our attention is that of =Thomas Tallys=, born about 1520. He is called the "Father of English church music." He served under Henry VIII, Edward VI, Queen Mary and Queen Elizabeth, as organist of the Chapel Royal. English organists of distinction contemporary with and succeeding Tallys were =John Merbecke=, =Richard Farrant=, =William Byrd=, =John Bull=, =Thomas Morley=, =Orlando Gibbons= (a contemporary of Frescobaldi), =Matthew Lock=, =John Blow= and =Henry Purcell=. The last mentioned, born in 1658, became organist of Westminster Abbey in 1680. The name of Purcell is one of the strongest in the history of English music. It was his ambition to found a distinctive school of English composition. Although not successful in this, he made a lasting impression on English church music and produced many charming secular works. It is on record that he stood high in the estimation of his European contemporaries.

=Culmination in Bach and Handel=.—The Polyphonic Period culminated in Bach and Handel, both born in 1685. These two, who never met, and who worked upon dissimilar lines, were the most famous organists of their day, in addition to their greatness in composition.

=The Organ and Polyphonic Music=.—Bach must be regarded as the source of modern organ composition and playing. In him polyphonic composition attained its highest perfection and the organ stands as the centre of the Polyphonic school. The development of the Opera and its influence towards a freer style in vocal and instrumental composition and the tendency of instrumental music to develop along harmonic lines had the effect of relegating polyphonic music to the Church with the organ as its chief vehicle. It is only of comparatively recent years that the organ has become a concert instrument. Bach's treatment of the instrument serves as a model for the composers of all time and the study of his works is indispensable to the development of technical command of the organ and the cultivation of the true organ style. Handel's permanent contribution to organ literature consists of sets of =Concertos=. These concertos, a number of which are still played and admired, excited the enthusiasm of Sir John Hawkins, who gives a glowing account of them in his history. =Bach= was appointed Cantor at the _St. Thomas Schule_, Leipzig, in 1723, and it was here that much of his greatest work was accomplished. In addition to his duties at the school, he directed the music in the Churches of St. Thomas and St. Nicholas. As to the relative superiority of Bach and Handel as organists, contemporary opinion seems to have differed widely. Each undoubtedly had a style of his own as shown in his published compositions. Each excelled in improvisation.

=The Chorale in Protestant Organ Music=.—In addition to his incomparable preludes and fugues, toccatas, fantasias and pieces in the larger forms, Bach made the polyphonic treatment of the =chorale= an art peculiarly his own. In fact, the German style of organ playing may be said to have developed from the chorale and from the music of the Reformation. This furnished a fresher and very different source of inspiration from the Gregorian chant which had been handled so effectively by Frescobaldi and his Italian successors.

=Marchand=.—One of the most renowned of early French organists was =Louis Marchand= (1671-1732). In 1717, while living under banishment in Dresden, he was to have entered into a trial of skill with Bach, but lost courage and departed on the morning of the appointed day. A certain triviality has at times characterized the French school of organ music, undoubtedly a reflection of the prevailing style and taste in other branches of musical composition. Of later years, however, a more serious and exalted style has

developed.

=The German School=.—To return to the German organists. A name familiar to all students of the organ is that of Rinck. =Johann C. H. Rinck= (1770-1846) was a pupil of Kittel, who in turn was a pupil of J. S. Bach. Rinck's reputation is based largely on his "Practical Organ School," a work still in use. Another name of importance is that of =Johann Gottlob Schneider= (1789-1864). He has had the reputation of being one of the greatest German organists since the time of Bach. Of the great composers since Bach, =Mendelssohn= stands conspicuous as an organist and composer of organ music. Haydn, Mozart and Beethoven, although occasionally using the organ in their scores, did not compose for the instrument. Mendelssohn developed a decided fondness for the organ, which he played admirably. His six sonatas and three preludes and fugues are masterpieces. Among the representative German organists and composers should be mentioned: =Adolph Hesse= (1809-1863), author of the "Practical Organist" and a prolific composer; =Karl August Haupt= (1810-1891), a celebrated teacher, numbering among his many pupils from all countries such prominent American organists as Eugene Thayer, Clarence Eddy and J. K. Paine; =Carl Ludwig Thiele= (1816-1848) composer of some of the most difficult known works for the organ; =Gustav Merkel= (1827-1885), a prolific composer, whose sonatas are numbered among the standard works for the instrument; =J. G. Rheinberger= (1837-1901), one of the finest organists and best teachers of his time and a composer of great ability, whose twenty sonatas form a permanent addition to the best organ literature. A number of American organists were among his pupils.

=The French School=.—Prominent among organists of the French school in the 19th century may be mentioned: =L. J. A. Lefébure-Wély= (1817-1869) and =Antoine Eduard Batiste= (1820-1876). The works of both these organists are still widely played and have won much popularity. Wely has been called the "Auber of the organ." His works display fertility of melodic invention and a piquancy of harmonic treatment, but are entirely lacking in the polyphonic element. Much the same may be said of Batiste, who was a fine player and teacher, and who equalled Wely in tunefulness but not in musicianship. =Nicholas Jacques Lemmens= (1823-81), a great player (especially of Bach) and author of the celebrated "Ecole d'Orgue" may be said to have laid the foundation of the modern French school. Conspicuous among his successors have been: =Camille Saint-Saëns= (1835-——), a most versatile musician and a noted organist; =Théodore Dubois= (1837-——), =Théodore Salome= (1834-——) and =Felix Alexandre Guilmant= (1837-——). Guilmant, one of the most noted organists and composers of the present day, was a favorite pupil of Lemmens. He has been one of the most prolific composers since the time of Bach, is a master of all the resources of the modern organ, and has a fertility of invention and a fluent command of contrapuntal resources. Another eminent French organist is =C. M. Widor= (1845-——), also a composer of distinction. A powerful influence was exerted on modern organ music, as well as general composition, by the eminent organist and composer, =César Franck=, who was, for a number of years, in charge of the organ class at the Paris _Conservatoire_.

=The Italian School=.—Among recent Italian organists =Filippo Capocci= (1840-——) and =Enrico Bossi= (1861-——) are worthy of mention. Both are splendid organists and prolific composers. They are leaders in the revival of good organ playing in Italy, where a determined effort is being made to restore the art to its former supremacy.

=The English School=.—England has furnished a long line of 19th century organists of ability, prominent among whom are: =Sir John Goss= (1800-1880), =Henry Smart= (1813-1879), =E. J. Hopkins= (1818-1901), =S. S. Wesley= (1810-1876), =Dr. Wm. Spark= (1825-1897). Foremost among English organists stands the name of =Wm. T. Best= (1826-1897). He was one of the most famous concert organists of his time, but is best known to organ students by his "Arrangements from the Scores of the Great Masters," in which he demonstrated that the organ is in itself capable of reproducing certain orchestral effects without transcending its proper functions or descending to trickery. "The Organ," by =Sir John Stainer= (1840-1901), is one of the most widely used elementary works for instruction in organ playing. Dr. Stainer was the successor of Sir John Goss, at St. Paul's, London, and was appointed Professor of Music at Oxford University in 1889. =Frederic Archer= (1838-1901) has been considered one of the greatest of organ players. After a successful career in England, he came to America in 1880. He did much towards popularizing and elevating the art of organ playing in this country. Prominent among contemporary English organists stands =Edwin H. Lemare= (1865-——), who succeeded Frederic Archer as organist of Carnegie Hall, Pittsburg, in 1902. He is a skilful virtuoso, a composer of originality, and a leading representative of the modern English school.

=Modern Organ Music=.—Organ playing and composition have kept pace with the mechanical and artistic evolution of the instrument, and the lines between the various schools are becoming less closely drawn. The tendency of builders to imitate orchestral tone and effects has had influence on composers and players alike. This tendency is less noticeable in the works of the German school, where a modified polyphony still flourishes, based on the principle of the classic treatment of the chorale and growing out of the music of the Lutheran Church. The organ compositions of the modern French school are characterized by grace,

refinement and originality, coupled with a certain dignity and elegance. They combine free harmonic treatment and modern polyphony, together with certain ornate characteristics, growing out of the elaborate ceremonial music of the Latin Church, and bringing into play all the resources of tone color and expressive treatment of the modern instrument. Much the same may be said of the modern English school, which nevertheless still shows traces of the early English style, based on the dignity and purity of cathedral use and tradition. The orchestral tendency, both in composition for the organ and in the transcription of orchestral works for the instrument, shows itself more or less in all schools, and the organ, in addition to its position in the church, is becoming more and more a concert instrument. The compositions of the American organists reflect, in a measure, the characteristics of the schools in which they have been trained, and in particular show traces of the styles of the masters with whom they have chiefly studied.[9]

QUESTIONS.

In what early instrument is the germ of the organ found? Describe its gradual development.

Describe the general character of the early organs.

Describe the various mechanical improvements.

When and by whom were pedals introduced?

Mention some of the early organists.

In whom did the Polyphonic Period culminate? Who is the source of modern organ composition and playing?

Mention some German organists since the time of Bach.

Mention some prominent French and English organists of the 19th century.

Describe the modern tendencies in organ composition.

SUGGESTIONS FOR A REVIEW OF LESSONS VIII TO XVI.

Get a clear idea of the period, which includes the years between 1100 and the death of Palestrina in 1594, almost 500 years. The lesson on the organ and organ playing belongs to this period, chronologically, in part only.

The difference between the monophonic and polyphonic styles must be clearly appreciated in order to get a clear grasp of the two fundamental styles in music. Illustrations from the masters are to be placed in contrast. Polyphony developed from melodic principles, the simultaneous sounding of several melodies. Monophony depends upon a harmonic basis.

Indicate the steps in the growth of Polyphony.

How did the Church contribute?

What political and other conditions made Paris the centre of Europe in the 12th century?

What is the force of Imitation as a principle to secure Unity in musical composition? How was it used by the composers of the Paris school?

What advances in the use of Imitation did the men of the Gallo-Belgic school make?

Indicate certain historical events and name prominent personages of the periods included in this section.

Why did the early English school exercise so little influence on music?

What noted musical composition is credited to the English school? What kind of work is it?

What historical periods coincide with the English school as described in this section?

Compare the Gallo-Belgic and the Netherlands schools. What did the former contribute to the latter?

What is the musical value of the principle of the Canon?

Why did the musical centre shift respectively from Paris to Belgium, to the Netherlands and then to Italy?

Make a list of the composers of the different schools of this period and trace the connection between them.

Give a sketch of Palestrina and show his contribution to church music.

Describe the madrigal. Compare a madrigal with a modern part-song and note the difference in style.

Give the classification of musical instruments. Examples in each class.

Give a sketch of the development of the viol.

What is the germ of the principle of the organ?

What is the necessity for the use of a bellows?

What are the successive steps in improving the organ?

Mention the important players in chronological order.

Classify them in the proper schools.

Compare the German, French and English schools.

LESSON XVII.

THE BEGINNING OF THE OPERA.

=The Renaissance=.—The Opera, in its inception, was literary rather than musical in nature. It was a result of what is known as the Renaissance, so-called because its most prominent manifestation in Italy was a revival of the learning of the ancients. This phase of the movement was initiated by =Petrarch= (1304-1370), who devoted his life to the study of the classical past of Italy. The Latin classics had never been entirely lost, but those of the Greeks had become practically extinct during the dark ages which followed the conquest of the Roman Empire by the barbarians of the North, in the 5th century. The arts had been kept alive only through the fostering care of the Church, and all had taken on a conventionally ecclesiastical character. Education had declined; it was practically confined to churchmen—even kings and rulers could barely sign their names, while the people at large were sunk in gross ignorance. The revival of Latin literature through the influence of Petrarch led to an interest in the Greek classics which soon became the engrossing study of the learned. Diligent search was made for lost and forgotten manuscripts; academies of learning were founded; lectures were given on Greek philosophy. In the enthusiasm thus created it was even thought that not only the arts and literature of the ancient world might be restored, but its governmental, social and political structure as well.

=Scope of the Renaissance=.—The Renaissance, however, was not merely literary in nature. It was in reality the awakening of man from the spiritual and intellectual slumber which had bound him for nearly a thousand years. Long before it was defined it had been perceptible in many ways. First, materially, in a spirit of exploration, of adventure and enterprise. Traders and travelers startled Europe with glowing accounts of the far East; missionaries took long and dangerous voyages in the hope of converting its heathen inhabitants. An eager desire for increased commercial facilities with these favored countries by means of a westward passage brought about the discovery of America, with which modern history may be said to have opened.

With this extension of the world's boundaries, the mind of man began to expand as well. As he looked forward with eager anticipation to the future, he studied the past with an eye newly alive to the treasures of its buried culture. Instead of his former

acquiescence in being one of a dull, inert mass, serving without question those in authority over him, he began to feel and to assert his own individuality, to resist the crushing weight of feudalism which had hitherto oppressed him. Freedom of intellect, of conscience, of science, of art, was in the air.

The effect of this transition from medievalism toward modern liberty of thought and action varied with different nationalities. In northern nations it took the direction of rebellion against prevailing religious and political conditions, for example, in Germany and England. Italy, however, remained steadfast in religion and government; the revolt was against traditions in matters of art and literature. Roman law and Greek philosophy were exhumed; the classics were zealously studied for standards of taste and culture.

=Music of the Ancients=.—Notwithstanding this research, no trace was found of the music actually in use among the ancients. From the evanescent nature of the art and the total lack of examples, the elaborate descriptions of its complicated system of scales and modes given by Greek philosophers failed to yield a trustworthy clue to its real character.

It was known, however, that the _drama_, owing to the enormous proportions of the amphitheatre in which it was performed, was _musically declaimed_, and that the voices of the actors and chorus were sustained by lyres and flutes. Thus, in the Greek tragedy we find the principal features of the modern opera—scenery, dramatic action, solo and choral singing, the orchestra. It was also known that in the music of the Greeks the _word_ was the _governing principle_; that there was no independent instrumental music—nor was there elsewhere for many centuries afterward. The tone was regarded only as a means of heightening the effect of the poetry; the succession of long and short syllables dictated both rhythm and melody. Of harmony in the modern sense of the term, there was none; instruments and voices alike were in unison.

=Music Chiefly Choral=.—In the 16th century, Florence was the centre of the enthusiasm for Greek culture. She and her sister-cities in the north of Italy were the arbiters in matters of taste, of learning and erudition. There, toward the end of the century, a small group of scholars and musicians, known as the _Camerata_ (Chamber), meeting at the house of Count Bardi, discussed the possibility of reproducing the musical declamation of Greek tragedy. The time was ripe for such an experiment. The polyphonic school had reached its climax in the intricate works of =di Lasso= (1520-1594) and =Palestrina= (1514-1594). Though admirably suited to the Church, the contrapuntal style of these great composers was manifestly unfit for dramatic purposes; it could voice the aspirations of a body of worshipers swayed by a common belief, but could not express individual feeling. No voice was more important than another, all progressed according to canonic law, their complex intertwining practically destroying the essentially secular elements of accent and rhythm. It was, in short, the embodiment in music of the medievalism which had so long controlled Church and State.

Thus far the spirit of emancipation which had produced such great results in the other arts and in politics elsewhere had touched music but lightly. Attempts had been made to break the restraints of contrapuntalism, but there was a total ignorance as to what steps would prove most effective in reaching that end, and nothing definite had been accomplished. Aside from the Folk-song, which was ignored by musicians save only as it served as Cantus Firmus for their counterpoint, there was no music for the solo voice; it was conceived solely from a choral standpoint.

=The Recitative=.—Their dissatisfaction with the school of music then in vogue and the impossibility of adapting it to their purpose led to various experiments by this band of enthusiasts to discover the principles upon which the Greeks had founded the musical declamation employed in their tragedies. They argued that it must have followed as closely as possible the _inflections of the voice_ in speaking; therefore they made this their study. Thus originated the Recitative, the distinguishing feature of the lyric drama, which, though using the definite pitches of the musical scale, reproduces in its progressions and cadences the characteristic but intensified effect of an oratorical delivery of the text. It was the exact contrary of the music of the age in which the word counted for almost nothing, the art of combining independent voices and of playing them off one against the other for everything.

=The Cantata=.—The first result of their efforts was the Cantata (from _cantare_, to sing), meaning a composition for the voice in contradistinction to the Sonata (from _sonare_, to sound), which was applied to one for instruments. The Cantata had but little in common with what is now understood by the term. It was a recitation on musical intervals for a single voice accompanied by but one instrument. Anything like a formal melody was carefully avoided, and the accompaniment, generally played on the lute, was of the most unpretending character. The first of these cantatas was composed by =Vincenzo Galilei=, the father of the celebrated astronomer, on the tragic fate of Count Ugolino, as related by Dante in the _Inferno_. This, therefore, was the _first art-song_ ever composed. Unfortunately, it has been lost; but contemporary accounts tell of the profound impression it created. Other cantatas were written and sung by =Giulio Caccini= (1550-1618), a skilled and an admirable lutist as well, and all awakened the utmost

enthusiasm among the little company.

These works were known as _Nuove Musiche_ (new music) and such as have survived are, in general, painfully thin and crude to modern ears. When compared with the rich polyphony of the prevailing Church style they seem at the first blush to indicate retrogression. Progress, however, seldom advances in a direct line; it generally moves by spirals which at times apparently retreat only to mount the higher at the succeeding curve. These dull recitatives bore the _germ of emancipation_ from the scholastic laws which had heretofore prevented music from expressing individual emotion; they typify the spirit of the Renaissance and are the foundation of the art as we now know it.

=The First Opera=.—Another of the number, =Jacopo Peri= (1561-1633), also a musician, took the next step by composing music of the same style to a drama, the _Dafne_ (Daphne) of the poet Rinuccini, who was the life and soul of this attempt to revive the lost declamation of the Greeks. This was performed privately in 1595 at the Corsi Palace, and produced so strong an impression that it was repeated a number of times at the Carnival seasons of the succeeding years. In 1600, Peri was invited to compose a similar work for the marriage festivities of Henry IV of France and Maria di Medici. This was _Euridice_, also written by Rinuccini, which bears the distinction of being the _first opera_ to receive public performance, and thus introducing the new art-form to the world at large. The score of _Dafne_ has been lost, but that of _Euridice_ still exists.

It was then known as a music drama (_melo dramma_ or _dramma per la musica_); the term opera (abbreviation for _opera in musica_, that is, musical work) did not come into use until the middle of the century. The orchestra, which was played behind the scenes, consisted of a harpsichord, two lutes and a bass-viol. In addition, three lutes played a short _ritornello_ (interlude) in one scene. With this exception, the instruments were used merely to support the voice; the tonality was almost exclusively minor, and the harmony of the simplest. It is thought that Peri sang the part of Orpheus and that Francesca Caccini, daughter of the composer and one of the most gifted singers of the day, sang Euridice.

[Music: Radoppia e fiamm’e lumi al memorabil giorno, Febo ch’il carro d’or rivolgi intorno.

PART OF AN AIR BY CACCINI.]

Caccini claimed the new style as his invention, and it is certain that parts of _Euridice_ were composed by him, though Peri’s name alone appears on the title page of the published work. Emulating the success of his colleague, the former soon set the same drama to music.

=Characteristics of the Early Opera=.—The two settings are so similar that one might almost be taken for the other. Both display the same characteristics. Of dramatic feeling or characterization as understood at the present day there is no sign; development of musical thought, none whatever; a dreary waste of recitatives is but slightly relieved by the occasional flourishes (_giri e gruppi_, that is, runs and turns) allowed the singers by the taste of the times. The choruses, however, which are introduced freely, serve to vary the monotony somewhat. They exhibit a singular mingling of the old and new styles, natural under the circumstances. The voices sing either in a recitative-like unison, or begin in fugato, and later move in simple harmonic progression. Their distaste for the contrapuntal style led these reformers to reject it so far as they could. Its appearance at all is due to the fact that no other mode of writing for a number of voices had as yet been devised—a strictly harmonic treatment had not been thought of. Since, then, they were at a loss as to the management of choral masses, they were obliged to have recourse in part to old methods.

Another name associated with the Florentine school deserving mention is that of =Marco da Gagliano=, a priest who soon took the lead in the new movement. His first opera was _Dafne_ (1607), composed to Rinuccini’s drama which had already served Peri; it was a common practice in those days for composers to use the same text. As a scholar and musician, Gagliano was superior to his predecessors. He shows a greater warmth of feeling and a tendency toward melody which they considered as a lowering of their ideals.

=The Florentine School=.—One particular characteristic of the Florentine school was a sedulous _avoidance_ of anything like _extended melody_ or definite form. To the composers of this school, music was not an end in itself; it was subordinate to the distinct, _impassioned declamation_ of the poet’s verses. They held that any independent development of musical thought was a weakness; that it tended to distract the attention of the hearer from the drama, and to interfere with its logical continuity. The predominant influence was that of the scholar, not of the musician. This was to be expected from the character of the little coterie interested in the new art-form. The majority were wealthy amateurs, zealous students of the classics and aflame with the desire for the actual revival of the Greek tragedy. Peri and Caccini were the only musicians and they were strongly averse to the contrapuntal

music of the day. Its persistently ecclesiastical effect debarred it from expressing the personal feeling which was the object of their research. In the effort to escape its ban, they unwittingly emancipated their art from the control of the Church, and made it accessible to mankind in general. This, therefore, is the great service of the Florentine reformers: the establishment of a purely secular school of music susceptible of indefinite development.

Making allowance for the vast difference in means due to the practical creation of independent instrumental music since the 17th century, their practice was precisely the same as that of the modern composer who writes a music drama and uses the same term to define his work. When _Dafne_ and _Euridice_ first saw the light, however, there was neither knowledge nor experience to point the way; it was found only after a slow and laborious process of experimentation, involving the acceptance of much that was rejected after having served its turn. Though Peri and Caccini with their confrères did not succeed in the end they had in view, they accomplished far more by originating the Opera, the point of departure for the whole modern art of music.

QUESTIONS AND SUGGESTIONS.

What was the Renaissance?

What was the effect of this idea on music?

What was the origin of Recitative?

What was understood by _Nuove Musiche_?

Who wrote the first opera? What term was applied to this kind of musical work?

Give a description of the early opera.

Give an account of the Florentine school and their fundamental ideas.

Since the beginning of the Opera is practically the beginning of a century, the 17th, it should not be a difficult matter to keep this date in mind. It therefore antedates the settlement at Jamestown, Va., by a few years, making the beginning of American history under English auspices and the Opera coincide.

LESSON XVIII.

THE ORATORIO. DEVELOPMENT OF THE OPERA.

=The First Oratorio=.—The novelty of the new style, which was called the _stilo rappresentativo_ (representative style), the vigor and freedom it gave to an impressive delivery of the text, aroused universal attention. Among the composers who essayed it was =Emilio del Cavaliere= (1550-1599). By applying it to a sacred subject, he originated the Oratorio. Roman by birth, he had passed part of his life in Florence, and though not a member of the _Camerata_, was familiar with its aims and practice.

The germ both of the Opera and Oratorio is to be found in the Miracle Plays or so-called Mysteries of the Middle Ages. These were dramatic representations of _Bible scenes_ or _religious allegories_ by means of which a populace unable to read was taught the great truths of sacred history. Cavaliere's oratorio, _La Rappresentazione di Anima e di Corpo_ (The Representation of Soul and Body), was given in 1600 in Rome, at the Oratory of the Church of Santa Maria in Vallicella—hence its name.

[Music: PASSAGE FROM CAVALIERE'S ORATORIO.]

=Its Characteristics=.—Save for the _nature_ of the _subject_, there was no apparent difference between it and an opera. The allegorical characters taking part appeared in costume and in action. The score even gives directions by which it may be concluded with a dance if so desired. By this, however, dignified and stately movements are understood, in nowise resembling the rapid dance of modern times. The composer in his instructions for performance, which are unusually full and complete, lays great stress upon an expressive delivery of the text, and the swelling and diminishing of the tones by the singers. In vigor and characterization it far surpasses Peri's and Caccini's operas. Cavaliere's death, which occurred ten months before the production of his work, and the great popularity of the Opera, put a stop to the immediate development of the Oratorio; that was reserved for Carissimi a generation later.

=Monteverde=.—The task of taking the opera from the experimental stage and of placing it on the artistic foundation which it now occupies was accomplished by =Claudio Monteverde= (1568-1643), a man of extraordinary genius and originality. A harmonist of surpassing force and boldness, he had always rebelled against the restraints of the contrapuntal school, though, unlike Peri and Caccini, he was skilled in its intricacies. He was viol player in the band of the Duke of Mantua, and had composed masses and madrigals, many of which were severely criticised by the pedants of the day. He joined definite issue with them in his _freedom of treating dissonances_, the distinguishing feature of modern harmony. Heretofore, sevenths, ninths, augmented fourths and the like had never been heard without preparation. Monteverde, however, introduced them without regard to this restriction, little heeding the anathemas heaped upon his head by those who considered his infractions of established rules unpardonable. His ardent, restless temperament, seeking novel modes of expression, often led to wild and extravagant combinations which even today appear harsh and forced. At that time they must have seemed wilful attempts at outraging the ear and the sense of harmonic propriety. These innovations, however, are the cornerstone of modern harmony; of this as well as of the opera, Monteverde is the real founder. What are defects in his church music are excellences in his operas. The discords which disturb the serenity of a religious atmosphere are admirably fitted to produce dramatic effects and powerful climaxes. Monteverde belonged to the stage as his great contemporary, Palestrina, belonged to the church.

=Position of Music in the 17th Century=.—The interest which the success of the Florentine composers would have for a man thus gifted can be readily imagined. Yet he was obliged to wait a number of years for an opportunity to emulate their achievements. Music then was the especial pastime of the great; it was part of the state with which they surrounded themselves. Almost all titled and wealthy families had their own bands of musicians and choirs of singers. These assisted in their private chapels and lent additional eclat to seasons of festivity. Concerts and operas were given only at court or in the palaces of noblemen; public halls for any kind of musical occasion were unknown. A musician or composer could make his way only by attaching himself to a noble house or by securing a patron in court circles. _Dafne_ and _Euridice_ were made possible through the interest and protection of Count Bardi and Count Corsi. The opera was also attended with great expense. The taste of the times demanded an enormous outlay for mounting—costumes, scenery, decorations; only the extremely wealthy could afford it, and they reserved it for occasions of especial importance.

[Music: ARIADNE'S LAMENT.]

=Monteverde's First Opera=.—In 1607, the marriage of Margaret of Savoy to Francesco Gonzaga, son of the Duke of Mantua, opened the way for Monteverde's first opera, _Arianna_ (Ariadne), which was received with the utmost enthusiasm. Unfortunately, but a fragment of it remains, Ariadne's lament after her desertion by Theseus, the most celebrated opera air ever written. In its unprepared discords of the harshest nature, in the poignant expression of grief and despair so at variance with the placid art of the day, this shows how, by a single stroke, Monteverde cut loose from all the traditions of the past. In its less than a score of measures it also anticipates principles of artistic structure which were not formulated for nearly a century later and which hold good to the present day. It is said that it brought tears to every eye.

[Music: RITORNELLO BY MONTEVERDE.]

=His Second Opera=.—The following year he produced his second opera, _Orfeo_ (Orpheus), so called to distinguish it from Peri's _Euridice_ on the same subject. Though most of Monteverde's works have been lost, the score of _Orfeo_ has been preserved. It shows a surprising advance over the simplicity of the Florentine operas. First of all, in the great _expansion of the orchestra_. This numbers thirty-seven instruments which throughout are _combined in groups_ and as a whole with an art prefiguring certain effects of orchestration supposed to be purely modern. Like harmony, instrumentation dates from Monteverde. Instead of the customary vocal prologue, it begins with a _Toccata_ (instrumental prelude). The composer's keen dramatic instinct is shown by the masterly way in which he avoids the monotony of his predecessors; the recitatives are varied by the introduction of _ritornelli_, and each act

ends with a chorus and a stately passage for the orchestra. Five years later, the most famous composer of the day, he left Mantua for Venice, where until his death he was director of music at St. Mark's.

=Monteverde's Characteristics=.—Monteverde's greatest service to the opera lay in enlarging the sphere of the orchestra, and in the initiation of a thoroughly instrumental style adapted to the character of each instrument. He increased the number of players and released the orchestra from the subordinate position of being a mere support for the voice by employing it to heighten the dramatic situation. He originated many previously unknown effects, among them the _pizzicato_ and the _tremolo_ of the violins in precisely the same form as used at present. The latter so astounded the players that at first they refused to attempt it, saying that it was impossible. He endowed the Recitative with far greater freedom and depth of expression; under his hand it lost much of the dryness of the Florentine school. His manner of _writing_ for the voice was _declamatory_ rather than melodious; what traces of definite melody occur in his works are generally confined to the instruments, in which he curiously anticipates the practice of latter-day dramatic composers.

=Popularization of the Opera=.—Until 1637 the opera was restricted to royalty and the nobility. In that year the first public opera house was opened in Venice, and such was the popularity of the new amusement that before the end of the century there were no fewer than eleven in that city alone, then with a population of about 140,000. It spread through Italy with almost like rapidity, bearing in its wake an unparalleled development of the art of song.

=Change of Character=.—With its introduction to the people, it was manifestly impossible for the opera to retain its original character. So long as it was confined to the cultivated, the classical ideals of its founders met with intelligent appreciation, but when confronted with audiences drawn from the masses desirous only of being amused, a change was inevitable. Mythological and classical subjects were gradually discarded in favor of those involving intrigue and disguise; comic personages were introduced to enliven the scene. As the dramatic action was thus brought nearer the comprehension of the unlearned, so the music departed from the oratorical standards of the early school, and showed a frank _tendency toward melody_ and _regularity of form_. What was lost in elevation of theme, however, was made up by the human interest imparted to the play and the consequent endeavor of the composer to express, by his music, the varying vicissitudes of life. Thus it gained in warmth of feeling and flexibility in means of expression, while the evolution of rhythmic melody and definite musical structure laid the foundation of the art as we now have it.

=The Venetian School=.—Venice naturally became the centre of an important development of the opera. Of the numerous composers forming the Venetian school, =Francesco Cavalli= (1600-1676) and =Marco Cesti= (1620-1669) are second only in importance to Monteverde. The first was Monteverde's pupil, and had much of his broad dramatic style modified by the influences of which we have just spoken. Cesti came to Venice from Rome, where he had been the pupil of Carissimi, and brought with him the smoothness and melodic flow of his master, albeit lacking in essential power. Other names of a later date are =Giovanni Legrenzi= (1625-1690), especially noted for spirit and vivacity, and =Antonio Lotti= (1667-1740), his pupil, known by one or two charming airs which still survive.

=Carissimi and the Oratorio=.—=Giovanni Carissimi= (1604-1674), though he never wrote for the stage, was the strongest musical influence of his day. He was an ardent admirer of the new school, and adapted it in the form of oratorios and cantatas to the Church. In such works the necessity for form as regards definite tonality, distinct rhythm and melodic sequence is naturally much greater than in the Opera where music is used to illustrate the dramatic situation, and is furthermore elucidated by the action of the play. When the ear alone is obliged to pass judgment there must be evidence of design in these particulars, else the effect is confused and bewildering. Carissimi's musical instinct grasped this truth. His oratorios and cantatas show a logical arrangement of choruses and ensembles, recitatives and arias combined with a unity of effect and a clearness of characterization heretofore unknown. The choruses in particular are strongly rhythmic and far more dramatic than those which were commonly heard on the stage.

[Music: FROM "JEPHTHA" BY CARISSIMI.]

=Secularization of Church Music=.—This introduction of the new style into the Church marked the passing of the old school and strongly affected methods of dramatic composition. The public had never been in sympathy with the austere standards of the Florentine school and welcomed the appearance of _intelligible melody_ and the _spirited rhythms_ to which Carissimi gave the first direct impulse. Not only this; he fixed the form that the music of the Church was to bear for a century to come. This secularization of church music had its good and bad sides; good by reason of the greater freedom and variety of expression thus gained; bad because of the bold and mechanical imitation of Carissimi's purely formal details by his successors, which in the end

led to a tiresome monotony of style.

=Characteristics of the Venetian School=.—Thus was taken the first step toward the complete reversal of the conditions under which the early Opera had arisen. Instead of the music's being subordinate to the drama, the drama was soon to serve merely as an excuse for the music; the opera was destined to sink to the level of a concert sung in costume; the dramatic action reduced to a minimum. The Venetian school marks the turning-point in this direction. The high ideals of Monteverde and his predecessors were gradually thrust into the background; the singer began to assume precedence over the actor; truth of _expression yielded_ to the fascinations of _time_ and _tune_, which even the musically uncultivated could enjoy without bothering their heads as to real dramatic fitness. Closely connected with these tendencies was the establishment of a school of singing which, if we may believe contemporary accounts, surpassed in technical facility and brilliancy any vocal art heard either before or since that time. The result was that singers finally regarded the opera only as a field for the display of their dazzling accomplishments and in this they were willingly supported by a public eager to be entertained and amused.

QUESTIONS AND SUGGESTIONS.

Who wrote the first oratorio? In what respects did an opera and an oratorio differ?

Give an account of Monteverde and his innovations in Opera.

What was the state of music in the 17th century?

Describe Monteverde's first opera.

Describe Monteverde's second opera.

What was understood by the terms Toccata, Ritornello?

What were Monteverde's contributions to the Opera?

What change took place in the character of the Opera in the latter half of the 17th century?

Who were the prominent members of the Venetian school?

Give an account of Carissimi and his work.

Give a characterization of the Venetian school.

A short account of the Mysteries or Miracle Plays of the Middle Ages may be assigned to a pupil as special work. The Passion Play, still given today at Oberammergau, Germany, is a relic of the old-time religious plays.

LESSON XIX.

ALESSANDRO SCARLATTI AND THE NEAPOLITAN SCHOOL.

=The Neapolitan School=.—What in the Venetian school had been a _reaction_ in favor of _form_ and _melody_ became the established practice of the Neapolitan school. Political disturbances had hindered the spread of the Opera in southern Italy, particularly in Naples, but at the end of the 17th century it assumed the position formerly occupied by Florence and Venice. Before this, however, a strong influence had been exerted by certain composers in Rome, of whom Carissimi was first in importance. Had it not been for the disapproval of the Church, a definite Roman school might have arisen. Such a school would doubtless have been advantageous to the artistic growth of the Opera, since the public taste at Rome in matters of art was more serious in nature than at Naples. In 1697, public performances of opera were forbidden by the ecclesiastical authorities, and thus the seat of further development was transferred to Naples through the removal thither from Rome of =Alessandro Scarlatti= (1659-1725), the founder

of the Neapolitan school. As a lad, he had been a pupil of Carissimi and also probably of Legrenzi, whose influence is clearly seen in his early works.

=Alessandro Scarlatti=.—Scarlatti invested his operas with a melodic charm and a symmetrical form which thus far had appeared only sporadically. Fascinated by the freedom of the new style, the early composers had neglected the severe study which had been indispensable to mastery in the Contrapuntal School, and had in the main relied on natural gifts. Following the ideal of Peri and his associates, their operas were largely a succession of recitatives which in the end grew monotonous and wearisome; of form, of structure, of purely musical effect they bore but slight traces. Scarlatti saw that the time had come for a change in style—one that should combine the musical interest of the old with the dramatic spirit of the new. The foremost musician of his time, he perceived the weakness of the exclusively declamatory opera—its lack of variety and want of appeal to the public in general.

[Illustration: ALESSANDRO SCARLATTI.]

=His Characteristics=.—He was not a reformer. He lacked the strong and rugged dramatic fibre of his predecessor, Monteverde. Scholarship; an inexhaustible fund of melody, pure, polished, refined; a gift of characterization—general, not particular, and always subordinate to a keen sense of beauty—are his distinguishing characteristics. He fell in with the taste of the day and devoted his gifts to the production of works which should satisfy the musician and please the public. The solidity of his early schooling had made him a master of counterpoint, and this he applied in the construction of logically worked-out accompaniments, fuller, richer and more expressive than had been attempted by his less learned contemporaries. In nobility of conception and skill in solving contrapuntal problems he often shows that he is not unworthy the name of the “Italian Bach,” as he is sometimes called. Like Bach, also, he was one of the most prolific composers of all times. He left one hundred and fifteen operas, sixty-six of which are still extant, more than two hundred masses, besides many miscellaneous works for church and concert, both vocal and instrumental.

=His Services to the Opera=.—To the simple recitative (recitativo secco), invented by Peri, he added the important form known as the _recitativo stromentato_ (accompanied recitative). This was not strictly original with Scarlatti, since it had been introduced by Purcell in his _Dido and Eneas_ ten years before the Italian had first used it in his opera _Rosaura_ (1690). There is no probability, however, that Scarlatti was acquainted with the Englishman’s works; it is a not uncommon matter for two minds to arrive independently at the same result. In the accompanied recitative, the voice, instead of being supported by detached (_secco_) chords on the harpsichord, sometimes with the addition of a single stringed instrument, as in the simple recitative, was accompanied by the entire orchestra, which had grown to proportions undreamed-of in Peri’s day. Vastly developed by the growth of orchestral resources, it is the distinguishing feature of the modern music drama. As a rule, however, it was but little used in Scarlatti’s operas or in those of his contemporaries. Interest in the drama, as such, was fast sinking to a negligible quantity; audiences assembled to hear their favorite singers, not to follow the course of a more or less involved dramatic action. The simple recitative was, therefore, more frequently employed in order to hurry through the necessary details of the play and reach the moment when the singer could delight by his art in the aria.

[Music: AIR FROM SCARLATTI’S OPERA “TURNO ARICINO”.]

=The Aria=.—Scarlatti was not the inventor of the aria or air for the single voice in the meaning of the term as applied to a certain fixed form. Other composers had used it before him in its essential principles, but he was the _first_ to _formulate_ it into a persistent _type_, which it retained for nearly a century, despite its undramatic character. The Scarlatti aria consisted of three parts: two contrasting sections, concluding with a Da Capo or repetition of the first, expressed by the formula A B A. The principle of Repetition as an element of form is now a commonplace, but at the time it was a novelty, and the emphasis given to it by the aria fascinated the public and made it the principal feature of the opera. More than anything else, it led to its degeneration. Singers found in the aria a means of displaying their technical skill; it became the canvas on which they embroidered the most astonishing _tours de force_. The art of acting almost disappeared from the operatic stage; the poise of body and voice required for such vocal efforts banished all but a few conventional gestures.

=The Overture=.—Scarlatti’s powers were by no means confined to writing for the voice; the instrumental portions of his works give evidence of equal mastery, though the popular taste for singing allowed him but little scope for extension in this direction. His overtures in particular show a great advance over the simple preludes of the early Italian operas. He perfected what is known as the Italian Overture in contradistinction to the earlier form invented by Lully, and called the French Overture. It consisted of three movements, the first and last quick, the middle movement slow. In its arrangement, this was the direct precursor of the modern symphony. At first the two terms were interchangeable; an overture when played before an opera was called a _Sinfonia_, and

curiously enough, when played independently as a concert number it was frequently called an overture. Some of the early symphonies were even printed with one title outside and the other inside.

=The Typical Italian Opera=.—Thus at the beginning of the 18th century we find the Opera on an overwhelmingly musical basis instead of the oratorical foundation which it had in its inception. Scarlatti fixed its form for a century. He left it consisting principally of recitatives and arias, each opera containing from fifty to sixty of the latter. Aside from these there was but little formal music—only an occasional march or dance besides the overture. The simple recitative was used for ordinary dialogue; hence it was peculiarly applicable to the _Opera Buffa_ (comic opera). The accompanied recitative was reserved for situations of dramatic importance, and the aria served to express individual emotion. The chorus was employed but sparingly, generally appearing only at the end of the act to give greater eclat to the finale. The dance, which in the early Opera had played a part of some importance, was finally banished entirely from the scene, though not from the stage. It was given between the acts as an intermezzo (interlude), and thus developed into the formal ballet. Spectacular features, too, assumed great prominence.

=The Intermezzo=.—The Intermezzo has a close connection with the opera. It arose from the custom of introducing something _between the acts_ of a play or opera to entertain the audience during the necessary period of waiting. At first, songs or madrigals were sung, then by degrees the entertainment took on a dramatic form, until at last a drama was given totally independent of the principal play. Singularly enough, the acts of the two plays were performed alternately, neither having any connection with the other. The Intermezzo was always of a gayer, lighter character; thus when the incongruity of the practice became apparent, it naturally evolved into the _Opera Buffa_. This was brought about by the success of the most celebrated comic opera ever written, _La Serva Padrona_ (The Maid as Mistress), by =Giovanni Pergolesi= (1710-1736). This was originally produced (1734) as an Intermezzo between the acts of another play, and afterward made a triumphant progress through all the opera houses in Europe as an independent work.

=The Opera Buffa=.—Though for the sake of contrast, comic characters had been introduced into the opera during the early Venetian period, the _Opera Buffa_ did not reach its full development until the following century. Owing to the absence of certain conventions which had grown around the _Opera Seria_ (serious opera) it became a more characteristic mode of expression than the latter. Its melodies were fresher, its dramatic action was less restrained and truer to life, while it performed a valuable service by doing away with the strange mingling of comic and serious styles which had previously disfigured many otherwise impressive works. To it we owe the concerted Finale which is such a feature of modern grand opera. It is attributed to =Niccolo Logroscino= (1700-1763), who instead of the customary conclusion of an act by a simple duet, trio, or quartet, brought all the _Dramatis Personæ_ on the stage to take part in a characteristic ensemble. Greatly developed by later composers, such finales were for a long time confined to _Opera Buffa_, until Paisiello finally introduced them into serious opera.

=Prominent Composers of the Neapolitan School=.—It is hardly possible to mention more than a few of the numerous composers belonging to the Neapolitan school. Besides Pergolesi, the most important works of this school were composed by =Niccolo Porpora= (1685-1767), =Niccolo Jommelli= (1714-1774), =Niccolo Piccini= (1728-1800), =Giovanni Paisiello= (1741-1816) and =Domenico Cimarosa= (1749-1801). Most of these were equally at home in the _Opera Seria_ and the _Opera Buffa_, but their works in the latter style have proved the more enduring.

Porpora is more noteworthy for the singers he formed than for his forty-six operas, all of which have sunk into oblivion. He was the greatest of the many masters of singing who through their pupils made the Opera of the 18th century the field of display for the most remarkable singers the world has ever heard. Jommelli was one of the most gifted composers of his day. He spent fifteen years in Germany as capellmeister to the Duke of Wurtemburg, but the influence of this long residence in a country where musical ideals were of a more austere type than in Italy, though it added dignity and solidity to his art, was fatal to his popularity when he returned to his native land; his countrymen found his operas heavy in style and deficient in melody. Piccini was the composer of the most popular _Opera Buffa_ of the century, _Cecchina_, but is now remembered principally by the bitter feud which arose in Paris in 1787 between his admirers and those of Gluck. Paisiello's most celebrated work was _Il Barbiere di Siviglia_ (The Barber of Seville), which held the stage for thirty years until the success of Rossini's masterpiece on the same subject forced it into retirement. Cimarosa's _Il Matrimonio Segreto_ (The Secret Marriage) was an equal favorite; one of its numbers, the trio for women's voices, _Ti Faccio un Inchino_ (I make thee a reverence), sometimes appears on modern programs.

=Influence of the Neapolitan School=.—Notwithstanding the formalism of the Neapolitan school, which led to a regrettable neglect of the dramatic signification of the Opera by an over-emphasis of its musical element, it was of no small importance in the development of music in general. By fixing the principles of form and melody at a time when both were vague and undetermined,

Scarlatti laid the foundation of the great classical period, beginning with Haydn and Mozart and ending with Beethoven. This was his contribution to absolute music, which cannot exist without form, though its influence was disastrous to purity of form in the branch of the art which he particularly cultivated.

QUESTIONS AND SUGGESTIONS.

Which Italian city now became the centre of operatic development?

Who was the founder of this new school?

Tell about his style and training.

What did he contribute to the development of the Opera?

Describe the Aria.

Describe the Overture.

Describe a typical Italian Opera.

Describe the Intermezzo.

Describe the Opera Buffa.

Who were the prominent composers of the Neapolitan school?

What was the influence of this school?

The period of Scarlatti's work extends approximately from the English Revolution of 1688, which drove James II from the throne, to the end of the reign of George I. In American Colonial history this period is one of gathering strength in the various provinces on the Atlantic Coast.

LESSON XX.

SINGING AND SINGERS.

=Early Methods of Singing=.—As has been noted by the reader, music, up to this time, developed principally along vocal lines. We have no details as to the character of the training of singers among the Chaldeans, Egyptians and Greeks except such as indicate that their idea of singing was a sort of musical declamation. Such seems also to have been the idea of the nations in the north of Europe.

We have seen that the Welsh bards were required to undergo a very thorough and exacting course of study, but the practical side of singing and the rules laid down for the training of the young minstrels is not a part of our knowledge. The songs of the early Church, sung by masses of worshipers, were of necessity simple in every way, requiring no art. It was not until the use of Discant became popular, and the Polyphonic school began to use florid writing that we can infer that there must have been some methods of training vocalists for artistic work. Although we have little or no details as to the course of training which the early singers received, we are justified in assuming that they must have possessed skill in execution of no mean order. It must not be forgotten that practically all the composers of the early Polyphonic school were singers, able to execute their own works. Hence, studies in singing must have gone hand in hand with composition. The voice parts of the masses, motets and madrigals of the composers of the 13th to the 16th centuries have absolute independence of progression, syncopations, embellishments, etc., to such an extent that it taxes the musicianship of the chorus singer of the present day to sing them; they are not only exacting in intonation, rhythm and other musical matters but also in mechanical points, such as flexibility and freedom of voice and thorough breath control.

=Influence of the Opera on Singing=.—When the Opera was established, after the declamatory style offered by the first composers had proven unsuccessful in holding the public, the florid style of the old discanters was revived and modified, which, as the Opera

developed, gave a great impetus to a systematic and thorough study of singing. The new style of melody introduced by the opera composers of the 17th century demanded purity of voice, wide range, flexibility, expressive shading and a marvelous breath control, as well as great physical endurance. Singers were expected to execute the most intricate passages, abounding in diatonic and chromatic scales, arpeggios, turns, gruppettos, trills, etc., of the most elaborate nature, passages such as are considered purely instrumental today. =Alessandro Scarlatti=, the composer, and himself a singer, is credited with having had much to do with the great development in the art of singing. He trained a number of singers and pupils, and thus founded the “old Italian” school of singing. It was natural that the art side of singing should thus develop in Italy for several reasons, notably, because Italy had a great number of highly-trained composers, the character of the language is such as to lend itself to the requirements of artistic singing, broad full vowels, soft consonants, absence of final consonants, etc., and the enthusiastic, essentially lyric temperament of the race.

=The Training of a 17th Century Singer=.—We are given an idea of the course of training which singers of the 17th century were obliged to observe in a work _Historia Musica_, published by G. A. A. Buontempi, in 1695. This contains an account of the regulations of a school for singers in Rome, directed by Virgilio Mazzocchi, in which Buontempi was a pupil: The pupils were obliged to devote one hour each day to the singing of difficult passages with the idea of acquiring experience; one hour to the practice of the trill, one to passages in agility, one to literary studies, one to vocalises and to various other technical exercises under the direction of a teacher and before a mirror to acquire the certainty that the singer did not make a faulty movement of the face, the forehead, the eyes or the mouth. This was the morning’s work. In the afternoon, a half-hour was given to theory study, the same amount to writing counterpoint on plain-song melodies, then to learning and applying the rules of composition (writing on an erasable sheet); then followed a half-hour of study of a literary nature, and the rest of the day was given to practice on the clavichord, to the composition of a psalm, motet, canzonetta, or any other kind of piece according to the pupil’s choice. Such were the common exercises of those days when the pupils were kept on duty at the school. On other days, they would go outside the Angelica Gate to sing against the famous echo that was found there, listening to the response in order to criticise their work. Other duties were to sing in nearly all the musical solemnities of the various churches, to study attentively the style of the great singers of the day, to make a report of their observations to their master, who, the better to impress the result of their studies upon the minds of his pupils, added remarks and advice as he deemed necessary. Under such discipline it is not astonishing that the Italian singers attained a high degree of excellence, and became not only distinguished singers but skilful composers as well. That the reader may gather an idea of the character of passages executed by these singers an example is given on the previous page.

[Music: AIR for BASS

FROM A “MISERERE” BY DENTICE, END OF 16TH CENTURY.]

=Growth of the Florid Style=.—As the art of singing developed, the singers increased their capricious embellishments. With the idea of securing brilliancy as well as the hope of winning success for their works, composers yielded to the exactions of singers and the depraved taste of the dilettanti. This explains the seemingly endless vocalizing and those passages of pure agility which crowd the scores of the best Italian masters of the 17th and 18th centuries. Before giving some account of the famous singers of the old Italian school it will be interesting to have a few notes upon a work on vocal music which bears upon the matter of execution.

=A Work on Singing=.—In 1725, =Pier Francesco Tosi=, a renowned singer (born about 1650, died 1730), published a work, translated into English, and published in 1742 under the title “Observations on the Florid Song, or Sentiments of the Ancient and Modern Singers,” which contains some interesting and valuable statements for the student of the history of the art of singing. The most minute principles are set forth with much grace and spirit, in all cases showing enthusiasm on the part of the author for his art and a high sense of the dignity of the profession of singing. When the discussion is in regard to certain kinds of passages in which the singer was accustomed to improvise ornaments, Tosi demands the union of five qualities: intelligence, invention, meter (rhythm), mechanism (technic) and taste; and in addition, other qualities which he calls “secondary and auxiliary graces”: the appoggiatura, the trill, the portamento di voce, phrasing. This work by Tosi and one by Marcello entitled _Le Theatre à la Mode_ throw much light on the execution of the vocal music of the 18th century.

=Seventeenth Century Singers=.—=Baldassare Ferri= (1610-1680) was one of the most renowned of the male sopranos of the old school. His voice had the greatest agility and facility, perfect intonation, a brilliant shake or trill and his breath supply seemed to be inexhaustible. In regard to his intonation, it is said that he was able to ascend and descend in one breath a two-octave scale with a continuous trill without accompaniment with such perfection of intonation that when he finished he had not varied a shade from the pitch of his starting-note. He was in high favor in the courts of Poland, Germany, Sweden and England. A medal was struck in his

honor. =Antonio Bernacchi= (1690-1756) was a pupil of =Pistocchi= (1659-1720), the most celebrated teacher in Italy at this time, whose principles are represented in Tosi's book. He commenced his career early and appeared in opera in Italy, later in England and Germany. After some years of experience with the public taste he altered his style, making great use of the florid style, a veritable embroidery of roulades, an innovation that was so successful as to be immediately followed by other singers in spite of the protests of the older school of singers. It is related that when Pistocchi heard his former pupil, he said: "Ah! woe is me! I taught thee to sing and now thou wilt play!" He sang in Handel's opera company in London, 1729-30. He then returned to Italy to take up the career of a teacher and brought out a number of fine singers. =Francesco Bernardi Senesino= (1680-1750) was a great favorite in England, where he sang in Handel's operas. His voice was exceptionally fine in quality, clear, penetrating and flexible, his technic remarkable; his style was marked by purity, simplicity and expressiveness, and his delivery of recitative was famous over all Europe. The name of Niccolo Porpora was mentioned in connection with the opera as a celebrated singing master as well as composer. No singers before or since have sung like his pupils, notably Caffarelli and Farinelli.

=Gaetano Majorano Caffarelli= (1703-1783)—the reader will note that many of the old school of musicians lived to a ripe old age—was the son of a Neapolitan peasant, who tried to repress the boy's evident musical inclinations. Cafaro, director of the Chapel Royal, at Naples, chanced to hear him sing and succeeded in getting charge of him and gave him his elementary instruction, which was followed by instruction from Porpora, who was then living in Naples. Porpora was a most exacting teacher, requiring implicit obedience and unceasing practice. The story is told that Porpora kept Caffarelli for five or six years to the unvaried study of a single page of exercises despite the pupil's most strenuous objections. At the end of the time, when Caffarelli declared he would submit no longer, the old teacher said: "Go, my son. I have nothing more to teach you. You are the greatest singer in Europe." When he first appeared in opera he sang female parts, for which his beautiful face was well-suited. Some years later he took men's parts. He gained great popularity in the leading cities of Europe and amassed an enormous fortune. He excelled in slow and pathetic airs, yet he was most admirable in the bravura style, and his technic in the trill and chromatic scales was unapproached by any other singer of his time. He was fond of introducing chromatic passages in quick movements.

=Farinelli= (1705-1782), whose real name was Carlo Broschi, was a pupil of Porpora. He made his first public appearance in Rome when he was seventeen years old. It was on this occasion that he sang the famous aria with trumpet obligato, written by his master, a piece which became so associated with him as to be demanded at all his concerts. In this piece, trumpet and voice vie with each other in holding and swelling a note of extraordinary length and volume; when the trumpeter had exhausted his breath Farinelli kept on with increased power and ended with a great vocal display. This aria called for wonderful vocal technic owing to the novelty and difficulty of the trills and variations introduced. In 1727, he engaged in a musical duel with Bernacchi, previously referred to, in which he was conquered. As a result of this he placed himself under Bernacchi's instruction, and thus perfected his wonderful talent. In 1731, at the suggestion of the Emperor Charles VI, he modified his style and devoted study to the mastery of pathos and simplicity. During his public career he won the greatest possible success in the European capitals and passed the last years of his life in wealth. Mancini, a fellow-pupil of Farinelli and later a famous singing master, says of Farinelli's voice: "It was so perfect, so powerful, so sonorous and so rich in its extent, both in the high and the low parts of the register, that its equal has never been heard in our time.... The art of taking and keeping the breath so softly and easily that no one could perceive it began and ended with him. The qualities in which he excelled were the evenness of his voice, the art of swelling its sound, the portamento, the union of the registers, a surprising agility, a graceful and pathetic style and a shake as admirable as it was rare."

A few other singers of this class may be mentioned: Giacchino Conti, called =Gizziello= (1714-1761), =Giovanni Carestini= (1705-1758?) a contralto, =Giuseppe Boschi=, the most celebrated basso of the 18th century, one of Handel's singers, and =Girolamo Crescentini= (1766-1846). So much space has been given to these singers because their work laid the principles for vocal training that have ever since been the foundation upon which the great masters and singers of later times have built their art; to these principles has been given the name of the old Italian School of Singing.

=Ill-effect of Virtuosity=.—The student who goes fully into the subject of the relation of singers to the opera will find that the great development of virtuosity among singers exerted an ill-effect and called forth a very pronounced reform in which Gluck was the leader. Singers were capable of such great vocal display, and the public showed so much enthusiasm for the brilliant feats of vocalism, and so great was the rivalry between singers and their partisans that composers vied with each other in their efforts to introduce the most difficult and florid passages possible. The text of an aria had no real value and became merely a vehicle upon which to place the dazzling vocalization of the singer. Dramatic truth was ruthlessly sacrificed. A singer, supposed to be in the very throes of death, would give a virtuosic display that would tax the lung power of a man in the most perfect physical condition. Gluck's reform consisted in requiring that the arias should express the emotions suited to the situation, thus calling for expressive singing,

not mere vocal display. The history of the opera and singing since then shows periods of change toward one idea or the other until the principles of Richard Wagner as to dramatic truth were generally accepted.

QUESTIONS.

What circumstances show that the church singers of the 13th to 16th centuries must have had considerable skill in singing?

What was the influence of the opera on singing?

What was the course of training required of young singers in the 17th century?

What important work on singing dates from the early part of the 18th century? Give some of its principles.

Describe the celebrated singers of this period and their work.

What was the influence of vocal virtuosity on music?

LESSON XXI.

OPERA IN FRANCE AND ENGLAND.

=Spread of Italian Opera=.—The fame of Italian opera soon spread to other countries. Princes and kings, eager to hear the new style of music, held out golden inducements to Italian composers and singers to come to their courts; it was generally thought that none but an Italian could compose an opera or sing an aria. The consequence was that in almost all countries during the 18th century the prevailing musical influence was Italian; native composers and singers were obliged to study Italian models if they wished to attain to popular favor. In France, however, this influence was only sufficient to _modify_ without obscuring the features of an essentially national school. Independence in matters of art has always been a marked characteristic of the French; they have led rather than followed. The most distinguished names in the history of French opera have been those of foreign birth, but whatever their nationalities, all give evidence of the effect exerted upon them by the definite form, the clearness of dramatic intention demanded by the canons of French taste.

=Origin of French Opera=.—As the Italian opera was derived from the classical tragedy, so the _French opera_ had its _origin_ in the _Ballet_, the favorite form of amusement in France. The French Ballet of the 17th century was by no means confined to the dance; it was a heterogeneous mingling of dances and dialogues, songs and choruses, corresponding to the English Masque. Like the early operas in Italy, their spectacular features were on a large and expensive scale, which confined them to occasions of especial festivity at court or among the nobility. The taste for dancing had much to do with the direction taken by the opera in France; it is still characteristic of the French school, as is shown by the prominent place given to the ballet in the Grand Opera.

=Lully=.—The founder of the French school, =Jean Baptiste Lully= (1633-1687), was Italian by birth, but at the age of thirteen he was taken from his native city, Florence, to France, as a page in the service of the Chevalier de Guise. His musical gifts soon won him a place in the royal band and finally the post of court composer. He first wrote ballets in which the King (Louis XIV) himself danced, and later turned his attention to the opera.

=Italian Opera in France=.—Italian opera had already been heard in France. Through Cardinal Mazarin, an opera company from Venice had visited Paris in 1645, and two years later Peri's _Euridice_ had been given also by a Venetian troupe; but these and later performances had aroused no attempts at imitation by French composers. They contented themselves with writing ballets which were performed as intermezzos between the acts of Italian operas in order to bring them nearer the French standards of taste. The superior vocal ability of the Italians was acknowledged, but the lack of rhythmic form in their music made an unfavorable impression. The king was passionately fond of dancing; he and his courtiers frequently took part in the ballets produced at court, hence the interest lay in the drama as illustrated by the dance rather than by song.

=Beginning of French Opera=.—The first French opera to receive public performance was _Pomone_ (Pomona), in 1671, by =Robert Cambert= (1628-1677), who had previously written several others which had been performed only in private. It awakened

much more interest than the Italian operas which thus far had been heard in Paris, and incited Lully to the composition of his first opera, _Les Fêtes de l'Amour et Bacchus_ (The Feasts of Love and Bacchus), which was produced the following year. From that time until his death he composed fifteen operas, which determined the form of French opera for practically a century.

=Characteristics of Lully's Operas=.—Lully's operas, like those of the Florentine school, were on the whole _declamatory_ in style, and like them their subjects were generally taken from classical mythology. They are destitute of the sustained melody which appeared somewhat later in the Neapolitan school; but the recitatives are so skilfully varied in rhythm and show such intimate knowledge of the genius of the French language that in dramatic effect they are far superior to those of the earlier school. To the overture, the ballet, the chorus, he assigned music of a different type, rhythmic and formal in nature, thus relieving the monotony of an exclusively declamatory style. A master of stagecraft, his operas abounded in cunningly-devised spectacles and original scenic effects which excited wonder and held the attention. In short, so far as the means of the times allowed, we find in the Lully operas the well-considered balance between the musical and dramatic elements still characteristic of the French school.

=The French Overture=.—One of Lully's greatest services was the elaboration of the Overture into a larger and more dignified form. The Italians had never paid much attention to the overture. At first it appeared only as a _brief instrumental prelude_, sometimes but a few measures in length. The introduction to Monteverde's _Orfeo_, for example, consists of only nine measures which the composer directs to be played over three times to serve as overture. Later it was somewhat _extended_ in length and provided with some regularity of design, but the Overture as a fixed form dates from Lully. It began with an impressive slow movement, followed by an Allegro in fugue style. Sometimes this was all; but it generally concluded with another slow movement, often one of the stately, dignified dance tunes of the day, and often merely a repetition of the Introduction. This form was known as the French Overture, and was soon adopted by composers of all nationalities. About the middle of the 18th century it was supplanted by the Italian Overture, perfected by Scarlatti, and described in Lesson XIX.

=The Prologue=.—The overture was commonly followed by a Prologue. This had nothing to do with the action of the drama; it introduced mythological and allegorical characters who danced and sang, often paying the most fulsome adulation to the king, who was compared to the most celebrated heroes of mythology and antiquity. After the prologue, either the overture was repeated, or another and a shorter one was played. This pseudo-classical type of opera naturally flourished in the artificial atmosphere of the court on which it was dependent for favor. It lasted until the time of Gluck, when the influences which led to the great uprising of the people in the latter part of the 18th century swept it away with other traditions and conventions.

=Rameau=.—Until we come to =Jean Philippe Rameau= (1683-1764), none of Lully's successors succeeded in definitely extending the limits he had fixed. Rameau had won the name of the first theoretician of the day, and was a man of fifty when his first opera, _Hippolyte et Aricie_, was produced. Even he made no essential change in the scheme established by Lully beyond greatly enlarging the sphere of the orchestra, originating novel rhythms and bolder harmonies. This was, however, a long step in advance, since it saved the opera from sinking to the level of a dull, mechanical imitation of Lully's methods, into which contemporary composers had fallen.

=The English School=.—Italian music, in the form of the Madrigal, had been popular in England since the time of its introduction in 1598, by =Thomas Morley= (1557-1604). Native composers immediately took it into favor, a favor it has never lost; madrigals are still composed and sung in England, though elsewhere the form has been dead for nearly two centuries. The declamatory opera of the early Italian school, however, never took root. It was, as we have seen, primarily a drama in which music played a secondary part, and as such it was far too crude and lacking in human interest to appeal to a public accustomed to the plays of Shakespeare and his contemporaries, and whose taste in music, moreover, was rather for melody than for recitative. Then, during the Protectorate, the Puritanical spirit which led to the destruction of church organs and for a time forbade all theatrical performances proved an insuperable obstacle to any development of dramatic music.

=The First English Operas=.—In 1656, Sir William Davenant, the playwright and theatrical manager, evaded this prohibition by introducing music into his plays and calling them operas. Much of this music, which was in the form of incidental songs, choruses and instrumental interludes, was written by =Henry Lawes= (1595-1662) and =Matthew Lock= (——d. 1677). The latter is well known for his music to "Macbeth," which up to within a few years was not infrequently heard in performances of the tragedy. These so-called operas had little or no effect on the development of a native school. They are principally noteworthy in being the first English operas and the first theatrical performances in England in which women appeared on the stage. Previously the parts of women had been played by boys.

=Influence of the French School=.—At the Restoration in 1660, Charles II found the prevailing style of music in England but little to his taste. Fond of the gay measures and lively dances of the French opera, in 1664 he sent =Pelham Humfrey= (1647-1674), the most talented of the boys forming the choir in the Chapel Royal, to Paris to study with Lully. Three years later he returned, and became the teacher of England's greatest composer.

=Henry Purcell=.—This was =Henry Purcell= (1658-1695), one of a family of musicians of whom he stands first. As a child he is said to have composed anthems while a chorister in the Chapel Royal, and at the age of twenty-two he composed his first opera, _Dido and Eneas_, a most remarkable work for a youth of his years. It is the only one of his dramatic works in which there is _no spoken dialogue_, its place being supplied by recitative, and therefore, strictly speaking, it was his only opera. He can never have seen an opera of this type; his acquaintance with the new style must have been largely based on what Humfrey had told him of such performances in Paris, though it is possible that he had the opportunity of studying Lully's scores. In its union of dramatic feeling and characterization with depth of musical resource, _Dido and Eneas_ was far in advance of anything that had yet appeared in France or Italy. Though it shows the influence of the French school, the sturdy English character which distinguishes all of Purcell's music is plainly apparent.

[Illustration: HENRY PURCELL.]

=Purcell's Dramatic Works=.—It was followed by a large number of works for the stage, but these were in the main merely incidental music for dramas; among them Shakespeare's "Tempest," "Midsummer Night's Dream" (known as The Fairy Queen), Dryden's "King Arthur," the last being the most important and extended in form. Unfortunately, many of them have been lost; but enough remain to show that in Purcell's early death England lost the most original musical genius she ever possessed. He founded a distinctly national school which, for the lack of a successor of equal gifts, was destined to succumb to foreign influences.

=Their Characteristics=.—His melodies bear the freshness and spontaneity of the English Folk-song at a period when music was generally cultivated, before civil wars and religious bigotry had crushed the art spirit which, during the 16th century, had made the English people the leaders in musical progress. His recitatives show a vigor and an intuitive perception of dramatic effect unsurpassed by any of his contemporaries on the Continent. He was an accomplished contrapuntist and applied his knowledge of counterpoint with admirable results to sacred music, yet never allowed it to become obtrusive in his dramatic works. In these clear, expressive melody and vigorous declamation were the distinguishing features; his learning served only to secure a natural flow of the one and an appropriate setting for the other.

=The Masque=.—The precursor of the English opera was the Masque. Like the French Ballet, this was a dramatic entertainment consisting of dialogues, dances, songs, and choruses. The subject was allegorical or mythical in nature and the mounting of the most elaborate description. The leading poets and dramatists of the day wrote many masques. The most famous was Milton's "Masque of Comus," the music by Lawes, which was performed at Ludlow Castle in 1634. The music in these masques was at first designed merely to give variety to what was in the main a pleasure to the eye, but Purcell relieved it of this subordinate character by investing it with a weight and authority which made it an integral factor in the dramatic expression.

=Typical English Opera=.—He thus fixed the form of the _English opera_ as a _play with songs, choruses, ensembles_, etc., connected by _spoken dialogue_ instead of recitatives. The music, therefore, instead of carrying on the action, is confined to the more quiet situations of the drama, such as are naturally adapted to lyrical expression. The inflexibility of this form has doubtless had much to do with the lack of development in the English School of Opera compared with the remarkable growth of other schools which have abandoned the union of the spoken with the sung word in the serious opera.

=The Ballad Opera=.—The only characteristic creation of the English school is the Ballad Opera. This had its origin in "The Beggar's Opera," produced in 1728. Slight in texture, it was simply a play with songs set to the most popular ballad tunes of the day. Its extraordinary success in the face of the financial failure of Italian opera left no doubt as to the real taste of the English people, and was decisive as to the direction taken by later composers, such as =Sir Henry Bishop= (1786-1855), =Michael Balfe= (1808-1870), =Arthur Sullivan= (1842-1901).

QUESTIONS AND SUGGESTIONS.

What circumstances attended the spread of the Italian Opera?

Which European country was the next to take up Opera?

Who was the founder of this new school?

What efforts had been made prior to his appearance?

Describe Lully's opera form.

Describe the French Overture.

Describe the Prologue.

Who was Lully's successor?

What prevented the spread of the principles of the early Italian Opera in England?

Give names of men connected with the early history of Opera in England.

Give an account of Purcell and his works.

What was the Masque?

Describe the typical English Opera. The Ballad Opera.

The pupil will note that the development of French Opera took place in the reign of Louis XIV, and that it was after the restoration of Charles II in England that opera began there, Purcell's work ending with the close of the 17th century.

LESSON XXII.

THE OPERA IN GERMANY. HANDEL AND GLUCK.

=Opera in Germany=.—The introduction of the opera into Germany dates from 1627. In that year a German translation of Rinuccini's _Dafne_, which, it will be remembered, was the text of Peri's first opera, was set to music by =Heinrich Schuetz= (1585-1672) and performed on the occasion of the wedding of the Landgraf of Hesse. Schütz, who also composed the first German oratorio, _Die Auferstehung Christi_ (The Resurrection of Christ), had been sent by the Landgraf to study in Italy in 1609, only two years after the production of Monteverde's _Orfeo_. The score of his _Dafne_ has been lost, but it was doubtless in accordance with the principles of the Florentine school. The Thirty Years' War and its lamentable consequences prevented any immediate development of the new form. Occasional productions of Italian opera were given in several German cities, but it was not until the establishment of the Hamburg opera late in the century that the new musical movement gained a permanent footing in Germany. Even then its popularization proceeded but slowly.

[Illustration: HEINRICH SCHUETZ.]

=German Composers Barred=.—It is true that not long after the beginning of the 18th century, great interest was manifested in Italian opera at a number of courts, Berlin and Dresden in particular, but this had _no influence_ in the formation of a _national school_. Its effect indeed was the exact contrary. Singers and composers were brought from Italy; among the cultivated classes opera in German was considered a barbarism, so that native musicians met with little or no encouragement in this field. They were obliged to write their operas to an Italian text if they wished a hearing for them; the Church alone was freely open to German composers. The Church, too, was the only place where the people could hear music; public concerts were unknown and, save at Hamburg, the opera could be heard only by invitation to those who had entrée to court circles. This led to the remarkable activity in the production of sacred music which is such a feature of that period. This also, as shown by the early history of the Hamburg opera, was more in consonance with German character than the light, ephemeral operas which ruled the Italian stage.

=Characteristics of the Early German Opera=.—The Hamburg opera house was opened in 1678 with a Biblical _Singspiel_ (literally song-play) of an allegorical nature, _Adam und Eva; oder der erschaffene, gefallene und wieder aufgerichtete Mensch_ (Adam and Eve; or the Created, Fallen and Redeemed Man) by =Johann Theile= (1646-1724) a noted organist of the day and a pupil of Schütz. This was the first performance of a German opera on a public stage. The _Singspiel_ corresponds to the English ballad

opera in being a series of songs, ensembles, etc., mainly of a simple nature, connected by spoken dialogue. The curious taste of the time is shown by the choice of subject; the work itself was a survival of the Miracle Plays and Mysteries of the Middle Ages. It begins with the creation of the earth, which is formed out of chaos by characters representing the four elements; the Almighty descends by means of a flying machine and calls man into being; Lucifer succeeds in his temptation of Eve to the great joy of demons who sing an exulting chorus, etc. As the Italians took the subjects for their early operas from classical mythology, so the _Germans took_ theirs from _Bible history_. _Adam and Eve_ was followed by a series of similar _Singspiele_: _Michal and David_, _The Maccabean Mother_, _Esther_, _Cain and Abel_, and many others.

=Change of Character=.—In time, however, these gave way to operas in the Italian style. The chief agent in this change was =Reinhard Keiser= (1674-1739) who, as composer and manager, brought the Hamburg opera to its highest point. Associated with him was =Johannes Mattheson= (1681-1764), a man of many and varied gifts as singer, composer, conductor, scholar and diplomat, now chiefly remembered by his close relations with =George Frederic Handel= (1685-1759). The latter at the age of eighteen came from his native city, Halle, to Hamburg, then the musical centre of Germany, to continue his studies. Mattheson recognized the youth's genius and opened the way for the performance of his first opera, _Almira_.

=Handel and the Hamburg Opera=.—This, with _Nero_, was given in 1705 with such success that Keiser, jealous of the young composer, set them both to music himself and banished his rival's works from the stage. Handel thereupon withdrew and the year following went to Italy, where he spent several years. His connection with the Hamburg opera was too slight for him to have exercised any influence upon it; then, too, he had not yet reached artistic independence himself, and it is doubtful whether he would have made any change in the direction it was taking toward conventionalized Italian opera. At that time the Hamburg opera was rapidly losing its national character; the style mainly cultivated was that of the Neapolitan school; a tasteless mingling of languages was even allowed in one and the same opera—the recitatives were often sung in German and the arias in Italian. This decadence continued, with a consequent loss of popular favor, until in 1738 opera in German was given up entirely, and Italian opera reigned triumphant in Germany.

=The Conventionalized Italian Opera=.—Handel, on his return from Italy, finally found his way to England, where he made his home for the rest of his life. The series of operas he produced there form the _climax of the type originated by Scarlatti_, which by this time flourished on all stages to the exclusion of all others, save in France, where the ideals of Lully and his school still prevailed. Its chief aim was to afford singers an opportunity to display their accomplishments. To this end the composer directed his attention principally to the production of arias which should correspond to this demand. Exquisitely beautiful as these often were, their preponderance completely obscured the dramatic significance of the opera, and led the singers to entertain grossly exaggerated ideas of their importance. They dictated to composers, refused to sing what in their opinion failed to suit their voices, and in many ways kept the opera from rising above the low artistic level to which it had fallen. To please them, a highly artificial scheme of arrangement was adopted to which the drama was totally subservient. Only six characters were allowed, three men and three women; the arias were strictly classified according to style and assigned to the singers in a certain fixed order; no ensemble beyond a duet was permitted, and the chorus sang only in the closing finale. No matter what the dramatic exigencies might be, adherence to these formulæ was rigidly exacted.

=Handel's Operas=.—Though Handel infused a vigor of spirit and a wealth of characteristic melody into this form of opera, he made no definite attempt to escape its restrictions. Many of his most beautiful creations are buried in operas which are dead beyond possibility of resurrection on account of his acquiescence in the sentiment of his times. That this is not due to lack of innate power is shown by his oratorios.

[Illustration: CHRISTOPH WILLIBALD GLUCK.]

=Gluck and His Reform of the Opera=.—This so-called concert opera reigned with almost undisputed sway until the influence of =Christoph Willibald Gluck= (1714-1787) wrought a momentous change. Persuaded of the low estate to which the opera had been reduced, Gluck stood for a return to first principles; he advocated a ruthless sacrifice of the conventionalities which through the vanity of singers and the love of sensation on the part of the public had grown up around the opera and the placing of it upon its original foundation of the drama. He was a man of mature years when in 1762 he put his theories into practice by the production of _Orfeo_ in Vienna. He had composed many operas in the prevailing Italian style, but his judgment, formed by extensive study and travel, convinced him of the essential weakness of that school: its concentration upon the purely musical element. This he saw made of the opera a puppet-show for the display of vocal art which, great as it was from a technical point of view, was mechanical and meretricious in character. He was not alone in his condemnation; critics and thinkers such as Addison and Steele in England,

Diderot in France, Marcello and Algarotti in Italy had employed the varied resources of wit, satire and reason to expose the follies and inconsistencies of the opera. From the nature of the case, however, they could work no change; most of them were literary men who could criticise but not create.

=Gluck's Travels and their Influence=.—Gluck had traveled much. There was hardly an art-centre in Europe from Copenhagen to Naples which he had not visited for the purpose of bringing out his works. In England, he had heard Handel's oratorios, which profoundly impressed him; in Paris, he had made acquaintance with Rameau's operas. Both of these masters exercised a strong influence over his change of style; the former by his powerful handling of the chorus which had been practically banished from the Italian stage, the latter by his consistent adherence to dramatic truth of expression. He was in addition a zealous student of art and literature in all their phases; he brought to his problem not only the ear of the musician but the intellect of the scholar.

"=Orfeo=."—In _Orfeo_, Gluck took the same stand which Peri had taken in his opera on the same myth a century and a half before: the _illustration of the drama through music_ which should give it a poignancy of expression denied to the spoken word. The later composer had the immense advantage of musical resources undreamed-of at the time of the Florentine opera, but both stand upon the same artistic platform. It was a daring task that Gluck had attempted. Orpheus, robbed by death of Euridice, seeks to regain her by forcing entrance to the place of departed spirits. On his descent to the nether world he is confronted by a band of demons who bar his way, but finally melted to tears by the pathos of his song, they allow him to pass. The composer must make this appeal adequate to the effect; anything less would result in an anti-climax totally disastrous to dramatic illusion. Gluck passed this test triumphantly. Even today this scene remains one of the most powerful known to the operatic stage. _Orfeo_, in its strength and simplicity, was so opposed to the taste of the day that its victory was by no means unquestioned, but it soon won universal recognition and with its successor, _Alceste_ (1767), is the oldest opera heard at the present day.

=Gluck in Paris=.—_Alceste_ was followed by _Paride ed Elena_ (Paris and Helen), but the severity of the new style aroused such a storm of hostile criticism that the discouraged composer turned to Paris with his _Iphigenie en Aulide_ (Iphigenia in Aulis) to a French text after Racine's tragedy. Marie Antoinette, then the wife of the Dauphin, had been his pupil in Vienna, and through her influence the opera was produced, though not without arousing one of the most bitter wars in musical annals. Twelve years before, Italian _Opera Buffa_ had gained a footing in Paris. Its lightness, melodic grace, and witty dramatic situations captivated many who immediately attacked the prevailing type of French opera, of which Rameau was the head, as heavy and unmusical. This opinion was strenuously combated by others who upheld native art. Thus there were two strongly-opposed parties, one defending the Italian, the other the French school of opera. After Rameau's death, the Italian party was in the ascendency, but on Gluck's arrival with a French opera he was taken as the representative of the national school. Piccini, the most popular Italian composer of the day, was pitted against him, but it needed only the production of Gluck's _Iphigenie en Tauride_ (Iphigenia in Tauris) to crush his rival's claims. This was his last great work. He retired to Vienna, which was his home until his death.

=Influence of Gluck=.—The influence exerted by Gluck was far-reaching and permanent. The reform he initiated did not create a school—it did far more; it _profoundly affected all schools_. With no immediate followers among the composers of his time he stood alone, as he stands today, one of the most commanding figures in musical history. His _Orfeo_ marks the beginning of a new era by rescuing a great and important form of art from a decadence which had robbed it of legitimate power and effect. The opera more than any other form of music is dependent upon popular favor for existence. It is therefore peculiarly susceptible to influences which tend to lower artistic standards. Gluck, however, made it impossible that it should ever again sink to the level of the mass of crudities and puerilities from which he lifted it.

QUESTIONS AND SUGGESTIONS.

Give an account of the introduction of opera into Germany.

Why did German composers develop slowly?

Describe the early German opera forms.

Who was the chief agent in a change?

Give an account of Handel's work in connection with German opera.

What had been the influence of singers?

What were the influences to cause Gluck to set about opera reform?

Give an account of "Orfeo."

Why did Gluck go to Paris and what success did he have there?

What was the influence of Gluck upon the future of the opera?

It will be noted that the Thirty Years' War in Germany interfered with the development of the Opera. Frederick the Great's grandfather and father laid the foundations of the Prussian kingdom. In France, Gluck's works carry us up to the period of social and political agitation preceding the French Revolution. In England, the House of Hanover is becoming more firmly established on the throne; in America, the period is that of the struggles between the French and English colonists.

LESSON XXIII.

MOZART TO ROSSINI.

=The Opera after Gluck=.—After Gluck the first great name is that of =Wolfgang Amadeus Mozart= (1756-1791). Haydn had indeed written a number of operas, but they were, in the main, light in character and exercised no influence whatever on the development of the form. At the age of twelve, Mozart had composed two operas, but the first to receive public performance was _Mitridate, Re di Ponto_ (Mithridates, King of Pontus), which was produced at Milan two years later under his own direction. This was followed by others, but these early works do not call for any extended mention. Though they abound in melody and show a maturity remarkable in so young a composer, they were frankly written to please the taste of the time and do not in any essentials depart from the accepted Italian style then in favor, as fixed by Scarlatti and his contemporaries.

=Gluck and Mozart Compared=.—It was not until _Idomeneo, Re di Creta_ (Idomeneus, King of Crete) was brought out during the Carnival season of 1781, that he demonstrated fully the gifts which made him the first dramatic composer of his time. In this he shows a great advance over the conventional opera of the period and an approach to the ideals of Gluck, though neither in _Idomeneo_ nor in any of his later operas did he attempt to embody these ideals in the uncompromising form chosen by the older master. Though contemporaries, no two composers could well be more unlike in character, temperament and methods than Gluck and Mozart. The one, a man of years, ripened through travel and study, conditioned his music according to the requirements of the drama; the other, a youth of no great intellectual endowments aside from his art, but aflame with the fire of genius, felt the drama in terms of music. Thus they approached the task from opposite sides. Not that Gluck was without feeling or Mozart without intellect; it was simply a case of the dramatist and the musician solving the problem each in his own way. At the same time it was impossible that Gluck's theories should be entirely without influence on Mozart. Even a genius must learn from his environment, and Gluck's position, though sharply disputed by the Italian school to which Mozart belonged, could not be ignored by the younger man. Then, too, Mozart had been in Paris during the height of the Gluck-Piccini controversy, and it is known that he had made a close study of _Alceste_, to which Gluck, in the form of a dedication to the Grand Duke of Tuscany, had given a preface containing a clear exposition of his principles of dramatic composition. It is hard to say, however, what direction Mozart's dramatic course might have taken had his life not been cut so pitilessly short and if his outward circumstances had been less constrained. He was obliged to adapt himself to Italian influences which at that time were all powerful.

=The Singspiel=.—As already mentioned, the first attempts at German opera took the form of the _Singspiel_, but it gradually died out during the invasion of Italian opera in Germany. Its revival and development to a higher standard was due to =Johann Adam Hiller= (1728-1804), who received his first impulse through an English ballad opera of a farcical nature, "The Devil to Pay." This was translated into German and given (1743) at Berlin with the original English melodies taken from popular ballads. Hiller set this translation to music and followed it with many others which soon acquired great vogue; one or two, for example, _Der Dorfbarbier_ (The Village Barber), are still heard in Germany. Hiller, though one of the most learned musicians of the day, the founder of the celebrated Gewandhaus Concerts in Leipzig and editor of the first musical periodical ever published, adopted a simple, natural Folk-style in these operettas, as they were also called. Goethe was particularly interested in this revival of a national form of opera; it stimulated him to the writing of the ballads which in turn acted so powerfully in developing the German song under the hands of Loewe, Schubert, Schumann and others.

=Mozart's First German Opera=.—Emperor Joseph II, wishing to establish the _Singspiel_ in Vienna, commissioned Mozart to write a German opera of a similar style. This resulted in _Die Entführung aus dem Serail_ (The Elopement from the Seraglio), and the composer's hopes of founding a national school of opera were high. Unfortunately, he was doomed to disappointment. Though _Die Entführung_ was received with enthusiasm, popular favor was averse to opera in any other tongue than Italian; the German theatre was open only a few years and with the exception of _Die Zauberflöte_, his future operas were composed to Italian texts.

=His Later Operas=.—_Le Nozze di Figaro_ (The Marriage of Figaro—1786), _Don Giovanni_ (Don Juan—1788), _Die Zauberflöte_ (The Magic Flute—1791) rank as Mozart's greatest operas. Considered as music alone, the last reaches a height which gives an idea of what he might have done in nationalizing the opera if he had been spared a score of years longer; but its confused, irrational plot stands in the way of its popularization. The same objection holds good of _Così fan Tutte_ (Women are All Alike—1790), which contains some of his most exquisite music.

=Characteristics of Mozart's Operas=.—Mozart's _conception_ of the opera is that of the _musician_, _not_ of the _dramatist_. This is plain from the indifferent texts he willingly accepted, yet so universal was his genius that he fused the two elements into a complete and consistent whole. Such a union of clearly-cut characterization and musical beauty is unknown in the opera. He made his _characters eternal types_ by means of music so apposite to their individuality that it seems in each case to spring from inward necessity, yet which as music has never been surpassed for intrinsic grace and charm. Italian melody in its best estate on a foundation of German depth and solidity is its distinguishing characteristic. This characterization is confined, however, to details and personages; of the development of the drama as a whole he apparently had but little idea. This, however, was not called for by the taste of the times; the opera was not considered from a dramatic standpoint, save by Gluck and the composers of the French school; the libretto furnished a series of situations suitable for musical illustration, not a consistent and logical dramatic action.

=Their Significance to German Art=.—Mozart marks the highest point reached by the opera of the 18th century; he also _marks the passing of Italian supremacy in Germany_. The Germans were already masters of the other great forms, the Oratorio and the Symphony; Gluck and Mozart captured the Opera also for Germany, though it was not for several decades after Mozart's death that German opera rose from its discredited position at the close of the century.

=Beethoven's Fidelio=.—A mighty impulse was given to the development of a national school by the production of _Fidelio_ (1805), Beethoven's only opera. His two great predecessors had been obliged for the most part to write their operas to French and Italian texts. =Beethoven= (1770-1827), however, showed his independence and sturdy national character by choosing a subject totally alien to the frivolous intrigues which at that time ruled the Viennese stage—a story of heroic, wifely devotion—and composed it to German words and in the German style; that is, with dialogue instead of recitative. Essentially symphonic in character, _Fidelio_ shows the same disregard of vocal limitations which characterizes the Ninth Symphony and the Mass in D. Difficult for the singers, it was still more difficult for the public. In subject and treatment it was above their heads; they turned it the cold shoulder and it soon disappeared from the boards. An appreciation of its greatness was reserved for a later day.

=Italian Composers in France and Germany=.—The popularity of Italian opera outside of Italy led to the expatriation of many Italian composers who exercised a powerful influence in France and Germany. Among these =Antonio Salieri= (1750-1825) deserves mention for his career in Vienna, where he was the successful rival of Mozart in court favor and later the teacher of Beethoven. More important was =Luigi Cherubini= (1760-1842), who found his way to Paris just before the Revolution. A master of the severe contrapuntal school, which was then passing away, Beethoven considered him the first composer of the day for the stage and studied his works zealously. Cherubini was present at the first performance of _Fidelio_, which shows strong traces of the influence exerted upon Beethoven by _Les Deux Journées_ (The Two Days, known in Germany and England as The Water Carrier), Cherubini's greatest opera. The two were on intimate terms during the stay of the latter in Vienna for the purpose of bringing out several of his operas. There was much in common between them; the Italian had the solidity, dignity and nobility of treatment generally associated with the German character. Beethoven's choice of a subject for his opera was doubtless influenced by _Les Deux Journées_; the themes of both are much the same, involving devotion and self-sacrifice of the highest order.

=Spontini and Rossini=.—Another Italian composer who went first to France and afterward to Germany was =Gasparo Spontini= (1774-1851), who with _La Vestale_ (The Vestal) enlarged the sphere of the opera in Paris. Spectacular and pompous in character, sonorous and powerful in instrumentation, it pointed directly to the type of grand opera originated by Meyerbeer nearly a generation later. In 1820, he was summoned to Berlin, where he remained as court composer and conductor for twenty-two years, a period coincident with the most significant development of the German school of opera. Spontini was the last of the many Italians who had for a century and a half borne almost uninterrupted sway in Germany.

The most brilliant and gifted of all these wandering sons of Italy was =Gioacchino Rossini= (1792-1868). As rich in melody as Mozart, though of a less refined type, he owed more to nature than to study. His first successful opera, _Tancredi_ (1813), set all Italy agog with the freshness and vivacity of its airs, and it was not long before he was the most popular composer in Europe. Gifted with prodigious facility—in one period of eight years he wrote twenty operas—his operas ruled all stages and fixed the standard by which all others were judged.

[Illustration: GIOACCHINO ROSSINI.]

=Characteristics of Rossini's Operas=.—They are, on the whole, a _reversion_ to the conventionalized opera of Handel's time in being written for the singer to exhibit his art and not to express the significance of the drama; this notwithstanding their undoubted charm, the many piquant and original touches in rhythm and harmony, the occasional suggestive instrumentation. An intensely _florid style_ is used not only in the _buffa_ school where it can readily be justified, but in operas of a tragic nature where it is manifestly out of place. In _Semiramide_, for instance, a story of battle, murder and sudden death is told in the same rippling rhythms and highly ornamented melodies that illustrate the intrigues of his _Barbiere di Siviglia_ (Barber of Seville), where they are eminently appropriate.

=His Change of Style=.—This is true, however, only of his works composed for the Italian stage. His _Guillaume Tell_ (William Tell), produced in 1829, five years after his arrival in Paris, showed the influence of his new environment by an almost startling change of style. Elevated and dramatic in treatment, shorn of redundant ornament as befits the character of the subject—taken from Schiller's play of the same name—it remains his greatest achievement; at least in serious opera. It was also his last work for the stage. It is not known by what strange caprice he practically closed his career as composer at the age of thirty-nine.

REFERENCE.

Oxford History of Music, Vol. V.

QUESTIONS AND SUGGESTIONS.

Name the most prominent successor of Gluck in opera.

Compare the two.

Describe the Singspiel.

Name some of Mozart's operas.

Mention their characteristics and influence.

Give an account of Beethoven's work in Opera.

Tell about Salieri, Cherubini, Spontini, Rossini.

Give the characteristics of Rossini's operas.

What change in his style is evident in "William Tell"?

We now approach the period preceding the American and the French Revolutions which so greatly affected the masses of Europe, an influence extended by the wars of Napoleon. Music shows traces of the powerful forces at work, losing the former artificiality and becoming more and more, in the hands of Beethoven, an expression of dramatic and personal feeling.

LESSON XXIV.

THE ORATORIO.

=Oratorio in Italy after Carissimi=.—After the beginning made by Carissimi, the next work of importance in Oratorio is that of =Alessandro Scarlatti=, who established the Aria form as explained in the study of the Opera. The composers of the Italian school of the last part of the 17th and the early part of the 18th century used practically the same methods in Opera and Oratorio, the difference being mainly in the character of the text, and in the earnestness or religious feeling of the composer. Scarlatti is also signalized by his improvements in the Recitative, which resulted in several forms made use of by his successors, _Recitativo

Secco_ and Accompanied Recitative. He wrote ten oratorios. Contemporaries whose work should be mentioned are =Antonio Caldara= (1678-1763) and =Leonardo Leo= (1694-1746), a pupil of Scarlatti, who wrote nearly a hundred works for the church, the chief one being the oratorio, _Santa Elena al Calvario_ and a _Miserere_ for a double choir. He was strong in his writing for chorus, making splendid use of the fugal style. Another contemporary of the first rank was =Alessandro Stradella= (1645-1681), whose oratorio, _San Giovanni Battista_ (St. John the Baptist) is a most beautiful work. It contains a free treatment of the accompanying instruments, the arias are clear and well-designed, the chorus writing for five parts is effective as well as ingenious, and the work as a whole shows considerable power of dramatic expression, forming a sort of transition between Scarlatti and Handel. Stradella is said to have been a pupil of Carissimi.

=Oratorio in Germany=.—In Oratorio as in Opera, the style spread to other countries, there, in the case of the Oratorio, ultimately to find a more congenial home; for the Oratorio, in Italy after the time of Stradella, seemed to lose hold on composers and public. The latter did not grasp the fact that the Oratorio had within it one element, the chorus, to give to it a definite individuality. They submitted to the public's preference for solo singing and made up their oratorios largely of conventional arias—thus inviting comparison with the Opera, and reserved their writing in choral form for their works for the Church service, such as psalms, magnificats, masses and motets. In Germany, the attitude of the people toward religious music, doubtless owing to the Reformation as well as to the serious nature of the people, was much more favorable than in Italy. This temperament is shown by the fact that when German composers cast about for themes for their oratorios they seemed to choose the story of the Passion. The oldest example of the German Oratorio is "The Resurrection of Christ," written by =Heinrich Schuetz= (1585-1672), a pupil of Giovanni Gabrieli, which was produced at Dresden in 1623. The narrative portions were committed almost entirely to the chorus. We mention also a setting of the Passion, by =Johann Sebastiani=, published in 1672, which contains interspersed chorales, sung as arias by one voice with violin accompaniment, and by =Reinhard Keiser= (1674-1739).

=Use of the Chorale=.—A step in advance was taken when German composers began to use the chorale of the German Protestant Church as the subject for contrapuntal elaboration, a tendency shown in the work of Sebastiani referred to in the preceding paragraph. The Chorale had absorbed into itself the spirit of the Volkslied, and its use supplied the medium for the public to enter fully into the spirit of the oratorio. Two composers who developed the "Passion Music" idea to its height, =Karl Heinrich Graun= (1701-1759) and =Johann Sebastian Bach=, made the Chorale an integral part of their works. The greatest work in oratorio form written by Graun was called _Der Tod Jesu_ (The Death of Jesus), which was first produced in the Cathedral at Berlin in 1755. This work consists of recitatives, airs and choruses, the fugal treatment of the latter being admirable in point of clearness of design and breadth of form. Graun used in this oratorio six chorales. _Der Tod Jesu_, owing to a bequest, is still given in Berlin.

=Bach=.—The greatest of all the settings of the Passion are those by =Johann Sebastian Bach= (1685-1750). The first work in this style by Bach was the one according to "St. John," in 1723, first performed on Good Friday, 1724, at Leipzig. This work, fine as it is, must yield to the second setting, according to "St. Matthew," first produced on Good Friday, 1729, afterward revised and given again in 1740. A few notes on the "Passion according to St. Matthew" will serve for both works. The characters introduced are Jesus, Judas, Peter, Pilate, the Apostles and the People. Certain reflections on the narrative are interpreted by a chorus. The text which furnishes the narrative is assigned to the principal tenor. Fifteen chorales of the Lutheran Church are introduced, and in the singing of these the general congregation was expected to join. The choruses contain powerful and dramatic vocal effects, and though not strictly fugal are intricate in their part-writing. A double chorus is used, each chorus having a separate orchestra and organ accompaniment. The performance of this work (St. Matthew Passion) was restricted to Leipzig in the 18th century, and was discontinued altogether in the 19th until Mendelssohn revived it in 1829. It is given very frequently at the present day during the Lenten season, in part or in full. The "Christmas Oratorio" (1734) is really a series of cantatas for each of the first days of the Christmas week, and contains no new ideas so far as form is concerned.

=Stabat Mater=.—In connection with the "Passion" reference should be made to the Latin hymn, "Stabat Mater," which has been made the subject of treatment in oratorio form, by =Palestrina=, =Giovanni Battista Pergolesi= (1710-1736) for soprano and contralto accompanied by strings and organ, =Emanuele d'Astorga= (1681-1736) for four voices with instrumental accompaniment, the more modern work, in large form, by =Gioacchino Rossini= (1792-1868), most beautiful as music if partaking too much, as critics say, of the sensuous, and the magnificent setting of =Antonin Dvo■ák= (1841-1904). This work has been placed, by musicians and the public, in the category of the world's masterpieces of choral writing.

=George Friedrich Handel= (1685-1759).—We now come to Bach's contemporary, the greatest name in the history of the Oratorio, to the composer who brought to his work a musical learning equal to that of Bach, German earnestness and mastery of contrapuntal science, tempered by knowledge of and experience in Italian vocal methods, producing simple, clear melody

supported by rich, firm harmonies, a complete mastery of the orchestra of the day, a clear understanding of the value of the chorus in working out dramatic effects; and this combination was offered a congenial field for labor in England, one of the great Protestant countries of Europe, with a deep reverence for religion and for the narratives of the Bible and the truths and lessons they enforce. This latter point is strikingly present in the texts of Handel's oratorios; the symbolic meaning of the narrative is clearly indicated and made the central thought of the work, producing a remarkable effect of Unity. As a writer has said: "Handel preaches through the voices of his chorus." The orchestra for which Handel wrote was smaller than the full orchestra to which we are accustomed today. The proportion of string players to the whole number of players was smaller, but on the other side, more than two oboes and bassoons were used; flutes were most frequently used as solo instruments or to double the part of the oboes; the clarinet Handel never used, doubtless because of its imperfections, which were not remedied until later; the brass instruments used were trumpets with kettle drums for their natural bass, horns and the three trombones, alto, tenor and bass; other instruments of a soft-voiced quality, like the harp, viola da gamba, were occasionally used for obligato accompaniments. The organ was always used, the part being written according to the figured bass system, and the harpsichord was used by the conductor. The reader who is able to analyze one of Handel's oratorio scores will be surprised to note the superb effects he makes with comparatively small resources. Compared with the polyphonic writing of his predecessors and his great contemporary, Bach, his fugues seem light and simple, but that very thing gives them their admirable clearness and purity; compared with later works, his diatonic progressions and harmonies based on common chords seem colorless, especially so in contrast with the kaleidoscopic chromatic figures and strongly dissonant harmonies of the newer school; yet in this point is the strength of Handel's works with the public; simplicity is valued more highly than complexity, naturalness rather than the indications of science.

Handel wrote seventeen works that can be classed as oratorios. The first of these was "Esther," in 1720, revised and brought out anew in 1732. In 1733 "Deborah," perhaps best-known for a powerful double chorus, was offered to the public; "Athaliah" in the same year. In 1739 came "Saul" and "Israel in Egypt," the former best-known today for its famous "Dead March," the latter for the music descriptive of the plagues. In 1741, he wrote his greatest oratorio "The Messiah," which was first performed publicly, April 13, 1742, in Dublin. In this we find a certain reflective character which recalls the Passion music of the German school. The only other oratorio which is still given in anything like entirety is "Judas Maccabæus" (1747); other works from which certain portions are still in use are "Samson" (1743), "Solomon" (1749), "Theodora" (1750), a work which Handel considered his best, and "Jephtha" (1752). Great as was Handel's fame in England, the character of his works and the forms he used made little or no impression upon German and Italian composers. =Johann Adolph Hasse= (1699-1783), =Niccolo Porpora= (1686-1767), =Antonio Sacchini= (1734-1786), =Giovanni Paisiello= (1741-1816), =Niccolo Jommelli= (1714-1774) and =Pietro Guglielmi= (1727-1804) wrote in the Italian style, and their works are, properly speaking, concert oratorios, scarcely distinguishable from the opera save by the text.

=Franz Joseph Haydn=.—The next name of importance is that of Haydn (1732-1809), who wrote "The Creation" and "The Seasons" toward the end of a long life, after his work as a composer had given him a command of musical resources excelled only by Beethoven, who did not equal him in skill in writing effectively and suitably for voices. It was in 1798 that "The Creation" was first given in Vienna. The score abounds in effective writing for the solo voices, in the florid style and in the conventional aria form, and in brilliant choruses which, however, cannot compare in dignity and breadth with those of Handel. The orchestral accompaniments are much more elaborate than those used by Handel, as can naturally be expected from a composer who had given his greatest efforts to the development of instrumental music. "The Seasons" was first performed in Vienna in 1801. It proved as successful as "The Creation." Haydn's simple, genial nature is apparent in this beautiful work, really too light to bear the name of oratorio, which has such close association with works of a deep, religious character.

=Mozart and Beethoven=.—As the orchestra developed under the masters of tone and dramatic effects, Mozart, Gluck and Beethoven, so the works in oratorio form took on a different texture. In the earlier periods, the accompaniments were subordinate, the interest was centred in the voices. But as composers realized the possibilities of the constantly-improving orchestra and the opportunities for effective combinations of voices and instruments, the tendency became more and more marked to elaborate the instrumental parts and to create an ensemble more complicated and gorgeous, based upon the orchestra and its tone-color scheme rather than on pure vocal effects. =Mozart's= "Requiem" (1791), written just before the composer's death, brings into use the most powerful dramatic resources of orchestra and voices to portray the spirit of the "mass for the dead." In oratorio, as in opera, =Beethoven= wrote but one work, "The Mount of Olives" (1803). The style is florid and operatic, somewhat in the style of the Italian composers; the resources of the orchestra are drawn upon more extensively than marked the methods of Haydn. The chorus is freely used, the "Hallelujah" being the strongest movement. The choral movements in the Ninth Symphony suggest what Beethoven might have done had he set himself to writing an oratorio in greater submission to the capacity of the human voice.

=Spohr=.—From now on, oratorio composition is associated with the masters of instrumental music, the orchestra is drawn upon for its richest and most powerful resources to work out the emotional and dramatic qualities of the texts; it is now no longer a mere accompanying instrument; it is in the highest degree essential to the effects designed by the composer. =Ludwig Spohr= (1784-1859), a great violinist, wrote his first oratorio, "_Das Jüngste Gericht_" (The Last Judgment), when he was but twenty-eight years old. A later work produced in 1826, goes by the English name "The Last Judgment," although that is not the literal translation of the German title _Die Letzten Dinge_. In this work we find the romantic idea clearly in evidence. The composer's style had been developed and individualized by his long experience as player and conductor; he was a master of the resources of instrumentation, conversant both as composer and conductor with the limitations of voices—he wrote a number of operas—so that he was prepared for the creation of a work which has a character of its own. A striking feature of this oratorio is the frequent use of chromatic progressions, which is indeed a characteristic of Spohr's writing.

=Mendelssohn=.—The next great composer in Oratorio was a German; like him also his works had their greatest reception in England, =Felix Mendelssohn Bartholdy= (1809-1847). His first work, "St. Paul," was given at Düsseldorf in 1836. His greatest oratorio, one that ranks with Handel's "Messiah" in public favor, is "Elijah," which was written for the Birmingham, England, Festival. It was first produced in 1846. As a diligent and enthusiastic student of Bach, it seems natural that Mendelssohn should have adopted the great master's methods. In style "St. Paul" and "Elijah" show leanings toward Bach and the German oratorio rather than toward Handel. Mendelssohn, who produced Bach's "Passion according to St. Matthew" in Berlin, in 1827, was thoroughly familiar with the plan of the German oratorio, a mingling of narrative, dramatic and meditative or reflective elements, and especially the Chorale to represent the Church, the chorus being, properly speaking, a part of the _dramatis personæ_, representing masses of people who share in the action, while the congregation represents the reflective element. He uses a fugal style quite freely in his choruses, but a strict fugue, in the style of Handel, is rare, as the composer's feeling for emotional effects demands a freer style; the accompaniments are elaborate, partaking of the dramatic element and drawing upon the fullest resources of the orchestra. Mendelssohn had started the composition of another oratorio, "Christus," on the lines of the "Passion" music of Bach, but died before the work was completed. His "Hymn of Praise" (1840), a large choral work that is occasionally sung, well represents Mendelssohn's skill in combining vocal and orchestral effect. Riemann calls it a symphony-cantata, Parry says it "combines the qualities of a symphony and of an oratorio."

QUESTIONS AND SUGGESTIONS.

Give the names of the Italian composers who followed Carissimi in the Oratorio.

What contributed to make Germany a congenial field for Oratorio?

Who are the early composers of the "Passion" music?

Give an account of Bach's work in Oratorio.

Give the names of the leading composers of the "Stabat Mater."

Describe Handel's orchestra.

Mention Handel's most important works in Oratorio form.

Give an account of Haydn's work in Oratorio.

What works did Mozart and Beethoven write in Oratorio form?

Describe Spohr's work in Oratorio.

Where did Mendelssohn's work become most popular? Give an account of his compositions in Oratorio form.

The class should, if the works are at hand, read through the text of Bach's, Handel's, Haydn's, Spohr's and Mendelssohn's oratorios, all or as many as can be secured. Each pupil may be asked to write an account of one work.

SUGGESTIONS FOR A REVIEW OF LESSONS XVII TO XXIV.

The teacher or a pupil should study the subject of the Renaissance in a history of literature and also of art, and then present to the class an abstract of the study, to show the spirit of the movement and its influence on art, especially music.

Use the paragraph heads in each chapter with the important sentences in the paragraphs to make an outline of each lesson. This is a great help in fixing the lessons in the mind in preparing for examination.

Sum up Monteverde and his work, his relations to predecessors and successors.

Why did the centre shift from Florence to Venice?

Give a sketch of Scarlatti, his life and contributions to music.

If time will permit, some pupil should prepare a short account of such composers as Pergolesi, Porpora, Piccini and Paisiello.

Give a summary of the development of the art of Singing.

A pupil should consult Grove's "Dictionary" and make a paper on the great singers of the olden times, their personality; also interesting anecdotes.

Compare the Italian Opera with the form developed by Lully and Rameau.

In what respects did the English Opera differ from the Italian and French form?

State the characteristics of the German Opera.

Handel's work in Opera, especially in England, will make an interesting study for a short paper to be read before the class by some member of it.

Gluck's career is full of interest and incident and his growth is clearly a matter of experience. A pupil can, to advantage, study his life in some biography or in Grove's Dictionary and present an abstract to the class.

In what respects did Mozart's and Beethoven's operas show differences from the conventional Italian form?

A study of Rossini's life and works is full of interest, on account of his strong personality and striking characteristics.

What is "Passion Music"? Why is it specially suited to the German Protestant Church?

Compare Handel's, Haydn's, Spohr's and Mendelssohn's work in Oratorio.

Excellent results will be obtained by having pupils prepare charts which are filled up from lesson to lesson. Take a large sheet of paper, divide it into columns, each column into quarter sections, each column representing a century, each section, twenty-five years. Add dates of birth and death of the great musicians, marking each name I, F, G, to show nationality (Italian, French, German, etc.). Another chart should show the various national schools, France, Germany, Italy, etc., by centuries and quarter centuries; another the development of such phases as opera, oratorio, singing, sonata, etc.

A very valuable chart is one showing contemporaries, in musical and general history, also parallel events, for example, the musicians who lived in a certain century, famous kings, statesmen, explorers, poets, scientists, discoveries (such as America, printing, etc.), famous battles, events in Biblical and American history, and other political events of the same century. Credit should be given in class standing for these charts.

LESSON XXV.

THE EVOLUTION OF THE PIANOFORTE.

While the violin, on account of the simplicity of its construction, arrived early at a stage of perfection, the complicated mechanism of the pianoforte required many generations and many scores of more or less successful experiments to attain anything like a corresponding plane. Indeed, such experiments are still constantly in progress; so that the pianoforte of the future may conceivably realize possibilities as far ahead of the present piano as that is ahead of its predecessors. The first attempts at piano manufacture,

however, had little in common with our modern pianos, save the principle of the combination of the keyboard with strings; since in construction and resulting tone few points of similarity exist.

=Clavier a Substitute for the Organ=.—We are probably indebted to the extensive use of the organ for the earliest combinations of keys and strings. As the demand arose for a more conveniently-keyed instrument than the large church organs, for practice or private houses, small portable organs were invented; yet even these did not satisfy the want entirely, owing to the _difficulties in their wind supply_, which required an assistant as blower. Thus the organ keyboard came to be applied, as early as the 11th century, to already existing stringed instruments which were adapted to the purpose.

=Two Classes=.—There were two classes of these, each made on the principle of the zither: namely, by stretching strings over a flat surface or box, generally across bridges, this box serving as a resonator, to reinforce the weak tone of the strings. One such instrument, in which the strings were _struck by_ little wooden _hammers_, was called the Dulcimer; another, in which the strings were sounded by _plucking_ with the fingers or by a quill, was called the Psaltery; and from these two were developed the earliest instruments of the piano class, called by the general name of “Claviers,” from _Clavis_, a key. The dulcimer type resulted in the =Clavichord=; the psaltery type in the =Harpsichord=, and, although many other names were given to varieties of these instruments, all may be placed in one of the two classes of which they are the chief representatives.

[Illustration: CYMBALUM OR DULCIMER.]

[Illustration: PSALTERY.

This instrument also came in square and other forms; strings varied from 6 to 38.]

=Principle of the Clavichord=.—The first of the Clavichord instruments had the name of Monochord, or one-stringed instrument—a name of great antiquity, first given by the Grecian Pythagoras to an instrument of one string used by him in determining the relations of tones. Similar experiments were made in the Middle Ages, in which the various tones resulting from the vibrations of parts of a string were studied by means of movable bridges; facility was gained by increasing the number of strings to four or five, tuned in unison. Next, _keys_ were applied to these in place of the bridges, which keys _struck the strings at various_ definite _points_ by means of upright pins or _tangents_, as they were called, producing varying pitches, according to the length of the part of the string allowed to sound, the remaining segment being silenced by a piece of cloth. Thus several tangents struck the same string at different points, producing different degrees of pitch. At first, when only the scales corresponding to the white keys were employed, four or five strings sufficed to sound the necessary tones, not over twenty-two in number. Later, however, when chromatic notes were adopted, the number of strings and keys was increased, so that, by the beginning of the 16th century, the keyboard had a range of three or four full octaves. From this time on, this instrument, now generally known as the Clavichord, won a popularity which extended to the beginning of the 19th century, when the Pianoforte gradually displaced it. A familiar instrument in England and Germany, it was especially cultivated by musicians of note in the latter country, even the renowned Bach preferring it to all other forms of its class.

=The Clavichord=.—In shape, the Clavichord was an oblong box, the strings of brass extending lengthwise. The fact that one string served for several keys made it impossible to sound certain intervals together; yet the device of giving a separate string to each key seems not to have come in till about the year 1725, and even then not to have been generally adopted. Without legs, the Clavichord was supported on a table when in use. Its tone was exceedingly weak and tremulous, audible only within the distance of a few feet; yet the fact that this tone could be given different degrees of intensity, and could be varied to some extent even while sounding, by a peculiar pressure on the keys (_bebung_), imbued its tone with a sympathetic quality which helps to account for the tenacity with which musicians clung to it, notwithstanding all its imperfections.

[Illustration: THE CLAVICHORD.]

=Principle of the Harpsichord=.—Instruments of the Harpsichord class were especially numerous in Italy, France and England. They differed from the Clavichord chiefly in the method of setting the string in vibration. This was done by _plucking_ the string with a quill set in a jack at the end of the key, the action so arranged that, after the key was released, the jack fell back to its place, while a damper came against the string, preventing its further vibration. Since these strings could not be used as bridges, like the tangents of the Clavichord, it was necessary from the first that each key should have a separate string. Moreover, as these strings were thus made of varying lengths and thicknesses, the Harpsichords were more often made in a triangular shape, or one like our modern grand pianos, than in the rectangular Clavichord shape. The chief defect, and the one which makers tried in vain to

remedy, lay in the fact that the _plucking_ of the strings, while producing greater brilliancy, _admitted_ of _no variation_ in its degrees of _loudness_ or _softness_.

=Virginal and Spinet=.—Several small instruments of this kind preceded its full development, differing mainly in shape and choice of materials. In England these received the name of Virginal; in France, that of Spinet. Both of these were introduced into polite society, chiefly as small house instruments of limited compass, varied sizes, and frequently with elaborate decoration. The difference between them was principally one of shape, the Virginal taking the oblong form of the Clavichord, while the Spinet was more often triangular. They appeared both with and without supports; and in some cases the strings were placed in a vertical position, as in our upright pianofortes.

[Illustration: THE VIRGINAL OR SPINET.]

=The Harpsichord=.—The Harpsichord proper was simply a larger form of the Spinet and Virginal, and was made in the form of the grand pianoforte. On account of its added brilliancy of tone, it was admirably adapted for use in the orchestra, in which it became the conductor's instrument in connection with the opera. In Italy, the terms Clavicembalo and Gravicembalo were given to it, while in Germany it was called Flügel, or wing, from its wing-shaped cover. As it became popular as a concert instrument, many inventions were added to increase the brilliancy and variety of its tone: an extra keyboard was placed above the first, as in the organ, and three or four strings were given each note, which could be used to reinforce the single-string tone, by means of the second keyboard. Moreover, various kinds of quills were invented, giving different tone qualities; and such effects were controlled by stops or pedals. These experiments were especially numerous in the 18th century, in which the rapid growth of musical resources demanded constantly more tonal possibilities. Large manufacturers, such as the Ruckers family of Antwerp, and Tabel in England, vied with each other in producing novel devices, such as the imitation of other instruments, the tuning of an extra string for each note an octave above its normal pitch, and the addition of a keyboard connected with an organ. Attempts to produce a sustained tone resulted in the Piano-Violin, in which a revolving rosined wheel was pressed by the key against the string, to continue the tone; but all such were abandoned finally as unsuccessful.

[Illustration: TWO-MANUAL HARPSICHORD.]

=Invention of the Pianoforte=.—To this exceptional activity in keyed instruments, and the final failure to produce a singing tone capable of variation in the Harpsichord, we owe the invention of the Pianoforte. In 1711, =Bartolomeo Cristofori=, a noted harpsichord maker of Tuscany, exhibited several "forte-pianos" in which the action was so constructed that the keys, when depressed, threw little _leather-headed hammers_, affixed to a bar above them, _against the strings_, thus making it possible to modulate the strength of tone by the degree of force with which the keys were struck. When the key was released, a _damper_ came against the string from beneath, _stopping further vibration_.

=Early Makers=.—Although this invention did not at first attract widespread attention, it undoubtedly formed the basis of the others which quickly followed it, and really asserted the principle afterwards adopted for the piano action. In 1716, =Marius=, a French manufacturer, submitted four models for piano actions, which, however, were never developed. Also, =Schroeter=, a German, constructed two models of piano actions, in 1717, in one of which the hammers struck on top of the strings; but neither of these was put to practical use. Finally, =Gottfried Silbermann=, of Saxony, distinguished as an organ and harpsichord maker, made two pianofortes, the action of which was evidently based on that of Cristofori, and which he exhibited to J. S. Bach. While praising them in many respects, Bach criticised them as too weak in the upper notes, and too hard to play. Silbermann was exceedingly painstaking as a workman, having the reputation of breaking to pieces with an axe even a finished product which showed any imperfection. He therefore set to work to remedy these defects, and, in 1737, produced several pianofortes which won Bach's unqualified approval.

=Superiority of the Piano=.—The Pianoforte was now placed upon a firm basis; and although many years elapsed before its resources were developed sufficiently to cause its universal adoption by musicians, the final victory over its predecessors was complete. And this victory was natural, since the Pianoforte was found capable of combining the best qualities of the Clavichord and the Harpsichord, with the addition of a tone capacity infinitely superior to either.

=Improvements=.—The story of succeeding piano manufacture and the manifold inventions and improvements relative to it is one of infinite details. Among these we notice that while Silbermann pianos were in "grand" form, =Frederici= of Gera (died 1779) constructed them in oblong or "square" shape; that the pianos of Spaeth (died 1796) and of =J. Andreas Stein= (died 1792), whose pianos were adopted for use by Mozart, showed considerable advancement. The Stein family became allied with =Andreas

Streicher=, an inventive genius, and founded a manufactory in Vienna which has maintained a high standard to the present time. The action invented by them, known as the Viennese action, differs from that of Cristofori in having the hammers annexed to the keys themselves, instead of on a bar above them; thus giving a light touch and tone. In England, the principle of the Cristofori action was developed by the renowned house of =Broadwood=, their action becoming known as the English action; while in France, =Sebastian Erhard=, or =Erard=, a Strasburg inventor, founded the Erard action, which has a double hammer movement, allowing the hammers to fall either entirely, or only partially into place after the key is struck, at the will of the performer. The “cottage” action, introduced by =William Southwell=, about 1800, was the beginning of the “upright” form, which has now entirely superseded that of the square piano. Thus, by continued experiments, the piano has gained in compass, brilliancy, sustaining power and strength of construction, to meet the constantly-increasing demands placed upon it, until the modern piano seems to possess unlimited resources, and until the unending supply of instruments of all grades from hundreds of factories is sufficient to place one of these “household orchestras” within the reach of rich and poor alike.

=Equal Temperament=.—An early difficulty in the case of keyed instruments was the matter of tuning, caused by the fact that it was found scientifically impossible to tune all the intervals of the scale at the same time to the true pitch; that is, the pitch demanded by the natural overtones of the fundamental note of the scale. At the outset, for instance, it was found that if the fifths were tuned true, the octaves would be a trifle sharp; and, conversely, if the octaves were true, the fifths would be a trifle flat. In the case of stringed instruments, where the tone was made by the performer, it could be so modified as not to conflict seriously; but with keyed instruments this was impossible. Thus, many systems of tuning or “temperaments” were tried, such as having two keys for two notes nearly in unison, like F-sharp and G-flat, most of these resulting in the possibility of playing in a few nearly related keys, to the exclusion of the others. Finally, through the influence of =J. S. Bach= (1685-1750) and the Frenchman =Rameau= (1683-1764), the simple expedient was definitely adopted of tuning the octaves true, and dividing each octave into twelve equal parts, thus uniting such notes as F-sharp and G-flat in one tone slightly out of tune with either, but not enough seriously to offend the ear. This, called “_equal temperament_,” was a great gain to music, since it not only removed a radical defect in keyed instruments, but also opened the door to that free interchange of keys which has done so much toward enriching the coloring and scope of succeeding compositions.

QUESTIONS.

What principle did the first attempts at piano-making recognize?

To what circumstance are we indebted for the attempt to make an instrument of the Clavier type?

What are the two classes of stringed instruments with keyboard as known in the 11th century?

State the steps in the development of the Clavichord principle.

Describe the Clavichord.

Describe the Harpsichord principle.

Describe the Virginal and Spinet.

Describe the Harpsichord.

Who was the inventor of the Pianoforte? When did he exhibit the first instrument?

Who were the early makers?

What points of superiority did the Piano have over the Clavichord and the Harpsichord?

What successive improvements were made by various makers?

What is meant by Equal Temperament?

LESSON XXVI.

THE EARLY ITALIAN CLAVIER COMPOSERS.

=Early Instrumental Music=.—The history of pianoforte composition and playing really begins with that of the preceding keyed instruments with strings, to all of which the convenient name of “Claviers” will be given. As these early instruments were at first merely substitutes for the organ, which in turn was used simply to reduplicate voice parts, the music first played on them was in no wise different from the vocal and organ music of the day. When, moreover, music written for the organ had some features distinct from purely vocal music, it was frequently inscribed to be _played on the organ or clavier_, without discrimination.

=Influence of the Renaissance=.—As most of the patterns of musical form have proceeded from Italy, so it was there, in Venice, that instrumental music seems to have emerged from its union with vocal music, and to have assumed the elements of a style of its own. This was directly the result of the general awakening of thought after the Dark Ages, known as the Renaissance, which, leading to independent investigation in the domains of science and art, brought in the once unheard-of inventions and the discovery of new worlds, and in the other a freedom of treatment fitted to express the new ideas surging throughout the civilized world. Thus, in the first part of the 16th century, while Raphael and Michael Angelo were voicing these thoughts in their immortal creations, in Venice, a school of musicians was turning its attention toward instrumental music, and striving to produce in music a richness of color, just as the great Venetian painters, like Titian and Giorgione, were producing similar effects upon canvas. Teachers and students were congregating there, enthusiastic over the new ideas in music; and the focal point of all this activity was the Church of St. Mark’s, whose magnificent double organ furnished an incentive to genius.

=The First Sonata=.—Among these musicians were a number of apostles of the Netherlands school, of whom =Adrian Willaert= (1480-1562) was especially honored and beloved. He and his successors, as organists at St. Mark’s, wrote compositions for organ or clavier, which they taught to young ladies in the convents. Such compositions were made the more possible by the fact that into the old Church Modes, formed by using only the tones represented by the white keys of our piano, “chromatic” or _colored_ tones came to be inserted; so that, in the course of the 16th century, the modern scales, with their characteristic keynotes, or tonalities, came to vie with the old modes, and ultimately nearly to displace them, thus giving a chance for a variety and grouping of harmonies necessary in the elaboration of instrumental music. The name Sonata, or “sound” piece, was at first given indiscriminately to such instrumental works, in distinction from the Cantata, or vocal work.

=Willaert and His Pupils=.—Willaert was especially successful as a teacher, and thus left a number of accomplished pupils to carry on his labors. Of these, =Girolamo Parabosco= (1593-1609) was noted for his free fantasias, and his improvisations of sonatas on the harpsichord; while =Claudio Merulo= of Correggio (1533-1604) wrote a number of toccatas, in which the old church chorale style was relieved by contrasting passages consisting of brilliant runs. The Toccata, or _touch_ piece, had, as its characteristics, such _quick running passages_, probably first suggested by the light tone and action of the Clavier. While these runs had at first very little relevancy to one another, they were much delighted in by these early pioneers, who sported with them as a child plays with a new toy.

=The Gabrieli’s=.—Two other organists of St. Mark’s, =Andreas Gabrieli= (1510-1586), and his nephew and pupil, =Giovanni Gabrieli= (1557-1613), added to the resources of instrumental music. The first of these, a pupil of Willaert, himself became a famous teacher; and both contributed many canzone and sonatas to organ and clavier literature. In all these the subjects were distinct, and, in the canzone especially, the many quick passages and changing rhythms were used in a manner that contributed to unity.

=The Harpsichord in Opera=.—A new factor now appeared in Florence, destined greatly to further the cause of clavier music: namely, the Opera. Taking the position of the conductor’s instrument, the harpsichord became the most useful member of the orchestra, and was employed constantly to fill in vague harmonies, and to strike chords as a support to the musical declamation of the singers. Such chords were not generally written out, but were suggested by their bass note, over which figures were written to

show their positions. To this shorthand system the name of Thorough-bass was given. In this way the value of chord combinations came to be recognized, and the relationships of such chords studied entirely apart from the voice writing; so the idea of a single melody, supported by occasional chords, was transplanted from the Opera, and the modern harmonic style of music came into being.

=Dance Tunes=.—But, in this new style, the old basis for Unity in the composition, furnished by the imitation of one part by another, had to be abandoned, since only one melodic part existed at a time; hence a new _basis_ had to be found in the manner in which _harmonies succeeded_ each other. In determining such chord relationships, composers were obliged to look elsewhere than to the old Church music; and so turned their attention to the forms of Dance Tunes which had already been in use for a long time among the people in their Folk-songs, and in the performances of the wandering minstrels. Most of these dance tunes were formed in a very simple _two-part_ design of harmony, consisting in a transition from the initial key to a contrasting key, for the first part, and a return from the contrasting key to the first key, in the second part.

=Origin of the Suite=.—A book of such dances, based, however, on the clumsy church modes, was published in 1551. Later, however, such dances came to be written in the new harmonic style; and by putting together a set of dances all in the same key but differing in rhythm and mode of expression, a larger form of composition was devised, combining Variety with Unity. To this form the name of Suite was given.

[Illustration: GIROLAMO FRESCOBALDI.]

=Frescobaldi=.—Another element tending to give Unity to the composition was developed when composers learned to work out a _single subject_, or melodic phrase representing a definite musical idea, by introducing it a number of times in the course of the composition, sometimes with slight variation, but always recognizable and used in such a way as to bind the various parts the more closely together by their similarity of conception. Several organists at Rome wrote music which possessed such unity of idea. One of these was =Girolamo Frescobaldi= (1583-1644), a man who was a close student of the best Italian music of his time, and who had, moreover, been brought into contact with Netherlands ideas through travel in Belgium. On his first appearance as organist of St. Peter’s in Rome, in 1615, so great fame had preceded him that over 30,000 people are said to have attended the performance. His skill on the clavier was no less than that on the organ; and for both of these instruments he wrote Ricercari, Canzone and Capricci, which showed considerable unity of subject, together with fluency in the treatment of chromatic progressions, and a wealth of invention, which displayed itself in novel themes and unusual harmonies; his compositions are well worth study.

=Pasquini=.—In the second half of the 17th century, =Bernardo Pasquini= (1637-1710), a pupil of the opera composer Cesti, carried on the work at Rome. In his toccati he shows great freedom in departing from the strict vocal style, and his clavier works have features, like the sustained trill, which distinguish them decidedly from organ works.

=Method of Playing the Clavier=.—The method of playing the clavier used by these old masters was peculiar. In a work on the subject published by Di Ruta, about the year 1600, the rules given include holding the fingers out _flat_ on the keys, and scarcely using the thumb at all, allowing it to hang below the level of the keyboard. The scales were played each with _two_ fingers, according to fixed rules; so that smoothness combined with rapidity seems to have been made impossible.

=The Sonata and Overture=.—Starting with the harmonic form of the old dance tunes, composers now began to elaborate this to a form capable of expressing more serious ideas, by giving more definiteness to the musical subject treated, and by introducing material derived from the old vocal forms. =Corelli=, the violinist (1653-1713), and the violinists of his school, restricted the name Sonata to combinations of such movements, in distinction from the lighter forms of the Suite; and the celebrated opera composer, =Alessandro Scarlatti= (1659-1725), applied similar methods to the composition of his operatic overtures, writing them in three parts: first, a moderately fast movement, which was followed by a slow movement, the whole closing with a movement in quick tempo.

=Domenico Scarlatti=.—Clavier music lagged somewhat behind violin music, owing to the greater perfection of the violin as an instrument, and also to the popularity of the lute, which was much affected in fashionable circles. Finally, however, a man appeared who possessed the genius to develop the peculiar resources of the harpsichord to a remarkable extent. This was =Domenico Scarlatti=, the son and pupil of Alessandro Scarlatti. The latter was himself a skilful clavier player and composer; but his son attained a proficiency so far eclipsing that of any of his predecessors as to place him entirely without the pale of comparison with any of them. Domenico Scarlatti, who was born at Naples in 1683, two years before Handel and Bach, first attracted attention when about twenty-one years old, as an opera composer; but achieved his greatest successes as a virtuoso on the harpsichord, winning

a world-wide reputation for his wonderful playing, which was a revelation of what could be done with this hitherto undeveloped instrument. In one of Handel's Italian journeys a contest of skill was instituted between these two musical giants; and the result was a drawn battle so far as the harpsichord was concerned, although Handel triumphed at the organ. Scarlatti traveled about somewhat, spending most of his later life in the position of court music master at Madrid. He finally returned to his birthplace, where he died in 1757.

=Scarlatti's Use of Form=.—In the matter of form, Scarlatti developed still further the work of his predecessors, applying to the harpsichord the principles asserted by Corelli and his school. His Sonatas were written in _one movement_ only, and have very _definite subjects_, which are carried out along recognized lines. His Capriccii—short pieces written in a rhythmic and delicately staccato style—are some of his best works, and undoubtedly paved the way for the Scherzi, written by Beethoven and Mendelssohn. His compositions are short, but concise and definite.

=Scarlatti's Style of Playing=.—But his chief addition to musical material lies in the new style of playing which he invented. Novel effects, like crossing the hands, long leaps, broken chords in contrary motion, rapidly repeated notes, and runs in thirds and sixths—effects which were in many cases far ahead of his time, since they were not used by succeeding composers until a much later period—were employed by him with the utmost fluency, so that he has been aptly called the father of modern pianoforte technic.

[Music: EXAMPLES OF SCARLATTI'S STYLE.]

=Durante=.—The Neapolitan school boasted several other worthy clavier composers, who contributed in various ways to the composition of the Sonata. One of these was =Francesco Durante= (1684-1755), who wrote sonatas in two movements of different character but in the same key. The first, called a Studio, was written as a free fugue with running passages; the second, or Divertimento, was more animated and less scholastic. =Domenico Alberti= (1707-1740) composed sonatas similar in general form, but of less artistic worth, consisting as they did simply of a single-voiced melody, supported by an harmonic accompaniment having no independence of style. Much of this was in the form of broken chords, a mannerism which was afterwards used to excess, and became dubbed the "Alberti bass." This accompaniment form doubtless suited the clavichord and harpsichord, but is not so well adapted to the more sonorous modern piano. It is still used by composers for very simple accompaniments.

[Music]

=Pier Domenico Paradies= (1710-1792) deserves special mention as the writer of elegant and well-balanced clavier music. He first won success as a composer of operas, which were given in Italy, and afterwards in London, where he finally settled as clavier teacher. His sonatas have two movements, like Durante's, and contain brilliant allegros, besides attractive melodies. His two-part rapid contrapuntal work is excellent, both for musical merit and for technical study.

=Summary=.—We have seen, then, that in the 16th century, in Italy, instrumental music began to break from its union with vocal music; that the Opera brought the harpsichord especially into notice in the 17th century, on account of its availability for accompaniments, and that finally, in the 18th century, the Neapolitan composers developed for it a style which took advantage of its peculiar resources, and applied them to the enrichment of the harmonic forms which were coming into vogue.

QUESTIONS.

What influence did the Renaissance have on early instrumental music?

Give an account of the “sonatas” written by Willaert.

What other kinds of composition were written during this period?

What were the contributions of the Gabrieli’s?

How did the Opera influence harpsichord music?

What principles were used in making dance tunes?

What was the origin of the Suite?

How did these early composers attempt to give Unity to a composition?

Tell about the work of Frescobaldi and Pasquini.

What peculiarities of fingering were used by the early players?

What distinction did Corelli and his successors make between the Sonata and the Suite?

Describe the career of Domenico Scarlatti.

What forms did he use in his compositions?

What characteristics did he show in his playing?

Tell about the work of Durante, Alberti and Paradies.

Give the successive stages of development from the 16th to the 18th century.

LESSON XXVII.

THE EARLY ENGLISH AND FRENCH CLAVIER SCHOOLS.

=English Schools to Henry VIII=.—Popular music, both vocal and instrumental, was an early English institution. The many Folk-songs which have come down from a very early period bear witness to the English love of conviviality. Dance tunes, sometimes based on these Folk-songs, were played on the instruments of the minstrels, which, as early as 1484, included the clavichord; and the fact that such instruments were cultivated by people of higher rank is shown by the record that James IV of Scotland and his queen purchased clavichords to play upon, in 1503, while the queen of Henry VII of England bought a clavichord for her private use in 1502. The virginal is spoken of in the reign of Henry VII; Henry VIII (reigned 1509-1547), who was an accomplished musician, played upon both these instruments, and also wrote music for them.

=To Queen Elizabeth’s Time=.—Edward VI (r. 1547-1553) had three duly appointed virginal players among his court musicians; and after Elizabeth (r. 1558-1603) ascended the throne, the virginal increased in popularity; indeed, its name was formerly thought to have been derived from her as the virgin queen; although the fact that the instrument was spoken of as the virginal before her reign makes its derivation from its popularity among young ladies the more probable. Queen Elizabeth, as well as her sister Mary, received instruction in virginal playing during her early youth, and became an accomplished performer; and instances are shown of the former’s great pride in this accomplishment. In the course of her illustrious reign, when all the arts flourished to a remarkable degree, and when great wits and litterateurs vied with each other in the genius of their productions, the art of music received its

share of attention also. The fact that musical degrees were early given at the great universities, Oxford and Cambridge, tended to raise the standard of musical knowledge, and to produce a number of composers who were especially gifted in the more serious Church forms of writing. Many such, connected with the Royal Chapel and the court, wrote excellent anthems and secular part-songs; and now, attracted by the popularity of the instrument, they began to give a more worthy setting to the folk and dance tunes played on the clavier.

=Dance Tunes=.—A clavier composition is extant, dated 1555, by =William Blitheman=, an English church composer, consisting of a chorale-like melody in whole notes, accompanied first by a flowing eighth-note figure, and next by triplet quarter notes, with a third voice added later. Such a serious style prefigured the variations upon dance tunes, which were especially cultivated by =William Byrd= (1538-1623). In such variations the melody was first harmonized in simple fashion, and was afterwards played several times in the same part, with slight changes, while the accompanying parts were varied in rhythm and style, becoming generally quicker in tempo. To modern ears the result is monotonous, as the same key and time signature is maintained throughout; but the variety in presentation must have been grateful after the simplicity of the dance tunes.

=The Virginal Book=.—Other popular forms were the Fancie, in which several melodic subjects were imitated in the various voices; and the Pavane, a dance in common time, whose theme was repeated in the following Galliarde, a dance in triple time. These and other forms are used in a curious collection of clavier pieces now preserved at Cambridge, and known as Queen Elizabeth's Virginal Book. This collection, consisting of four hundred and eighteen manuscript pages, written on a six-lined staff, contains seventy compositions by Byrd, besides others by most of the composers of the Elizabethan era, like Tallis, Dr. Bull, Giles, Farnaby and many others.

=Leading Elizabethan Composers=.—Byrd was a pupil of =Thomas Tallis= (d. 1585), the renowned church composer, and together they were made organists of Queen Elizabeth's Chapel, in 1575, receiving also the sole right to print music. Another musician who deserves special mention is =Dr. John Bull= (1563-1628), who won world-wide fame as organist and clavier player, finally becoming organist at Antwerp Cathedral, which post he held until his death. His clavier compositions show great technical fluency. =Orlando Gibbons= (1583-1625), a Doctor of Music at Oxford, and organist at Westminster Abbey, wrote excellently in the prevailing style. Shakespeare testifies to the popularity of clavier playing at this time in one of his sonnets, where he speaks of the keys as

"O'er whom thy fingers walk with gentle gait."

Although these early English composers wrote with musical solidity, their compositions can scarcely be said to have added much to the development of the instrumental style, or to clavier technic; and, in fact, they amounted to little more than a side issue in music, withdrawn from the general advancement, and valuable chiefly as curiosities. The melodies were apt to be wearisome, through monotonous repetitions, the rhythms to lack variety, and the modulations to appear chiefly in the form of unsuccessful attempts.

=The Parthenia=.—During the first half of the 17th century the virginal retained its popularity, although political turmoils prevented much positive advancement in music. The "Parthenia," a volume containing the first printed collection of virginal music, appeared in 1611, composed of twenty-one pieces by Byrd, Bull and Gibbons; and a similar volume followed, with compositions for virginal and bass viol, by Robert Hole.

=Purcell=.—In the reign of Charles II (1660-1685) music again came to the fore, and was ably promoted by =Henry Purcell=, who was born in the year when Cromwell died, 1658, and died in 1695. Purcell is a shining figure in English musical history, through his ability as an opera composer, in which capacity he produced bright and pithy works, thoroughly English in spirit, and healthy in tone. He published a volume of twelve clavier sonatas in 1683, with parts also for two violins and a bass viol, founded on the model of the Italian violin sonatas, each having an Adagio, a Canzona, a slow movement and an Air. Later he published other sonatas, besides suites and separate pieces for the clavier. Upon the advent of Handel, however, the English composers became, for the most part, mere imitators of his style, which had so caught the national ear as to well-nigh eclipse all other kinds of music. The early English school, therefore, can be said to have had its last exponent in the person of Purcell.

=Rise of the French School=.—In France a school of clavier compositions developed during the brilliant reign of Louis XIV (1643-1715), which did much toward imparting elegance and polish, besides characteristic rhythms and technical figures, to clavier music. The head of this school and the personal teacher of many succeeding clavier composers and players was =Andre Champion de Chambonnières= (d. 1670), who became court clavier player to the king. He is said to have been master of a full tone on the harpsichord attained by none other than himself; he also published two books of clavier compositions, written in the pure

harmonic style, and showing the tendency toward brilliant embellishments which became a characteristic of his successors. Of his pupils, =Jean Henry d'Anglebert= (d. 1691), was clavier player at court, and published in 1689 a book containing clavier arrangements of airs and dances from the operas of Lully, with rules for their execution.

=The Couperin Family=.—Two, at least, of the famous musical family of Couperin also came under the instruction of Champion. These were =Louis Couperin= (1630-1665), and =François Couperin= (1631-1701), who, with their brother =Charles Couperin= (1638-1669), and his son =François Couperin=, called "le Grand" (1668-1733), were all at various times organists of the church of St. Gervais, at Paris. The Couperins may be considered as classic composers for the clavier, as their style, though having an harmonic basis, was mostly in the line of instrumental voice writing. The first-named published three suites of dances for clavier; and the second was eminently popular as a teacher.

=François Couperin=.—François Couperin, "le Grand," deserves special attention, and has been called the _first great composer_ distinctively _for the clavier_. He was a pupil of the organist Thomelin, and rose quickly to so commanding a position as player of the organ and clavier that, in 1701, he was appointed court clavier player and organist at the Royal Chapel. He was very accurate as a composer; and in the four books of clavier pieces which he published successively, he gave minute directions for interpreting the wealth of ornamentation with which his melodies are surrounded. Most of these pieces are _written in two voices_, with the upper melody most prominent; and they reflect the artificial show and glitter of the French court in their endless _turns_ and _embellishments_. Yet for this very reason they have amplified the resources of clavier compositions, preparing the way for composers like Scarlatti, Bach and Handel. Many of them show the French taste toward attaching definite meaning to music, by their fanciful titles, like "La tendre Nanette," "La Flatteuse"—a custom followed by others of this school. Couperin wrote also a treatise on clavier touch, and was _one of the first to make use of the thumb in playing_.

=Louis Marchand= (1669-1732) was a brilliant though dissipated figure in clavier playing. Becoming organist at the court of Versailles, he lost the post through his reckless habits, and, going to Dresden, he was somewhat subdued in his conceit by the evident superiority of Bach. On his return to Paris, he became exceedingly popular as a teacher, although his extravagant style of living brought him finally to poverty. His pupil, =Louis Claude Daquin= (1694-1772), received through him an appointment as organist at the church of St. Paul, in preference to Rameau, of whose superiority Marchand became jealous. Daquin published a number of rather superficial clavier pieces.

[Illustration: JEAN-PHILLIPPE RAMEAU.]

=Jean-Phillippe Rameau=, the last and greatest light of this school, has even greater fame as an opera composer. He was born at Dijon in 1683, and displayed so great musical talent when a mere child that, although his parents had intended him for another profession, he was finally sent to Italy to study music. After spending some time there, he joined the orchestra of an opera troupe, traveling about France and gaining an insight into dramatic composition. Upon going to Paris he studied with Marchand, who recognized and feared his talent, and who finally was the means of his leaving Paris. Later, however, he obtained an organ position outside of Paris, and soon attracted attention not only by his playing, but also by the publication, in 1726, of a treatise on Harmony. In this he _reduced_ the study of _chords_ to a _scientific foundation_, and won his title of the name of creator of the modern science of Harmony. Returning to Paris, he now secured an organ position there, and set to work upon the series of dramatic productions which made him the foremost opera composer of his day, superior even to the popular Lully. In 1737, he published another theoretical work, in which the principles of Equal Temperament, which J. S. Bach had adopted fifteen years before, were so clearly stated as to make their establishment permanent for future composers. Rameau's theories were the subject of much controversy in his day; but many distinguished contemporaries, like Rousseau and Voltaire, were his warm partisans. He died in 1764.

=Rameau's Clavier Works=.—His numerous _clavier compositions_ show great advance in freedom of expression, and are written mostly in _three parts_, with an occasional succession of full chords. Many of these have _descriptive titles_, such as "La Poule," in which the cackling of a hen is cleverly imitated. Others are in the form of dance suites. The order of Prelude, Allemande, Courante, Sarabande, Gigue was made the basis of these suites as well as those of Couperin, although this order admitted of considerable variation; and no other principle of Unity appears in them, with the exception of a _common key_.

=End of the Early French School=.—The growing importance of the German school now came to be felt in France so strongly that the French school came to lose its individuality. We therefore turn our attention to the important developments in instrumental music which were effected in Germany.

QUESTIONS AND SUGGESTIONS.

Tell about early English instrumental music.

Tell about music in Queen Elizabeth's time.

Describe the Variation form used by Byrd.

What was the Virginal Book?

What was the style of the Elizabethan composers?

What was the "Parthenia"?

Give an account of Purcell and his work.

Who was the founder of the French school?

What family figures prominently in the French school?

Who was the greatest member of this family? Tell about his work.

Tell about Marchand and Daquin.

What great theorist is prominent in French clavier music? Tell about his work.

Note that the English school was at its height in the reign of Queen Elizabeth, Purcell, in the reign of Charles II, being the greatest light of the school. The strength of the French school was during the reign of Louis XIV.

LESSON XXVIII.

THE GERMAN POLYPHONIC CLAVIER SCHOOL.

=German Mastery of Polyphonic Music=.—The Italians, with their quick perception of structural beauty, have been the pioneers in the invention and use of most art forms. So it happened, in the history of instrumental music, that they were the ones to invent and give to other nations the vehicle of expression, while it remained for their pupils, notably, in this case, the composers of Germany, to fill these forms out with the expression of real and deep feeling. The German tendency toward serious and philosophical thought found the intricacies of polyphonic music, or the simultaneous flow of independent melodies, admirably adapted to their need of expression; and when this style of voice writing was applied to instrumental compositions, German musicians found a branch of art

in which they were admirably qualified to excel. So, from being mere pupils of the Italians, they advanced to the production of works of much more distinguished character and deeper, richer content than was possible to mere beauty of form and melody.

=Hasler=.—In the second half of the 16th century, the clavier was popular in Germany, disputing the place of the lute as a social instrument, although organ and clavier compositions were identical, as in Italy. There is a record of the publication of two books of pieces for organ and “instrument”—by which is meant the clavier—in 1575-77, in which there were dance tunes with accompanying chords. =Hans Leo Hasler= (1564-1612), a pupil of A. Gabrieli, and fellow-student with G. Gabrieli, was especially prominent as organ and clavier player and composer during this epoch, publishing a number of such dances written for the organ or the clavier.

=Froberger=.—The devastating Thirty Years’ War (1618-48) put an end to artistic ambition during its progress. However, art quickly recovered at its close, and a number of worthy musicians appeared. An interesting figure among them, and a man who has been called the first German clavier virtuoso, was =Johann Jacob Froberger= (1605-1667). Showing great promise as a boy, he was brought to the notice of the Austrian Kaiser, Ferdinand III, who sent him to Rome, where he studied with Frescobaldi for three years. After this we hear of him as a successful performer at Paris, and, on his return to Vienna, as court organist, in which position he won widespread fame. A remarkable story is told of a perilous journey to England, where he arrived penniless, and of his subsequent recognition and his cordial reception by Charles II, who was delighted with his improvisation upon the harpsichord. Afterwards returning to Vienna, he resigned his post there, through some disagreement, and lived afterwards in retirement. In a number of Caprices, Toccatas and the like, written in the contrapuntal style, he definitely adopted the five-lined staff, and introduced many embellishments, after the French fashion. He possessed much charming melodic invention, and, in his Toccatas employed a treatment of his subject in definite sections, which afterwards appeared in the fugue form. Froberger anticipates the _program style_ of music, as he is said to have improvised descriptions of events, like that of the Count von Thurn’s crossing of the Rhine, which he depicted in twenty-six pieces.

=Johann Kaspar Kerl= (1625-90), also sent by Ferdinand III to Rome, studied there with Carissimi, the oratorio writer, becoming accomplished as an extemporizer. He occupied a number of organ positions in Vienna and Munich, also teaching the clavier, and wrote compositions which show a tendency toward the modern scale systems. =Johann Pachelbel= (1653-1706), celebrated as organ and clavier player, wrote pleasing works for the clavier, in which he tried to follow out the characteristics of the instrument. Many of these were in the form of variations. =Georg Muffat= (d. 1704) showed in his compositions a tendency toward French ornamentation, and his son =Gottlieb= (1683-1770), a pupil of the contrapuntist J. J. Fux, was organist to the Kaiser Charles VI, in Vienna, and clavier teacher to the Imperial family. His clavier compositions were in the form of Versettes and Toccatas.

=Eighteenth Century Clavier Composers=.—The Thirty Years’ War exercised a demoralizing influence upon music trades, and many excellent musicians were unable to have their compositions published in consequence. The result is, that comparatively few specimens of the works of the composers mentioned have come down to us in available form. Approaching the 18th century, we now come to a group of composers who represent the most brilliant epoch of early clavier work. Their productions, while retaining the dignity and complexity of the contrapuntal school, yet use its material with a freedom of modulation and of dissonant chords sufficient to express genuine emotional ideas through their medium.

=Reinken and Buxtehude=.—The Hamburg organist =Johann Adam Reinken= (1623-1722), a native of Holland, wrote a number of clavier compositions, publishing in 1704, pieces for two violins and harpsichord. =Dietrich Buxtehude= (1637-1707), organist at St. Mary’s Church, Lübeck, from 1668, excelled in free style of writing for clavier. The latter gave a series of Sunday evening concerts at his church which gained renown through all the surrounding country; and J. S. Bach himself is said to have walked to these concerts, a distance of fifty miles.

=Instrumental Polyphonic Forms=.—These men have been mentioned largely because their work made possible the results which Bach afterwards attained from an elaboration of what they had already accomplished. It was among such eminent German organists that the instrumental Fugue, the highest instrumental type of polyphonic music, took definite shape, consisting of an Exposition, in which the Subject, Answer and Countersubject were announced by the various voices; and a subsequent Development, in which, according to certain laws more or less strict, the material presented was carried through a variety of phases and brought finally to a triumphant close. Of other forms, like the Toccata and Canzona, the tendency came to be toward more freedom of treatment on the one hand, and an increasing definiteness and consistency on the other.

=Handel’s Early Life=.—A composer must now be mentioned whose work lay chiefly in other fields than the clavier, but who nevertheless drew much of his inspiration from the strings of the harpsichord. This was =George Frederick Handel= (1685-1759),

who was born at Halle, and whose musical genius asserted itself so strenuously that, although his father was strongly opposed, he learned the harpsichord as a mere child, and became so proficient a performer that the reigning Duke of Saxe-Weissenfels, hearing him play, insisted on his receiving a thorough musical education. So he was placed under Zachau, a competent organist and musician, at his native place, with whom he studied diligently. After his father's death he went to Hamburg, entering the orchestra of the Opera house and rising to the post of harpsichordist. Launching out as an opera composer, he began to acquire a reputation, and in 1706 went to Italy, meeting many distinguished musicians there, among them Domenico Scarlatti, with whom he had a contest as to ability as clavichordist and organist, and winning fresh laurels.

=Handel in England=.—In 1707, he became music director to the Elector of Hanover, but quickly left the post for England, where, with the exception of short intervals, he passed the remainder of his life, becoming a naturalized English subject. It was no wonder that he was so warmly attached to his adopted country, since he became the popular idol, even winning over the king, George I, formerly Elector of Hanover, who, on his accession to the throne, was at first angry with Handel for his desertion of the post in his service at Hanover.

[Illustration: GEORGE FRIEDRICH HANDEL.]

=Handel's Operas and Oratorios=.—Handel was of an irascible disposition, and, living in the artificial atmosphere of London, among wits and satirists like Dr. Johnson, Addison and Pope, he was constantly embroiled with the cabals of his rivals, and the fickleness of the public. He produced a great number of operas, most of them successful; but as theatrical manager he met with severe losses, and finally gave up opera writing in despair, and turned to the composition of oratorios. The result was that in this form he has left his most enduring and elevated compositions; for while his operas were sometimes written down to the popular taste for empty Italian melody, the lofty themes of his oratorios inspired him to his grandest and most sincere style, which, moreover, was rendered the more dramatic and intelligible by his knowledge of the requirements of his audiences.

=Handel's Clavier Works=.—Handel was an expert performer on the harpsichord, for which he wrote two sets of Suites, besides a number of single pieces. The Suites, of which the first set is by far the better, are written mostly in the _dance forms_, but with the interpolation of more serious forms, such as Airs, Variations and Fugues. The _contrapuntal style_ is here most _prominent_, although _with harmonic basis_, and with a laxity in the strictness of the voice writing, caused by the occasional use of extra notes to complete chords. Some of the variations are worked up to effective climaxes, and have running passages and broken chords, in which the resources of the clavier are cleverly drawn upon.

=Handel's Last Years=.—Handel became blind in 1752, but continued to take part in the performances of his works till the year of his death. Choleric as was his temperament, the known generosity of his nature and his devotion to the ideals of his art made him the idol of the English people. He was buried in Westminster Abbey.

=Mattheson=.—A close associate of Handel, when he was in the Hamburg orchestra, was =Johann Mattheson= (1681-1764), famed for his literary writings on musical subjects no less than for his musical ability. He wrote suites, a sonata and fugues in two parts, for clavier, which were of excellent workmanship.

=Bach's Early Life=.—But all other names in the domain of polyphonic instrumental music pale before that of =Johann Sebastian Bach=, the culmination of the school of voice writing, and the musician who put the stamp of greatness on all former styles, while at the same time acting as guide to future fields of composition. Born at Eisenach in 1685, as a scion of a family the members of which had been musical leaders for generations, he seems to have embodied in himself the sum of the genius of his forefathers. The story of his life is a prosaic one, as he filled it with unflagging industry, carrying out his unswerving ideals of his art, caring little for mere popularity, and rearing a large family of sons and daughters, some of whom proved worthy to continue his work. As a boy, he lost both parents at the age of ten, and was taught clavier playing by his elder brother, Johann Christian, who took him in charge. He seized with avidity every opportunity to study his beloved music, copying hundreds of pages of manuscript, listening to every musical performance possible, drinking in and assimilating the ideas thus gained, to reproduce them later on, stamped with his genius.

=Later Life=.—At his brother's death he went to Lüneburg as choir boy, where he became acquainted with Reinken's work. At eighteen he was violinist in the court band at Weimar, shortly afterward becoming organist at a church at Arnstadt. His next position was as court organist at Weimar, in 1708, where many of his most important organ compositions were written. This post he left in 1717 for that of court chapel-master at Anhalt-Köthen, where he remained six years, after which he went to Leipzig, as Cantor of the Thomasschule, staying there till his death, in 1750.

=Incidents of Bach's Career=.—Bach's life was not altogether a happy one, as he was much annoyed at the persecutions of his rivals; and, like Handel, he was afflicted with blindness in his last years. Never considering the element of mere popularity in his work, his greatness was little appreciated in his lifetime; and it was fifty years after his death before it began to receive recognition. A pleasant incident of his declining years was his cordial reception by Frederick the Great at his court, in 1747, where Bach's son was in favor as harpsichord player, and where Bach was shown a number of excellent new Silbermann pianofortes. It is a curious circumstance that he and Handel, although born in the same year, were destined never to meet.

=The Well-Tempered Clavichord=.—It has been stated that Bach adopted the principle of Equal Temperament for clavier tuning. In support of this he wrote twenty-four preludes and fugues, one in each major and minor key, requiring, therefore, equal temperament for their performance; and later added a second similar volume. The whole forty-eight make up the monumental work called the "Well-Tempered Clavichord"; and this work, written originally for the clavichord, has remained the bulwark of piano playing to the present day. Its fugues, written with consummate mastery of the technic of instrumental polyphony, are not only models of skill in voice writing, but also are made the vehicles of genuine moods and emotions; while each preceding prelude gives the keynote of expression to its following fugue, although written in a much freer style, frequently closely allied with the works of the purely harmonic school.

[Illustration: JOHANN SEBASTIAN BACH.]

=Bach's Other Clavier Works=.—Bach wrote also sonatas and concertos, the latter for one, two or three claviers, sometimes with string accompaniment. These works, although comprising several movements, _do not_ otherwise _coincide_ with the _harmonic sonata form_, since their style is more polyphonic, and since they are occupied mainly with the _development_ of a _single_ subject. His suites, of which he wrote two sets, called respectively English and French, are no less important, since in them the dance forms are invested with a seriousness and an artistic finish hitherto unattained. Of other clavier works, his famous "Chromatic Fantasie" has a wealth of harmonic combinations, fiery runs and arpeggios, and dramatic recitative which give it a worthy place in the Romantic school developed much later, and of whose style it was the forerunner. His "Inventions," studies written originally for his children, in two or three parts, are an excellent introduction to the study of his larger works.

=Reforms in Fingering=.—Another gift of Bach's to coming generations was his _thorough revision of clavier playing_. Raising the hand above the keys from its former flat position, he _brought the thumb into use_, and by inventing the scale fingering, afterwards universally adopted, he opened the way to the style of brilliant and smoothly running passages which was afterwards so highly developed. Thus Bach, while putting the final touch to the old forms, gave an impetus to the harmonic style, which was then in its infancy, and of which we shall now trace the course.

QUESTIONS.

Compare the Italian and the German tendencies.

Give an account of Hasler.

Tell about Froberger. In what styles did he write?

Tell about Kerl, Pachelbel and the Muffats.

What advances do we find in the works of the composers of the early part of the 18th century?

What forms now begin to take definite shape?

Give a sketch of Handel's early life.

Give a sketch of Handel's work in England.

State the characteristics of Handel's clavier works.

What affliction befell him during the last years of his life?

What associate of Handel's was famous as writer and composer?

Tell about Bach's early life.

Tell about Bach's later life.

What great king invited Bach to visit his court?

Describe the "Well-Tempered Clavichord."

Mention other clavier works by Bach.

What improvements in technic did Bach introduce?

LESSON XXIX.

THE GERMAN SONATA COMPOSERS, TO HAYDN.

=Formation of Harmonic Design=.—Side by side with the ultimate development of polyphonic music in its perfected instrumental form, the forms of the new harmonic style were being worked out, by long processes of development. Finally, just as the Fugue came to be adopted as the highest form of the old school, so the Sonata was chosen as the most dignified exponent of the new art. But, while the old school arrived at a high state of perfection at the hands of Handel and Bach, the necessity for inventing and experimenting with the possibilities of the new forms made the first attempts in this direction seem childish and crude beside Bach's work; so that it was several generations after him before the harmonic style was brought to the stage at which it could be made to express ideas of equal magnitude, and do it successfully.

=Development of the Sonata=.—The original plan associated with the Sonata was that of combining several movements in such a way as to appeal, in the completed product, to all kinds of _emotion_, _intellectual_, _spiritual_ and _physical_. In the hands of its founders, the Italian violinists, the exposition of this thought had been mainly contrapuntal. We have seen how Domenico Scarlatti arrived at a style in which a single part, supported by an accompaniment, was applied to the clavier, in a manner which brought out its striking characteristics; and we have now to trace the progress of this style in Germany, up to the point where the various contributions of different composers could be united into a systematic and fixed form, sufficient for the free expression of the highest musical inspiration, and adapted to all the varied demands of instrumental music.

=Essential Elements of a Sonata=.—Certain points seem to have been generally agreed upon as necessary components of the Sonata. The first was its _union_ of _several movements_, from two up to five, or occasionally even more. The second was that the _first movement_ should display the most _ingenuity_ and _elaboration_. This movement thus came to receive the most attention,

and showed a process of evolution from the simple dance form consisting of a modulation from a principal key to a contrasting key and back again, to a _highly organised_ and conventional _art-form_—a form, moreover, of such a capacity that it could be used as the mould for the principal movement of a wide range of compositions, from a short pianoforte sonata to a grand symphony.

=Changes in the Old Dance Form=.—In this evolution, the first half of the dance form was made to consist of a Subject, either thematic or melodic, clearly defining the key, and then a modulating passage, generally freer in its runs and arpeggios, leading up to the point of contrast; and the first section was then repeated. The greatest changes took place in the second half. At first, this consisted in the repeat of the Principal Theme in the contrasting key, and a return to the first key through modulations similar to those in the first section; later, however, since this design gave little opportunity for a display of the composer's originality, the enunciation of the Subject in the contrasting key was followed by a free passage, which gave ample scope to the composer's fancy; after which the subject again appeared in the principal key, with a concluding passage in the same key.

=Establishment of the Cyclic Form=.—The form as a whole was now practically divided into three sections, and a better balance was given to this division by the omission of the second appearance of the Subject in the contrasting key, and the substitution of other material, either relevant or contrasting. The movement now assumed a cyclic form—a statement, leading to a point of contrast, a free fantasia, and finally the statement, leading to a close. This was practically the course of development of what has been named the Sonata Form, up to the time of Haydn. We are now prepared to consider the especial contributions of composers to this form.

=First Printed Clavier Sonata=.—The first printed clavier sonata seems to have been published by =Johann Kuhnau= (1660?-1722). This was in the key of B-flat, and was the last of several pieces in the same volume. In the preface, the author gives a semi-apology for its introduction, saying that he sees no reason why sonatas should not be written for the clavier as well as for any other instrument. This sonata begins with an Allegro, followed by a fugal movement; and in the following Adagio movement, the tendency to put the slow movement into a contrasting key is illustrated, as this is in D-flat major. After another Allegro, there is a _Da Capo_ to the first part.

=Other Sonatas by Kuhnau=.—It was difficult for the early sonata writers to break away entirely from the old polyphonic style; and when a part appeared in the nature of a Free Fantasia, they generally had recourse to fugal work, having _no precedent_ in _harmonic music_ to fall back upon. Thus, in his seven sonatas published in 1696, entitled "Fresh Fruits for the Clavier," which show more individuality in melodic invention, Kuhnau uses the fugal style whenever the harmonic forms fail him. These sonatas show a prevalence of ornaments, which, he says, are "sugar to sweeten the fruits." A remarkable collection of clavier pieces are his six Bible sonatas, in which the form is entirely outside of the development traced above, since the various movements of each sonata simply follow the lines of a Bible story, like that of the "Combat between David and Goliath," which they illustrate. As samples of program music, they proceed in the steps of Pachelbel, and others on record. Kuhnau studied law, and was from 1682 organist at St. Thomas' Church, at Leipzig, where he preceded J. S. Bach.

=Frederick the Great's Influence=.—A great impetus was given to German clavier music by the interest with which, like all other forms of instrumental music, it was viewed by Frederick the Great of Prussia (r. 1740-86). This warlike but thoroughly Teutonic monarch gathered at his court a brilliant coterie of instrumentalists, delighting to perform with them on his favorite instrument, the flute. Although this musical inspiration was disturbed by the wars in which he engaged, and especially by the Seven Years' War (1756-63), the growth of clavier music was nevertheless steady.

=Musical Journals=.—A number of musical journals which appeared from 1760 on, contributed also to this enthusiasm, in giving clavier composers a medium for bringing their works before the public, and also in giving them the chance to profit by one another's experiments. Many writers thus came to the fore, who aided materially in the elaboration of harmonic music material.

=Other Early Composers=.—Of these, =Gottfried Heinrich Stoelzel= (1690-1749), chapel-master at Saxe-Gotha, wrote an "enharmonic" clavier sonata in three parts, a Largo in C minor, in 4/4 time; a short fugue; and a 3/8 movement, in harmonic form, in which experiments in modulation were tried. His successor at Saxe-Gotha was =Georg Benda= (1721-95), who published a number of clavier pieces and sonatas, besides two concertos for clavier and string quartet, all of which show a desire for genuine expression in the harmonic form. The first four-hand sonatas seem to have been published by =Charles Heinrich Müller=, of Halberstadt, in 1783, and another appeared in 1784, by =Ernst Wilhelm Wolf= (1735-92), court chapel-master in Saxe-Weimar, the writer of numerous other clavier sonatas and concertos showing great purity and originality of style. At the court of Frederick the Great, at Berlin, =Christoph Nichelmann= (1717-62), a pupil of Bach, and =Carl Fasch= (1736-1800) were successively second

harpsichordists. Both wrote sonatas, those of the former in two movements, while those of the latter had generally three, of a brilliant and attractive style. =Friedrich Wilhelm Marpurg= (1718-95), the distinguished Berlin theoretician, was more successful in contrapuntal work than in his sonatas, written in freer style.

=Georg Christoph Wagenseil= (1715-77), pupil of J. J. Fux, court music teacher and celebrated clavier virtuoso, wrote sonatas for clavier and violin and a number for clavier alone.

=Wilhelm Friedemann Bach=.—Perhaps the most striking developments, however, were at the hands of the sons of J. S. Bach, who were all, having come under his direct instruction, of refined musical judgment, while some of them possessed marks of his genius. Of these, =Wilhelm Friedemann Bach= (1710-84), the eldest, called the Bach of Halle, from his long residence there, studied at the University of Leipzig, distinguishing himself in mathematics; was organist at Dresden and Halle successively, and finally came to Frederick the Great's court, at Berlin, through the influence of his brother Carl. Although he possessed great gifts as a player and composer, his dissipated habits brought him to disgrace, and he died in poverty. He wrote many clavier compositions, showing a bold use of harmonies, and including sonatas which have decidedly instrumental themes and development. A large number of his father's manuscripts known to have been in his possession have been irretrievably lost.

=Johann Christian Bach=, the London Bach, youngest of J. S. Bach's sons, was born at Leipzig in 1735, and died at London in 1782. He studied with his brother, Carl, after his father's death, and, afterwards going to Italy, became organist at the Milan Cathedral. Gaining great favor in this capacity, he was appointed concert-director at London in 1759, and there he became a popular favorite, producing several operas and receiving the appointment of music master to the royal family. His Italian experiences influenced his sonata writing, as his _subjects_ are in the style of the popular, though somewhat trivial _Italian melody_. Yet he introduced some striking improvements, notably that of employing a _second contrasting subject_, instead of a mere modulating or closing passage, at the end of the first and third sections of the sonata form. His graceful and melodious works were fashionable in London society.

[Illustration: C. P. E. BACH.]

=C. P. E. Bach=.—The third and greatest of Bach's sons was =Carl Philip Emanuel Bach=, the Berlin Bach. Inheriting his father's love of genuine and forceful expression, he had no less lofty ideals of his art, though recognizing his inferiority in talent. Also, perceiving that the harmonic school was in the line of progression, he devoted himself to it, thus producing purely _harmonic works_, which were only limited by the lack of resources thus far discovered. He was born at Weimar, in 1714, and, though a student of law and philosophy at Leipzig, he finally decided to give rein to his natural bent toward the musical profession. Conducting and composing for a musical society at Frankfort, he was appointed first clavier player at the court of Frederick the Great, at Berlin, where he stayed from 1740 to 1767, in high favor on account of his sterling musicianship, and enjoying the society of many distinguished musicians of the day. In 1767, he became musical director of the principal church in Hamburg, where he remained till his death, in 1788. A vigorous worker throughout his life, he left a large number of compositions, including two hundred and ten clavier pieces and fifty-two concertos for clavier and orchestra, besides much chamber music, eighteen symphonies, oratorios and cantatas.

=C. P. E. Bach's Sonatas=.—His most enduring and important work was in connection with the pianoforte sonata, since under his hands it began to assume _definite shape_. In the six sets of sonatas published, the number of movements is generally fixed at three, of which the third is frequently in the harmonic form of the Rondo, which consists in the recurrence of a principal theme, with modulatory episodes between its appearances. Hence the order of movements, which, in the earlier writers, took all sorts of forms from fugue to dance form, becomes Allegro, Adagio, Rondo. Bach's _themes_ are also made very characteristic, founded upon some easily-recognized _instrumental figure_. In the _development_ portion of the sonata form he does not resort to the polyphonic style, but _uses phrases or sections from the first part in new combinations and keys_. Sometimes, also, the direction is given in the repeat of the first section, to introduce variations of the text at will.

=His Theoretical Works=.—Bach published at Berlin, in 1753, an essay on "The True Method of Playing the Clavier," in which he gives a definite exposition of his father's reforms in playing, treating the position of the hand, embellishments and artistic rendering, which he says should touch the hearts of the hearers. A second part, published in 1762, discusses the science of accompaniment and improvisation.

=Adoption of the Piano=.—The clavichord, notwithstanding its feeble tone, remained his favorite instrument on account of its powers of expression, in which he delighted. His brother, Johann Christian, was one of the first definitely to adopt the new

pianoforte. J. G. Müthel published in 1771 what were probably the first compositions mentioning the pianoforte for their performance, a duet for two pianofortes or harpsichords; after the time of C. P. E. Bach, clavier compositions were written in general distinctively for the pianoforte and not for the clavier.

QUESTIONS AND SUGGESTIONS.

What forms of composition were being worked out while the polyphonic style was reaching a culmination?

What style had been most prominent in the early sonata?

What points had been agreed upon as necessary in the construction of the sonata?

What changes were made from the simple dance form?

In what part of the sonata did the greatest change occur?

What was the course of development in sonata form up to Haydn?

Tell about Kuhnau and his work.

Tell about other early composers.

Tell about Wilhelm Friedemann Bach.

Tell about Johann Christoph Bach.

Tell about Carl Philip Emanuel Bach.

Tell about Carl Philip Emanuel Bach’s contribution to the development of the sonata.

What other works did C. P. E. Bach write?

A comparison of the dates from Kuhnau’s published work in Sonatas to that of C. P. E. Bach, the immediate predecessor and model for Haydn, shows that the form took definite shape in the course of about fifty years.

[Illustration: FRANZ JOSEPH HAYDN.]

LESSON XXX.

FRANZ JOSEPH HAYDN.

=The Three Great Sonata Writers=.—In the year of C. P. E. Bach's death, 1788, three men had already entered the arena as champions of that Sonata Form to which he contributed so much. Haydn was then fifty-six, Mozart thirty-two and Beethoven eighteen years of age. All three added to the glory of Vienna by making it their dwelling-place in their later years; and the three formed a triumvirate which not only gave to the Sonata a permanent and complete form, but also brought this form into absolute subservience to the expression of every variety of emotional thought.

=Haydn's Childhood=.—Franz Joseph Haydn, a native of Rohrau, in lower Austria, was born on March 31, 1732, the second of a family of twelve children. His father, an humble wheelwright, was accustomed to bring his family together in the evenings and holidays, as was the German custom, to unite in song; and the true ear and feeling for rhythm of little "Sepperl," as Joseph was called, was quickly noticeable. So a cousin of his father, who was a schoolmaster at Hainburg, was allowed to take the boy home with him, placing him in the school choir, and directing his studies, which included singing, and the playing of the violin and other instruments.

=St. Stephen's Choir, Vienna=.—George Reutter, precentor of St. Stephen's Cathedral, at Vienna, paid a visit to the school and was attracted by the child's "sweet, weak voice," as he expressed it, and offered him a position in his choir. As this was considered a rare opportunity, he was allowed to go, and at the age of eight we find him installed in the choir school at Vienna, attending the daily service and choir practice, besides the regular school studies. But Reutter seems to have lost his personal interest in the lad, neglecting him in various ways, doing nothing with his work in musical theory, and finally dropping all his tuition. Haydn was fond of mischief; and when his voice began to break and his brother Michael became soloist in his place, his cruel master took the pretext of some trifling prank to turn him adrift, penniless, into the street.

=Hardships in Vienna=.—At the age of seventeen, therefore, he wandered the streets all of one rainy November night, with no friend to whom to turn. Finally, in the morning, he met an acquaintance formerly at the school, Spangler, a tenor singer, himself nearly as poor as Haydn. Nevertheless, he took the outcast home to his garret, where he was eking out an existence with his family; and thus temporarily provided for, Haydn set about finding work to do. Small jobs, like playing in bands, or at weddings and baptisms, and singing in choirs, he eagerly sought; his spare moments he occupied in writing music for serenades or garden-parties. While undergoing these hardships, however, he was becoming familiar with the music dear to the people's heart, and also with the varied effects of instrumental combinations.

=Studies and New Friends=.—In 1750, he rented a garret in a house in Vienna, and, having secured a dilapidated spinet, set himself diligently to work to study all available musical compositions, notably those of the new sonata order, and especially the sonatas of C. P. E. Bach. Theoretical works, also, like the "Gradus ad Parnassum" of J. J. Fux, and Mattheson's work on conducting, were eagerly devoured by the youthful enthusiast. By a piece of good fortune, Metastasio, the popular opera librettist, roomed in the same house, and learning of the talent hidden away in the garret, sought Haydn out, gave him Italian lessons, and ultimately started him on the road to success by recommending him as clavier teacher to a Spanish lady, to whose daughter he gave lessons.

=Connection with Porpora=.—Her singing master was the renowned opera composer, Porpora, who recognized Haydn's talent as accompanist, and proceeded to make him useful to himself, giving him instruction in composition in return for his services, which were frequently of even a menial nature. Accompanying Porpora on his journeys, he met musicians like Wagenseil and Gluck; and at the age of twenty had written many compositions, including a mass in F, an opera and many works of the sonata order, founded on the style of C. P. E. Bach.

=Better Times=.—Better times now opened before Haydn. Gaining influential friends, he won, through them, the post of music director and composer to Count Morzin, a position which he held only a short time, since the Count gave up his musical establishment soon. But he was immediately engaged by the wealthy and cultivated Prince Paul Esterhazy, who had been charmed at hearing a symphony of Haydn's, as assistant director of music at his estate at Eisenstadt. The same year Haydn made an unhappy marriage with the daughter of Keller, a wigmaker, which he had cause to regret for the remainder of his life.

=Orchestras in Germany=.—To understand Haydn's work with the Esterhazy family, it will be necessary to review the state of music in Germany at this time. When the orchestral overtures of the Italian operas had become used as concert pieces, a great stimulus was given to this kind of music. Concertos, string quartets, trios, and, most important of all, symphonies, came to be written in great numbers; and throughout Germany a mania for orchestral music arose. Wealthy families vied with each other in the size and prestige of their musical establishments, which included instrumentalists and vocalists; and the smaller gentry even

pressed their domestic servants into the service, inducing them to study instruments, and to perform string quartets and the like on occasions. Inasmuch as a great part of the music written for these was not published, and exchange of music in manuscript between different establishments was attended with some difficulty, it was necessary that the music director should have the ability to write his own music, as well as to direct it.

=Haydn's Work at Esterhazy=.—A rare opportunity therefore opened to Haydn, with his exceptional gifts as a composer, when he was placed at the head of an establishment like that of the Esterhazys', which was perhaps the most brilliant and competent in Europe. He remained in active service with this family for thirty-three years, during which Prince Nicolas Esterhazy succeeded his brother Paul, upon the death of the latter, in 1762. Nicolas, called the "Great," on account of his love of magnificence and his lavish style of living, built a sumptuous summer palace near Süttor, in Bohemia; and here he spent most of his time, with his troup of retainers, entertaining royalty, in a style comparable with that of Versailles. Werner, his head director, who had never appreciated Haydn's gifts on account of his old-school principles, died in 1766, and Haydn, who had made a firm friend of Prince Nicolas, was given his place. The orchestra and singers were now entirely under his command; the former was increased from the original number of sixteen to thirty, all capable performers; so that his life was spent in a round of rehearsals, dramatic performances and concerts for the numerous entertainments constantly in progress. Two well-equipped theatres, one for operas and dramas, and the other for marionette plays, gave him an opportunity for adequate performances; he thus had an exceptional chance to study the effects in his numerous quartets, trios, symphonies and operas, at first hand.

=Journeys to Vienna=.—On several occasions, Prince Nicolas took his entire troupe of musicians to Vienna, where Haydn conducted the performances, meeting also the distinguished musicians of the day. It was on one of these journeys, in 1785, that he met Mozart, whose genius he was quick to appreciate, and who, from being his pupil, finally gave to Haydn the added inspiration of his own brilliant thoughts. Haydn's reputation had now spread abroad, and his compositions were eagerly looked for throughout the musical world.

=Haydn in London=.—On Prince Nicolas' death, in 1790, Prince Anton, his brother, succeeded, who, however, dismissed the orchestra, providing for Haydn by a liberal pension. Haydn's time was now his own; and he decided to settle in Vienna; but an English impresario and publisher named Salomon now offered him such exceptional inducements to come to London that he accepted the offer. He was received with great honor, being granted the degree of Doctor of Music from Oxford University. He also conducted twelve grand symphonies, especially written for this visit, which were, moreover, some of his finest productions. On a second visit, in 1794-5, he excited even greater enthusiasm; and he returned to Vienna supplied with money sufficient to insure an old age free from pecuniary want. Some of his latest works were the Austrian National Hymn, and his oratorios of "The Creation" and "The Seasons," which immediately attained a popularity that has even yet hardly diminished.

=Honors=.—Haydn, in his old age, was showered with honors both at home and abroad; a culminating point was reached when, on his seventy-sixth birthday, at a performance of "The Creation," his friends, including many representatives of royalty, united to do him honor. His genial, child-like disposition won him the sobriquet of "Papa Haydn"; and this brightness and simplicity of thought he so transmitted to his compositions that they carry his atmosphere of sunshine wherever they are performed. He died in Vienna, soon after its capture by the French, in the Napoleonic wars, May 31, 1809.

=Importance of His Work=.—Haydn has been called the father of the Symphony and the String Quartet. In neither case is this strictly true, since he had predecessors in both fields; but his work was none the less important, since he collected the scattered threads of their attempts, and wound them into a concise and definite art form, stamped with the hallmarks of his own genius. The seal of artistic completeness which he placed on the form of the Sonata was his greatest achievement; and, written in this form, his symphonies and quartets were simply an enlargement of his clavier works, the symphonies having an added Minuet movement between the second and last movements of the clavier form of sonata, thus extending the piece to larger proportions.

=Sonata-Form as Fixed by Haydn=.—In these clavier sonatas, Haydn fixed the form which had been the subject of so many experiments, once and for all. The number of movements with him is almost invariably three, of which the first, at least, is in the sonata-form. This consists of a first section, the =Exposition=, in which the first subject, a distinct melody having the Teutonic individuality, is stated, defining the principal key; and a second subject, more lengthy and diverse in character, brings on a close in the contrasting key. In the second section, or =Development=, phrases or motives from the first section are cleverly intertwined in modulating keys, with running scales or arpeggios as connecting links. These, however, lead naturally into the first subject, in its original key, which opens the third section, or =Reprise=. This section is practically like the first, save that the second subject and the close are transferred into the principal key, in which the movement ends.

=The Second Movement=.—The second, or slow movement, is cast sometimes in the same form, abbreviated, and sometimes in a simpler form. The lack of sustaining power in Haydn's pianoforte, and his attempt to atone for this by trills and ornaments, make this less successful than the other movements; a result which is also caused by the fact that intensity and depth of emotion had not yet been developed in the harmonic school of music. In key, this movement was contrasted with the first, sometimes quite sharply, as in one of the sonatas in E-flat, in which the slow movement is in E major.

=Third Movement=.—The lively third movement is frequently in the lighter form of the Rondo, or it may be a set of Variations, or a Minuet. This movement, though sprightly, is apt to be somewhat thin in its harmonies, and trivial in development. Nevertheless, these last two movements show an expansion of the forms of the older writers, and a definiteness of character which insured their future development.

=Definiteness and Unity=.—This element of absolute definiteness is the most striking feature of Haydn's work—definiteness none the less in the general form than in each individual component. Each part of each section ends with a cadence, giving it absolute finality, and making the whole a combination of small entities, which, though distinct, are yet relevant and nicely balanced.

=Humor and Freshness=.—Another quality which he introduced was that of humor, which is prominent not only in the general tone of geniality, but in little unexpected twists of harmony, melody or rhythm, which give an irresistibly comic effect. Especially is this true in his symphonies, where the various tone colors are used for such results. Especial mention should also be made of his Masses, in which tunefulness of melody and sprightly rhythms combine to give an enduring popularity. Altogether, Haydn's work is redolent of the spring of musical activity, where the novelty of each harmonic effect is employed with an outburst of joy, and where one travels, as it were, through a sunny garden, filled with the flowers of musical thoughts.

QUESTIONS.

Who are the three great sonata writers?

Tell about Haydn's childhood.

Tell about Haydn's life in Vienna.

Give an account of Haydn as a student.

What great singing master did he meet?

What patrons did Haydn gain? What was the value to the musical art of the patronage of the great nobles and princes?

Describe Haydn's duties and opportunities in Prince Esterhazy's service.

What great composer did Haydn meet in Vienna in 1785?

When Haydn's service ceased, to what city did he go? What works did he bring out there?

What was the importance of his work to the Sonata and the Symphony?

Describe the first movement-form as fixed by Haydn.

Describe the second movement as fixed by Haydn.

Describe the third movement as fixed by Haydn.

Name certain qualities characteristic of Haydn's music.

What great American was born in the same year as Haydn?

Name men and women of prominence who were contemporaries of Haydn.

LESSON XXXI.

WOLFGANG AMADEUS MOZART.

While Haydn's genius was shining steadily as a fixed star, Mozart flashed across the musical heaven, meteorlike, throwing a flood of light over the music world. The knowledge which others spent years in acquiring seemed his by birthright; and thus, although the years of his life were few, the period of his artistic activity was proportionately long.

=Mozart's Early Musical Training=.—Wolfgang Amadeus Mozart was born at Salzburg, January 27, 1756. His father, himself of some reputation as a composer and as the author of the first German violin method, was quick to perceive the child's sensitiveness toward music; and began instruction in clavier playing when Wolfgang was but four years old, teaching also his daughter, Maria Anna, five years older. Wolfgang was an exceedingly delicate and receptive child; and at the age of six he had not only acquired remarkable proficiency on the instrument, but had composed a number of little pieces, and a clavier sonata.

=First Concert Tours=.—Realizing the remarkable talent of his children, Mozart, the father, in 1762, ventured on a concert trip with them to Munich, and later to Vienna, where their playing became the sensation of the hour, and where they were received by the Emperor, Franz Josef I, at his palace. Having been presented with a small violin, Mozart acquired facility in its technic with extraordinary quickness, as also was the case when he attempted the use of organ pedals. The brilliant French court was then the Mecca of artists; and in 1763, the children were taken to Paris, where their successes were redoubled, and where they gave two brilliant concerts, after having played before the royal family at Versailles. At Paris, moreover, the opus 1 and opus 2 of the little Mozart were published, each comprising two sonatas for harpsichord, with accompaniment of violin or flute.

=England=.—Proceeding now to England, the children won fresh laurels, remaining there fifteen months; during which time Wolfgang excited the admiration of the king, George III, by his sight-reading of works by Handel, Bach and others. He also wrote other sonatas, and his first symphonies. Returning to Salzburg, after a three years' absence, Mozart applied himself to serious study, composing his first oratorio and opera, which latter was not performed in public, and also appearing as conductor at a concert in which his "Solemn Mass" was performed.

=Honors in Italy=.—Renewed triumphs awaited him in Italy, where his father took him in 1769, and where his genius was immediately recognized in the leading cities. At Rome he was honored by the Order of the Golden Spur, conferred by the Pope; and in Bologna was admitted to membership in the exclusive Philharmonic Academy, passing with ease an examination which would have appalled many mature musicians; in Milan his opera "Mitridate" was received enthusiastically, and given twenty consecutive performances, under his own direction.

=Journey to Paris=.—Returning to Salzburg, Mozart took up the post previously given him of music director to the Archbishop; but his emolument, at first wholly wanting, was insignificant, and the Archbishop, having little appreciation of his abilities, proved a thankless taskmaster. During this time he made several journeys to Milan, producing new dramatic works there; and in 1777, as his Salzburg position had become intolerable, he resolved to give it up, and to repair to Paris. Starting on this journey with his mother, he stopped at Munich, and then at Augsburg, where he became interested in the Stein pianofortes, henceforth adopting them for his concert work. At Mannheim he heard the famous orchestra, of which Stamitz was the founder, whose command of instrumental brilliancy and color made so powerful an impression upon him that he transmitted it to his succeeding orchestral compositions.

[Illustration: WOLFGANG AMADEUS MOZART.]

=“Idomeneo” and “Il Seraglio.”=—At Paris, he found society divided into two warring operatic factions, led by Gluck and Piccini, and averse to anything else in music. Saddened also by the death of his mother, he returned to Salzburg, and resumed his former post with the Archbishop. Receiving an order to write an opera for the Carnival at Munich, he produced his “Idomeneo” there in 1781. Shortly after, he was compelled, through ill-treatment, to break finally with the Archbishop, and he resolved to settle in Vienna. In the same year, 1782, in which he produced there his opera, “Entführung aus dem Serail,” composed by command of the Emperor, he married Constance Weber.

=Financial Troubles=.—His life from this time was a constant struggle against poverty; for notwithstanding his wonderful genius, he received only scant recognition from his patron, the Emperor, although loyal to him to the end. His existence was eked out chiefly by the sale of his compositions, which publishers purchased at a low price, by giving lessons and by playing at concerts; while the jealousy of rivals furnished a constant source of annoyance.

=“Figaro,” “Don Giovanni” and Symphonies=.—His comic opera, “The Marriage of Figaro,” produced in Vienna in 1786, came near failing through these enemies, but was an unqualified success in Prague, where, in the following year, his masterpiece, “Don Giovanni,” was produced. On a concert tour in 1786 he was offered an excellent post in the service of King Frederic Wilhelm II, of Prussia, which he refused, through loyalty to his Emperor—a devotion which received no reward save an order to write another opera. In the same year, 1789, his three most important symphonies were completed—the “Jupiter,” in C, and those in G minor and E-flat major.

=Other Operas=—=Death=.—His succeeding operas were “Così fan Tutte,” performed at Vienna in 1790; “The Clemency of Titus,” given at Prague in 1791, for the coronation festivities of King Leopold II of Bohemia, and “The Magic Flute,” produced at Vienna in 1791, which, through its German subject and style, was a signal success, especially in his own country. Discouragements and hard work now told upon him; and in the midst of his labors upon a grand Requiem, he was stricken down, and died December 5, 1791.

=Relations with Haydn=.—No one admired Mozart’s genius more than Haydn; and a proof of the latter’s freedom from the petty jealousies of lesser men is found in the fact that, while he was at first Mozart’s teacher, he was afterward glad to adopt many of the innovations which were the result of Mozart’s genius. The labors of the two men admirably supplemented each other; for Mozart assimilated and blended what Haydn had definitely stated, adorning the rugged outlines with the graceful draperies which his skill as a performer and his artistic nature dictated.

=Italian Influences=.—Thus, while Mozart adopted the form of the Sonata practically as enunciated by Haydn, he was able to impart new elements to it, drawn from his own experience and individuality. His Italian journeys, for instance, had brought him into close touch with the highly-adorned Italian opera style, then everywhere popular; and this he introduced into his instrumental _themes_, making them at once _singing_ and _graceful_ in tone. In the Sonata Form, he made the _second theme_ more definite, _contrasting_ it with the _first_, and frequently casting it in the form of an Italian style of melody, in distinction from a more terse and thematic principal subject.

=Mozart as Piano Virtuoso=.—As a virtuoso, Mozart immensely developed the resources of the piano. After the Bachs, J. S. and his son C. P. E., had established a rational scale fingering, and it was found possible to introduce passages at once quickly running and smooth upon the clavier, such scale passages became very frequent in the compositions of the time, and they were, moreover, well adapted to the light Viennese action found in the Stein pianos, which Mozart used. Hence we find _scale-runs_ as the _cornerstone of his virtuosity_, constantly employed in florid and transitional passages.

=Classic Finish=.—But Mozart’s compositions were not simply an advance in brilliancy, since his slow movements and themes are full of much genuine sentiment, and give opportunity for that expressive song-style which he emphasized so strongly. Moreover, his feeling for artistic finish caused him, by rounding off every detail, to avoid abruptness, replacing them by little delicate turns of musical expression and graceful embellishments, which give an atmosphere of _classic repose_ and finish to the whole.

=Variations=.—Embellishments of this kind are introduced invariably with such naturalness and fitness as to make them seem perfectly adapted to the subject in hand, and growing unconsciously out of it. So Mozart throws a network of _embroidery about his themes_ at their recurrence which shows their beauties to ever greater advantage. The ability to do this makes him a specially felicitous composer in the Variation form, in which some of his most attractive movements and salon pieces are written.

=Piano with Other Instruments=.—His sense of fitness is shown also in the vivid _contrasts_ which occur, especially in his Fantasias, in which brilliant passages are relieved by bits of exquisite melody, in artistic proportion. All these qualities are

manifested in his pianoforte concertos, which, while replete with flights of virtuosity, yet always subordinate, cause him to bring this into equal prominence with the piano, so that the one ably seconds the other in the attempt to produce a well-rounded and thoroughly genuine musical effect. The same qualities are exhibited in his sonatas for violin and piano, and in his piano trios.

=Especial Characteristics=.—Mozart considered three elements necessary for the true interpretation of piano music, namely, an _expressive legato touch_, _moderation_ in the rate of _speed_ of performance, and _strictness_ in adhering to the _time_ adopted. With an unfeeling touch or a breakneck velocity he had no patience, and so had no sympathy with many noted pianists of his day, and notably Clementi. It has been said that Mozart, almost from his infancy, thought in music as others do in words; and this thought in music was regulated by a sense of artistic combination and proportion which permeated all his works. As samples of virtuosity his piano works have long been surpassed by the astonishing developments since his time, and particularly by the added resources of the instrument itself; but as samples of pure and unaffected music their worth can never be diminished.

LESSON XXXII.

LUDWIG VAN BEETHOVEN.

=Formalism of Haydn and Mozart=.—It has been seen that the forms of harmonic music, growing out of numerous and sometimes crude experiments, were brought to a high state of perfection through the genius of Haydn and Mozart; and that they left a definite structure, nicely balanced, capable of expressing definite thoughts in a unified form, and at the same time of allowing free rein to the composer's fancy. Of their instrumental works, the definition of the musician-philosopher J. J. Rousseau (d. 1778), that "music is the art of combining sounds in a manner agreeable to the ear," gave a fitting characterization; for while a tinge of melancholy is occasionally perceptible, and there are passages of some dramatic intensity, nevertheless such elements are introduced mainly to give a pleasing contrast from the even flow of polished and idealized sound.

=Their Gift to Beethoven=.—In other words, neither Haydn nor Mozart ever sacrifices his sense of artistic finish to the expression of the heights and depths of human emotion. Putting the seal of genius upon instrumental forms, they transmitted these forms to another more colossal mind, which should make use of them, to be sure, but should absolutely subordinate them to the expression of the burning thoughts and passions of a great individuality; a mind which, like that of Shakespeare, was able to look fearlessly upon universal truths, and to bring these to the light, in this instance through the medium of tone. While their predecessors, by unwearying attempts, made possible this determination of a capable art form, so Haydn and Mozart, in their turn, paved the way for the fuller expression which Beethoven gave to music, and which would otherwise not have been possible, since the vehicle for his thoughts would have been wanting. Thus the opportunity had arrived for broadening the definition which Rousseau gave, and announcing the fact that music is the art of the expression of every emotion, whether pleasurable or painful, through the medium of highly organized sound.

=Beethoven's Early Life=.—Ludwig van Beethoven, the last and greatest of this triumvirate of sonata writers, was a native of Bonn-on-the-Rhine, where he was born December 16, 1770. His parents were lowly people, his father a tenor singer in the Elector of Cologne's chapel, and his mother a cook; and, moreover, Beethoven's early life was an unhappy one, through his father's irascible disposition and tendency toward dissipation. Beethoven, of an acutely sensitive nature, inherited his father's quick temper and annoyances at trifles, so that all through his troubled life he was constantly in a state of irritation against something or someone. Like Mozart, he showed early and unmistakable signs of a musical susceptibility; unlike him, however, the unfolding of his genius was ultimately slow, since he attained to his greatest powers much later in life than his phenomenal predecessor. His early instruction was begun with his father; but soon he was placed in the care of several local musicians: Pfeiffer, music director and oboist; Van der Eeden, the court organist; and especially the successor to the latter, Neefe (1748-1798), a man of reputation as organist and composer for the pianoforte. As a result, Beethoven played the violin well at eight, and at twelve had mastered the works of Handel and the "Well-Tempered Clavichord" of J. S. Bach. This intimate study of the best works of the old polyphonic school was of great advantage later in solidifying his gifts as a musician.

=First Compositions=.—In 1782, were published his first attempts at composition—a set of variations, and three sonatas; and these, together with his remarkable extempore playing, began to attract the attention of persons of influence. He was appointed organist at Bonn, and at sixteen was sent by the Elector Max Franz, brother of the Emperor Joseph II, to Vienna, where he received praise from Mozart, who predicted a brilliant future for him.

=The Breuning Family=.—In 1787, his mother died; and this loss, together with his father's intemperate habits, made his home extremely unpleasant. Fortunately for Beethoven, however, the enthusiasm for music which was rife in Germany at this time among people of culture and position was the cause of attracting to his side many true friends, who, appreciating his sterling qualities, were able to pardon his rough exterior and manners. Thus he was received as teacher and friend into the home of the cultivated von Breuning family, under whose refining influence he came into touch with the masterpieces of English and German literature. Here he first met his staunch friend, Count Waldstein; and here he had leisure for long walks amid the rural retreats which he heartily loved, and for meditation upon those musical ideas which he was accustomed to jot down in rough sketches, and which should later be translated into his immortal creations.

=In Vienna=.—Haydn, passing through Bonn, warmly praised a cantata of Beethoven's; and the Elector, moved by such marks of approbation, sent him again to Vienna, in 1792, for serious study. Here he was instructed by Haydn till the latter's departure for England, in 1794, when he went to Albrechtsberger, the celebrated contrapuntist, and others; but these exponents of an earlier school looked somewhat askance at the bold innovations which Beethoven introduced into recognized principles, and failed to understand the irrepressible genius which prompted them. Nothing daunted, he launched zealously into composition, supported by a growing circle of admirers to which the Elector's patronage had introduced him; and soon became a favorite at the private soirées of the nobility, where, on account of his eccentric manners, he was known as an "original," but where his wonderful extemporizing

was received with ecstasy.

=Successes as a Pianist=.—Beethoven's first public performance in Vienna occurred in 1795, when he performed his pianoforte concerto in C major at a concert. During a journey soon after, he played before King Friedrich Wilhelm II, at Berlin, who distinguished him with marks of favor, and to whom Beethoven dedicated two sonatas written for pianoforte with 'cello. Here also he met the conductor, =Friedrich Himmel= (1765-1814), a pianist and composer of high rank. We hear next of his trial of pianistic skill with Steibelt, a popular virtuoso, in which Beethoven won an overwhelming victory. With Wölfl, another distinguished rival, his relations were those of mutual esteem, and the two masters delighted to extemporize dashing capriccios on two pianofortes.

=First Period=.—The thirteen years, from 1790 to 1803, are usually considered to embrace his first period of activity as a composer, comprising his works to opus 50. His opus 1, three trios for piano, violin and 'cello, appeared in 1795, and soon after three piano sonatas, opus 2, dedicated to Haydn, were published. Among the other noteworthy works of this period were his first two symphonies, in C and D, three piano concertos, the piano sonatas including opus 27, the Kreutzer sonata for piano and violin, and his famous Septet for strings and wind instruments. In general, these compositions _follow_ closely the lines laid down by _Haydn_ and _Mozart_, although there is, notably in the piano sonatas, a gradual tendency toward freedom of expression, and the assertion of individuality.

Troubles now began to gather about him. About 1800 his hearing became defective, and the malady grew steadily from bad to worse, so that by 1816 he was obliged to use an ear-trumpet, and by 1822 he was stone-deaf. To add to his discomforts, his brothers Karl and Johann treated him shamefully, and a son of the former, to whom he was left guardian at the father's death, and upon whom he lavished a father's care, turned out a scapegrace, repaying his affection with the basest ingratitude. Weighed down by these misfortunes, Beethoven became irritable and morbid, distrusting his most faithful friends, and constantly imagining plots against himself. His utter ignorance of worldly matters, too, brought him into financial troubles, and involved his domestic affairs in a state of continual confusion.

=Second Period=.—Yet, as if to prove man's ability to rise superior to every affliction, during this very time he was writing compositions which, for joyous freshness and spiritual elevation, have been scarcely, if ever, equalled. During his second period, extending to 1815, and including his compositions to about opus 90, he adopted a _freedom of expression_ entirely untrammelled by formal limitations, enlarging and vivifying the Sonata Form, and varying it to suit his changing moods. The joy of living, with its intensity of passion and depths of emotion, is reflected in these works, which assert a character strong in its struggle against adverse fate, confidently looking toward the goal of ultimate good.

=Compositions of this Period=.—His most popular symphonies were written during this period, which embraces those from the third to the eighth, inclusive. The "Eroica," number three, was originally written in homage to Napoleon, whom Beethoven honored as the guide of the French nation toward that assertion of independence and individuality which he dearly loved; but when the news arrived that Napoleon was declared Dictator, in 1804, he tore up the dedicatory page in a fit of anger. Another of his greatest compositions was his opera of "Fidelio," upon which Beethoven spent an amazing amount of time and pains, whose overture he rewrote twice. Produced in Vienna, in 1805, soon after the occupation of the city by the French, it was received coldly; and only after several revisions did it score a success at all in keeping with its grand and inspiring conception. Several orchestral overtures; his violin concerto; an oratorio; a mass in C; some of his best chamber music, including the celebrated Rasumovsky string quartets; and his piano concertos in G and E-flat, were other fruits of about this time. Of fourteen piano sonatas, we find several which have continued in unbroken popularity, notably the two in opus 27, the "Pastorale," opus 28, the "Waldstein," opus 53, and the "Appassionata."

=Latter Years of His Life=.—The latter part of Beethoven's life, after 1815, was spent in Vienna, in a state of despondency from his troubles which his general recognition as the foremost musician of his day could scarcely alleviate. His many friends placed him, by their efforts, in comfortable pecuniary circumstances; yet he constantly imagined himself struggling with poverty. Sensitive to his affliction, he made himself exceedingly inaccessible, and passed his days in unceasing labor upon those works which eclipsed, in profundity and individuality, all of his former compositions, and which were an index to the conflicting struggles in his mind. Stone-deaf, he yet revelled in a spiritual world of tone, hearing his greatest compositions only in the realms of his imagination. An attack of pneumonia in 1826 left effects which proved lasting, and which caused his death on March 26, 1827. In his last illness he was surrounded by his circle of unfailing friends, among whom the modest Schubert was admitted; and a proof of his hold upon his countrymen is shown in the fact that 20,000 persons are said to have attended his funeral.

=Last Great Works=.—The greatest fruit of these later years was his last symphony, the Ninth, or “Choral,” in which, for the first time, he introduced voices as an aid to the instrumental climax. The free vent which he gave to his radical tendencies in this symphony, its unheard-of boldness of harmonic progressions, and its defiance of all conventional rules, aroused a storm of protest from his critics which was only lulled after succeeding generations had placed the stamp of unmistakable approval upon the work, and had recognized it as a monument of genius. Near to this in importance stands his “Solemn Mass” in D, a work imbued with all the religious fervor of his declining years.

=Sonatas of Third Period=.—Other notable achievements, in the line of chamber music, mark this period; and the last five piano sonatas, extending from opus 101 to opus 111, exhibit the same undaunted freedom that is found in the Ninth symphony. Enormous in their demands upon the pianist, they are food for none but virtuosi; but analyzed, they show a _compendium of_ all known _musical resources_, from the choral fugue to the most daring flights of harmonic expression.

=Beethoven’s Dual Personality=.—Beethoven furnishes an example of a personality whose dual nature is remarkably apparent. Often unkempt, and rude in his outward bearing, he seemed at times absolutely oblivious to his surroundings and to chafe at his bodily limitations; yet his apparent rudeness toward his friends was as often humbly atoned for by his confession of his haste in judging them. His independence of spirit could brook no submission to authority other than his own conscience; and that conscience prompted him to stand firm in support of the genuine, the pure and the ideal; firm, thus, in its abhorrence of artificiality and deceit. In his ignorance of worldly wiles he was on a par with a little child; finding his true sphere when buried in the lofty problems of his art, giving to the world the fruits of his innermost spirit, which were ever animated by nobility and truth of expression.

=Beethoven Stood Alone=.—Detesting the fetters of teaching work, he left few pupils. Among these =Ferdinand Ries= (1784-1838) enjoyed an intimate association with him, and afterwards became prominent as piano virtuoso and composer. With the great men of his day he affiliated but little. Goethe (1749-1832) he met but once, on one of his journeys; but the meeting had no further results. Like other great minds, his original ideas had to make their way amid a shower of abuse from more conventional contemporaries, who lauded as his equal or superior others whose works have long since passed into oblivion; but, fortunate in finding staunch defenders, he made steady progress against his enemies, until his position in the music world became unique and unassailable.

QUESTIONS.

What did Haydn and Mozart give to Beethoven?

Give a sketch of Beethoven’s early life.

What works did he particularly study?

What were his first compositions?

What intimate friends did he make in early life?

What city did he select as his home?

What years embrace his first period?

What are the leading works of this period?

What affliction developed in 1800?

What years compose the second period?

What changes came into his style?

Name the leading works of the second period.

Tell about Beethoven’s later life, from 1815 on.

What are the leading works of this last period?

Describe the personality of Beethoven.

LESSON XXXIII.

BEETHOVEN AND THE SONATA.

=Bach and Beethoven Contrasted=.—We now consider the exact nature of the work which Beethoven did, in distinction from that of Haydn and Mozart. It has been said that Bach gave the Old Testament in music, while Beethoven gave the New; that is, that Bach consummated the old polyphonic school, while Beethoven did an equal work for the new harmonic school. Yet this is only a half truth; for Bach, besides perfecting former styles, gave glimpses of modern chromatic modulation and free expression; while Beethoven, a student of the old masters, employed polyphonic forms as well as harmonic, making all work together to translate his thought, and so moulding them into a means of portraying every emotion as to open the door forever to the untrammelled presentment of thought, through the medium of music.

=Beethoven's Gradual Development=.—But Beethoven did not arrive at this result in an instant. It is true that, even in his early works, a distinction of style is shown which removes them from a mere imitation, but, as has been shown, he _began_ practically at the point _where Haydn and Mozart left off_, with compositions which can hardly be placed on a higher level than theirs; and, in the course of a life full of strenuous experiences, he gradually _unfolded the resources_ which he had received from his predecessors, until he made them adequate to give vent to the mighty ideas which welled from his soul. Thus we find in his works a period in which _form is rigidly observed_; and we pass thence through an era of expansion, during which _form becomes more elastic_, through the added requirements placed upon it, until the thought and emotion become so paramount that the _formal lines_ have entirely _disappeared_, and are only to be traced by careful analysis.

=Beethoven and the Orchestra=.—As the great exponent of instrumental music, Beethoven found the orchestra his best and fullest vehicle of expression. So his massive mind, grasping with ease the effects of manifold combinations of instruments, was able to mould his thoughts into terms of tone color in which each instrument should be employed to bring out the exact shade of feeling required. So the orchestra becomes with him a great individual instrument, responding to the slightest change of mood.

=Use of the Piano=.—But as a preparation for such orchestral work, Beethoven realized the value of the pianoforte. Attaining a marvelous degree of virtuosity in the use of the keyboard at an early age, he later found this of the greatest advantage in working out his ideas, and, further, in actually trying their effects upon auditors. Thus we find in his first pianoforte sonatas effects which appeared much later in the greater elaboration of his symphonies; thus also is shown the necessary imperfection of any division of his works into distinct periods, since his pianoforte style was so greatly in advance of his orchestral.

=Improvement in the Piano=.—In this connection, it is important to note that Beethoven's resources were greatly increased by the improvements which had been made in piano manufacture. The demand for instruments, created by the growing popularity of the pianoforte, stimulated manufacturers to redoubled energy in perfecting them; and, conversely, the added resources thus developed were an instigation to composers to test their abilities in the invention of new effects. Thus Beethoven was placed in command of a piano of much greater power than Mozart's; and the work of technicians, like Clementi, for whom he had great respect, was already hinting at new and marvelous possibilities.

=Added Sonority and Sustaining Power=.—This strength of construction resulted in greater sonority. Hence we find full chord progressions and rich floods of tone in Beethoven's works, in place of the dainty harmonic accompaniment of former writers. Moreover, the increase in sustaining force, enhanced by the use of the pedal, made possible a sustained legato tone for singing passages, which had formerly to be merely hinted at through shakes and other embellishments. A consequent tone variety made it possible to emphasize a single voice in this way, while the accompanying harmonies could be kept well in the background. Again, this range of tone proved an incentive for long crescendos, from the softest suspicion of sound to an overwhelming tonal climax.

=Increased Compass=.—The added range which the keyboard developed also enhanced such effects, by the chance for brilliancy in the treble, and for profundity in the bass; moreover, Beethoven was quick to make use of the variety of effects caused by _playing in the different registers_; sometimes suggesting in this way the contrast in the orchestra between different groups of instruments, such as the strings and woodwind.

=Structure of Beethoven's Sonatas=.—With such resources at his command, Beethoven was able to give a fuller scope to the Sonata than was formerly possible, filling out each movement, and perfecting it for the expression of an integral part of the general idea, and finally placing it in its proper relationship to the whole. The Sonata Form, as settled by Haydn, was made the point of departure, serving almost invariably as the basis of the first movement, and frequently, in shortened form, for the second, generally

slow, movement. For the third movement, Beethoven at first employed the Minuet, following the custom in the symphonies of Haydn and Mozart; but later this was generally omitted in the pianoforte sonatas, while in the symphonies its time was quickened into that of the dainty, sparkling Scherzo. For the finale, the Rondo form was most frequent; though, in order to give a fuller compass to the thought, a combination of the Rondo and Sonata forms was invented by Beethoven, and used even in his first sonatas. The Rondo form also appeared occasionally in the slow movement. Add that other forms, notably that of the Variation, sometimes supplanted one or the other of these, and we have the structure generally followed by Beethoven.

=Unity of Conception=.—All these movements were associated in an organic unity of conception which made one grow out of another with perfect naturalness. Sometimes, indeed, as in opus 27, a continuity of performance was indicated; always, however, the feeling of dependence of one movement upon another is present; so that the criticism made upon Haydn's symphonies, that a movement of one could be interchanged with a similar movement of any other without perceptible difference, could never be made with regard to Beethoven's works.

=Key Relationship=.—In key relationship, Beethoven struck out from stereotyped paths, frequently using _contrasting keys related to the third of the initial chord_; thus a movement or passage in C major might be followed by any key related to E, the third of the chord of C, such as E or A major or minor. The original key was most widely departed from in the slow movement, where the beauty of contrast was exceptionally noticeable.

=Number of Movements=.—The number of movements which he adopted was at first four, but this afterwards varied considerably, two or three movements prevailing; while in the fantasie-sonatas, and especially in the last five sonatas, an indefinite number of movements, some of them very short, appeared. He explained this discrepancy on the ground that he adapted the number of movements to his thought; and when he felt that he had given complete expression to this, the sonata was brought to a close.

=Development of First Movement Form=.—Of Beethoven's first movements, it may be said that no one has ever spoken with the perfect freedom and naturalness which he displays. Each part of the movement he strengthened and developed; the first section announced two themes, contrasting, but still closely identified; sometimes with a slow introduction to usher them in; the Development was given a contrapuntal treatment, solidified by rich harmonies; the third section was varied by rhythmic or tonal devices, tending to broaden its effect; and, finally, the Coda was sometimes developed to the length of a fourth section, in which reminiscences of material used previously were worked up to a fitting climax.

=Devices for Giving Unity=.—But the most evident characteristic which Beethoven put into this form was that of _Unity_, or _Continuity of idea_. This he accomplished by several means. Of these, the first was by separating the most striking parts of his subjects into short, definite phrases or motives, and by introducing these in every variety of manner throughout the movement, sometimes in a sequence on different degrees of the scale, sometimes by imitation in different voices, again by varying the length of the component notes, and finally by dropping off portions, while the portions remaining keep the idea still before the auditor. Or, some casual phrase, in an unimportant section, will strike his fancy and he will develop it with a wealth of imagery astonishing in its inventiveness.[10]

=Continuity of Various Parts=.—This constant presentment of a thematic idea also serves to bind passages closely together which, in the sonatas of Haydn and Mozart, were separated by definite pauses. Indeed, Beethoven sedulously _avoids a complete cadence_, seeking, by leading the listener eagerly on from one connecting phrase to another, to retain the interest and make it mount up higher and higher, as the effects grow in intensity. So phrases are made to overlap one another, with their boundaries practically eliminated. It has been said that Beethoven tore down the fences which Haydn and Mozart had erected between the various parts of the Sonata Form; and this is proven by the fact that, in the Beethoven sonatas, authorities frequently differ as to where one part ends and another begins, so close and continuous is the bond between them.

=Dramatic Effects in Climaxes=.—This close connection is made a ready element toward the dramatic expression which finds vent in the climaxes, made from culminating tonal effects, where the thematic phrase mounts up step by step, higher and higher, growing breathless by shortened rhythm, until the hearer is brought to the summit of dramatic intensity; and here thunderous arpeggios, mingled together by the use of the pedal, hold him spellbound with their sonorous waves of sound. The supreme passion which Beethoven does not wholly conceal even in his quieter moods appears frequently in strange, agitated rhythms and startling accents thrown upon unexpected notes or in unexpected places. He also used many more marks of expression than his predecessors.

=Freedom in Modulations=.—The boldness of his modulations has already been mentioned; and these appear with the most freedom in the development sections, where tonalities pile upon one another, until the auditor is apparently inextricably involved in a maze of harmonies; from which, naturally as the awakening from a dream, he finds himself transported back to the original key, in which the first theme is taking its course. Beethoven's sense of proportion, however, sees to it that this intricacy of keys is well prepared by the definite tonality of his original subjects, and by the final complete restatement of the original key. His harmonies frequently shocked his contemporaries by their violations of conventional rules; but they have long since been justified by succeeding musicians, who have departed from them to much bolder flights.

=Program Music=.—It has been said that Beethoven furnishes examples of the program style—that is, the depicting of definite ideas through music. We have already found a tendency of this sort among the early French clavier composers—Rameau, the Couperins and others of their school; also in some of the German writers, like Pachelbel and Kuhnau. Viewed in relation to these early composers, Beethoven's work seems to have little in common, since his nearest approach to program music was in attaching to some of his works certain moods, inspired by events or scenes. Thus he gives the name "Pathétique" to the sonata, opus 13, "Appassionata" to opus 57, "Les Adieux" to opus 81; while we have the "Pastoral" symphony, depicting the mood inspired by country scenes, and the "Eroica," showing the mood arising from the contemplation of a hero's career.

=Pianoforte Concertos=.—The same characteristics which are noted in his pianoforte sonatas appeared, developed still further, in his larger works, such as his symphonies and piano concertos. The latter, five in number, display the resources of the virtuosity of Beethoven's day, and yet keep this always subordinated to the inspired musical sentiment, with which the orchestra nobly accords. The last two of these, belonging to the maturity of his genius, amply display the powers of genuine expression.

=Variations=.—Of numerous other piano compositions, the sets of Variations are prominent. He was fond of taking some short and simply constructed musical thought, sometimes from some song or opera, and treating it in every variety of manner that his fertile genius could suggest. Such compositions, while generally playful in mood, have the finish which Beethoven never failed to give to his work.

=Beethoven's Accuracy in Writing=.—It is this seriousness toward his art which most fully accentuates the real underlying drift of his nature. In the midst of his untidy ménage, when confusion of material goods reigned about him, Beethoven nevertheless treated each work which flowed from his pen with the most careful and critical revision, never allowing it to go out until he had absolutely fixed each note in its proper place. Where his art was involved, his usually irritable nature acquired a fund of patience; so that sometimes whole scores were rewritten, until he arrived at accurate expression; and, when that point was reached, his fiat was irrevocable. It is thus a satisfaction to note that he has not left us the erratic wanderings of an eccentric mind; but the completed and matured product of a genius, speaking with authority and precision.

QUESTIONS.

Contrast Bach and Beethoven.

Characterize Beethoven's three periods.

What was the greatest means of expression in Beethoven?

What was the value of his work for the piano in relation to the orchestra?

What was the effect of the improvements in the piano of Beethoven's time over that of Mozart?

Give a statement of the Sonata as constructed by Beethoven.

What changes did he introduce: Key relationship? Number of movements?

What qualities are found in his first movement form?

How does he secure great unity and continuity of idea?

How does he secure dramatic expression?

Where does he introduce bold modulations? With what effect?

What use did Beethoven make of the program idea?

Tell about his Concertos. His Variations.

LESSON XXXIV.

THE VIOLIN AND ITS MAKERS.

=Change from the Viol to the Violin=.—The reader who has studied the principles of construction and playing of the old string instruments, as explained in Lesson XV, or examined them in museums, will not have failed to note that they were complicated and limited in technic. The members of this family were large and cumbersome, troublesome to handle and not particularly graceful or pleasing to the eye; the position in which the player was forced to hold them was difficult to maintain and not conducive to a rapid, facile technic. Now, the direction of a perfected art is always toward simplicity; the various members of the viol family were to yield place to a new instrument, a modification of the original type, and one that possessed some striking and valuable advantages over the viol. Another element that aided in the change from the viol was the efforts of composers to produce a distinctive instrumental music, a style which demanded an instrument with a higher range than the viols, corresponding to the highest female voice. Still another element to be considered was the stir in intellectual, social, political and commercial life which was evident everywhere, the product of the Renaissance. Music was influenced by this spirit; composers were seeking new forms in which to express their thoughts and were calling for new and better media for presenting them to others. As composers gained in breadth and power of conception, instruments were improved even beyond their demands; the increase in resources stimulated, in turn, the composers. At this period music was on the threshold of a splendid activity in instrumental lines, the reign of the old choral music and the contrapuntal composer was being challenged, and the way prepared for Haydn, Mozart and Beethoven.

=Beginning of the Violin=.—With regard to the violin, as in other beginnings, there is disagreement; the strongest claims are set forth for France and Italy, with German historians by no means lax in attributing the first instruments to one of their own countrymen. We give the following facts which seem to divide the honors: In the scores of Italian works of the 16th century, a part may be found for what is called the _piccolo violino alla francese_ (little French viol), a fact which would argue that an instrument of this kind, perhaps most commonly used in France, had been known for some time. The oldest known instrument of the violin type is one which bears the date 1449, and is signed Jean Kerlin, a Breton luthier (lute maker, a term applied also to violin makers), whose name is also given as Kerlino, living in Brescia, Italy, in the middle of the 15th century. About the same time there lived in Bologna, Padua and Venice, members of a celebrated lute-making family, named Duiffoprugcar, Italian equivalent for the German name, Tieffenbrucker, for the family came from the Italian Tyrol. The most celebrated member of this family was Gasparo Duiffoprugcar (Casper Tieffenbrucker), who was born about 1469, lived in Bologna until 1515, when he went to Paris. Later he removed to Lyons, where he spent the rest of his life. Six instruments having violin characteristics (high, not sloping shoulders, deeper curves in the waist and better-defined _f_ holes) are attributed to him, bearing dates of 1510, 1511, 1515 and 1517.

=Early Italian Makers=.—The next name is that of Gasparo di Salo, founder of the Brescian school of violin-making, who was born at a little village called Salo, on Lake Garda; hence his name. His model varied, sometimes it was high, at other times flat; as his instruments produced a full, sonorous tone, the model was revived in later years by Joseph Guarnerius. His tenors and double-basses are considered his finest work, his violins being a trifle small. The favorite double bass of Dragonetti, the famous contrabassist, was by di Salo; Ole Bull frequently played on a di Salo violin in his concerts. The greatest successor of di Salo was

his pupil, =Giovanni Paolo Maggini= (1590-1640), whose violins are highly prized. They are characterized by a brown varnish and a double purfling.

=The Cremona School=.—With the public the name Cremona is indissolubly connected with violin-making. In the 16th century this city was a famous art centre, rivaling Bologna in music and painting. The first great maker and founder of the Cremona school was Andrea (Andrew) Amati, born about 1520 and died 1577 or 1580.[11] He used mostly a small pattern, top and back high, the varnish amber in color. A number of his instruments furnished for the Chapel Royal of Charles IX were known to have been in Versailles prior to the French Revolution. The Amati style was continued by Andrea's two sons, Antonio (Anthony) and Hieronymus (Geronimo or Jerome) Amati. The former is said to have lived 1550-1638, the latter 1551-1635. They worked conjointly, although the latter made some experiments with a larger model than the usual Amati.

=Nicolo Amati=.—The greatest of the Amati family and the one whose instruments are still highly prized was =Nicolo (Nicolaus) Amati= (1596-1684), the son of Geronimo. He forms one of the great triumvirate of violin-making, Amati, Guarnerius and Stradivarius. At first he followed the small form adopted by his father and his uncle, although he improved on the workmanship. But about 1625, no doubt as the result of an experiment, he began to use a slightly larger pattern which is known to connoisseurs as the "Grand Amati." These instruments represent his best work and command a high price. The Amati tone is sweet, mellow yet somewhat delicate, although remarkable in purity; the instruments are unsuited to orchestral work, although admirable in chamber music, particularly of the old style. The varnish is yellowish or amber colored.

=Joseph Guarnerius=.—In our study of the piano we noted how the small, weak tone of the clavichord and harpsichord gave way before the fuller toned, sonorous pianoforte, which, with its greater possibilities, came into use at a time when composers were seeking for means to give increased breadth and power to the reproduction of their music. It would have been unfortunate for instrumental music if the small though sweet tone of the Amati violin had been accepted as the ideal. We could not have had the surging tumult of Beethoven's "Eroica" symphony, the great dramatic pictures of Wagner with the Amati to lay on the colors. More tone, more sonorousness, more virile singing was needed. One of the men to place in the hands of executants the instrument to work out the conceptions of the great composers was =Giuseppe Guarneri= or, as he is generally called, Joseph Guarnerius del Gesu. He was born at Cremona, 1683, and belonged to a family of lute and violin makers. He has been credited with having been a pupil of Stradivari, yet his instruments show no trace of that maker's influence. He seems to have been impressed with the tone-producing qualities of the di Salo violins, for his best instruments have something of their bold, vigorous style. He was an experimenter, ever seeking, it would seem, for the means of producing big, sonorous tone, and changed his model frequently, for which reason his instruments vary much in value. His work was not so highly favored by connoisseurs until Paganini showed the value of a Guarnerius from the standpoint of tone. His best instruments are now greatly admired and, because so few in good condition are known, command a high price. The date of Guarnerius' death is not known. Others of the Guarnerius family who lived and worked at Cremona were Andreas Guarnerius, uncle to Giuseppe, his son also called Joseph and known as "_filius Andreæ_" (Son of Andreas) to distinguish him from his cousin, Joseph del Gesu, another son Peter, "of Cremona," and a son of Joseph _filius Andreæ_, known as Peter of Venice.

=Antonius Stradivarius=.—The greatest of violin-makers who united in his instruments the brilliant and powerful tone of di Salo and the Brescian school and the purity and finish of the Amati was =Antonius Stradivarius= (Antonio Stradivari is the Italian form), born in 1644, one year after the death of Monteverde, and died in 1737, five years after the birth of Haydn, a period of nearly a century in which a most significant development took place in music. He was apprenticed to Nicolo Amati, and the instruments of his early years are faithful copies of that master's work; but as he grew in years and experience he improved on the Amati model, every change tending to produce a more powerful and resonant tone. The differences that strike the eye most strongly are the larger proportions, the flatter arch of the top, and the shape of the sound holes. In his earlier instruments he used a yellowish varnish; after 1684, one of a reddish tint. Stradivarius also fixed the form and adjustment of the bridge. He left two sons, Francesco and Omoboni, who finished some of their father's instruments after his death. They both died five or six years later. Pupils of Stradivarius who made excellent instruments were =Carlo Bergonzi= (1712-1750), =Lorenzo Guadagnini= (1695-1740) and his son =Johannes Baptista Guadagnini= (1750-1785) and =Alessandro Gagliano=.

=Other Makers=.—Germany's contribution to violin-making dates from =Jakob Stainer=, of Absam in Tyrol (1621-1683). Tradition has it that he learned his art at Cremona; if so, his work shows no influence of the Amati; his model is different, somewhat broader and shorter, the arch of the belly is greater, and the sound holes are set differently; the varnish varies from a brown to an amber color; the tone is sweet and quick to respond, but lacks intensity. A follower of Stainer was =Ægidius Klotz= (1653-1743), many of whose instruments were sold as of Stainer's make. France contributed no makers of great renown. The names of importance are

=Nicholas Lupot= (1758-1824), a follower of Stradivarius, and =J. B. Vuillaume= (1799-1875). In England the most distinguished names are =Richard Duke= and =Benjamin Banks= (1727-1795).

=The Violin Bow=.—A few words must be said in regard to the bow, the means for producing tone from the violin strings. In its earliest form it was simply a bow with a stretched string. Hair came into use, to replace the string, about the 13th century, and the bow lost its original shape, becoming straight for nearly its entire length, curving downward at the point. Corelli used a bow of this shape. Tartini's bow had the same shape, but was made longer. At the end of the 18th century, =François Tourte= (1747-1835), a Paris bow-maker, lengthened the bow still more, and bent it slightly inward, giving it the form familiar to us today. Viotti was the first great player to use this style of bow, and is credited with a share in perfecting it. It is no exaggeration to say that upon Tourte's improvements to the bow rests the whole fabric of modern violin-playing, with its wonderful variety of execution and consequent nuances in expression.

=The Viola and the Violoncello=.—Two other instruments of the violin type are in use, the Viola, the _tenor_ violin, and the Violoncello, the _bass_ violin; both these instruments shared in the development of the violin, and were made by the great makers, Amati, Guarnerius and Stradivarius. The Contra-bass, the bass-viol, as it is often called, while it is used to furnish the bass to the string orchestra, is a member of the viol family, having the special characteristics, sloping shoulders and flat back. Instruments were made on the violin pattern, but given up as less satisfactory than the viol type.

The impetus given to instrumental composition by the perfecting of the instruments of the string group stimulated makers to work for improvement in those belonging to the family of wind instruments, flutes, oboes, clarinets, horns, harps, etc., thus offering the means to reproduce for hearers the great conceptions of the tone-masters.

QUESTIONS.

Why did the Viol type yield to the Violin?

Who is credited with being the originator of the Violin type?

Give the names of the early Italian makers.

What noted family of violin makers started the fame of Cremona?

What was the model used by the Amati family?

What improvements did Joseph Guarnerius make?

What was Stradivarius' contribution?

Who was the greatest German maker? Name French and English makers.

Compare the great makers of violins and their work.

The author suggests that a violin, viola, 'cello and double bass and the respective bows be exhibited to the class and examined, the descriptions as given in the reference works to be compared with the instruments. The catalogue of the Metropolitan Museum of Art, New York City, contains some fine illustrations for the use of students, as well as descriptions. A copy of this should be in every teacher's library. It can be secured for a small amount by addressing the Museum as above.

LESSON XXXV.

VIOLIN PLAYING AND VIOLIN MUSIC.

=Reciprocal Influences of Instruments and Composition=.—The development of the violin, of violin playing and violin music, in a certain sense shows reciprocal influences, and went hand in hand. This was the more certain because the composers who wrote for the instrument were also players, in almost every instance the virtuosi of their times. During the polyphonic period, composers were singers or organists; during the period when the violin dominated instrumental composition, composers in that form were usually violinists. In the next period, when the pianoforte was coming to the front, the representative composers were clavier composers. And since then with but few exceptions the great composers have also been pianists.

=Earliest Violin Compositions=.—In the music of the viol period no demands were made upon the instrumental player except that he should double the voice part, which was simple, viewed from the standpoint of modern violin playing. Even later when music was written for quartets of viols the parts were vocal in character and did not exceed voices in range. The earliest known solo composition was published in 1620, by Marini. It demands but little from the executant. The next work of importance was in 1627, when Carlo Farina, an Italian living at Dresden, published a collection of pieces which show quite an advance technically, including variety of bowing, double stopping and chords. The names applied to violin compositions were: _Sonate_, _Canzone_ and _Sinfonia_, the principle of the first named being an alternation of slow and quick movements. About 1650 the term Sonata comes into general use, and a further distinction is made between _Sonata da Chiesa_ (church sonata) and _Sonata da Camera_ (chamber sonata), the former consisting of three or four movements varying in tempo, the latter being really a suite of dances, with slow and quick movements in alternation. The Church, always ready to make use of the fine arts, soon discovered the capabilities of the violin and its music, and adopted it as one of its musical forces, not merely for assisting in accompaniments but for independent performances. As a result of this patronage, the violin sonata, the only form of serious composition for the instrument, took on the severer character of the church sonata, giving an impulse toward the establishment of sonata form.

=Composers of the 17th Century=.—Among those who prepared the way for the great ones to follow was =Giovanni Battista Vitali= (1644-1692), who shows in his chamber sonatas the tendency to adopt the form of the church sonata. His name is best known in violin literature by a Chaconne with variations, which makes no inconsiderable demands on the technic of a player, and must have marked him out as a conspicuous player in his own time. This is a worthy forerunner of Bach’s great work in a similar form. In Germany the significant name is =Heinrich Biber= (1644-1704), who had a highly developed technic for that period, for his works carry the player up to the sixth position and introduce difficult double stopping and arpeggios. The next name to be noticed is =Giuseppe Torelli= (1660-1708), who lived many years in Bologna as leader of a church orchestra. He is credited with having been the first to apply the principles of construction as shown in the church sonata to concerted music, which later developed into the Concerto.

[Illustration: ARCANGELO CORELLI.]

=Corelli=.—In any great movement one man seems to sum up the best of the work of his predecessors. The name associated with putting violin music and playing on a firm foundation is that of =Arcangelo Corelli= (1653-1713), eminent both as composer and player. He was a contemporary of Guarnerius and Stradivarius, who brought the instrument to perfection. Of Corelli’s early life little is known. He traveled in France and was also in Munich for some years. In 1681 he returned to Italy, making his home at Rome. As a teacher, he acquired great fame and pupils came to him from all parts of Europe. The most eminent violinists who were under his instruction were Geminiani, Locatelli, Somis, Baptiste, and Castrucci. Corelli did not invent new forms of composition or of technic—in the latter respect he did not equal certain of his contemporaries—he was a reformer rather than an innovator. He had, however, a keen sense for effects that were specially suited to the instrument, and his conservatism put the art of playing the violin on a solid basis upon which others were able to add newer and more difficult technic. His works included forty-eight three-part sonatas for various combinations, twelve two-part sonatas for violin and cembalo, nine for two violins and cembalo, and six concertos for two violins and ’cello with a quartet accompaniment. The violin being so preëminently a singing, a melody instrument, it is singular that Corelli and his contemporaries did not grasp the principle of using clearly defined melodic themes. This fact shows that the influence of the church sonata and its rejection of a formal tune as unsuited to serious art was still strong. Therefore, while Corelli’s works do not show themes such as are characteristic of the next period of the sonata, his construction is logical and his handling of his form-material is concise and clear. The student of Form in music will find the germs of sonata-form in Corelli’s works.

=Corelli’s Pupils=.—Among Corelli’s pupils must be mentioned =Francesco Geminiani= (1680-1762), who spent part of his life in England. He published the first work of a pedagogic character, a “Method for Violin Playing,” in London, in 1740. He also

recommended holding the violin on the left side instead of on the right, as was customary in his time. =Pietro Locatelli= (1693-1764) greatly influenced the development of violin technic. =Giovanni Battista Somis= (1676-1763) lived at Turin, was the teacher of Pugnani, the instructor of Viotti. =Antonio Vivaldi= (1675-1743) devoted himself to virtuosity and influenced the Concerto from this point. He was fertile and ingenious in making new combinations and devising new effects. J. S. Bach arranged his works, sixteen for the clavier, four for the organ, and one as a concerto for four claviers and a quartet of stringed instruments. Still another name is to be mentioned, that of =Francesco Maria Veracini= (1685-1750), who greatly influenced Tartini by his playing. He was a player full of temperament, which made his playing powerfully expressive. His sonatas are bold in harmonic and melodic treatment, and well constructed. Their technical difficulty is considerable. (His lifetime coincides with Bach.)

[Illustration: GIUSEPPE TARTINI.]

=Giuseppe Tartini= (1692-1770) is one of the commanding figures of musical history. He was intended for the profession of law by his parents but, fortunately for music, did not fall in with the plan. A hasty marriage with the niece of an archbishop brought him into trouble, and he fled to a monastery, where he spent two years, devoting the greater part of his time to musical studies. At the end of this time he was allowed to rejoin his wife, and went to Venice, where he learned to know Veracini, with whom he studied to correct the faults he had acquired through pursuing his studies undirected. Again he went into retirement and gave himself up to the study of violin technic. Among other things he made some improvements in the bow, increasing the range of effects. His contemporaries ascribe to him “a fine tone, unlimited command of fingerboard and bow, perfect intonation in double stops, a most brilliant trill and double trill as well, which he could execute equally well with all fingers.” His celebrated composition “_Il Trillo del Diavolo_” (“The Devil’s Trill”) shows his skill in embellishments. A technical work “_Arte dell’ Arco_” (“The Art of Bowing”) gives a clear idea of his method in that branch of the violinist’s art. In his compositions he shows advance on Corelli and Vivaldi, for his melody is broader, his phrases more developed and clearer, his harmonies richer and better contrasted, with many passages of a strongly emotional character. He wrote a great number of pieces, sonatas and concertos. In addition to his work as player and composer, Tartini devoted himself to teaching. His school at Padua was the Mecca of violinists from all Europe. In those days there were no instruction books; Tartini’s pupils looked to him for everything, and his character as a teacher can be learned in a letter addressed by him to a pupil.[12] Tartini’s contribution to music also includes work of a theoretical character. He discovered the so-called combinational sound, by which is meant the sounding of a third sound when two tones are sounded together.[13] He published a treatise on the subject. Two pupils of Tartini’s who deserve mention are =Pietro Nardini= (1722-1793) and =Gaetano Pugnani= (1726-1803), who was also a pupil of Somis, thus uniting in himself the teachings of the two great masters, Tartini and Corelli, which he transmitted to later generations through his great pupil, Viotti.

With Tartini the violin sonata of the old type lost its place, being succeeded by the sonata for the piano which was being developed by composers, giving rise to a form that was later to be the basis of a new sonata for violin and piano in which each instrument filled an equal place. In the earlier days the tone of the clavichord and harpsichord, weak and thin, was not suited save for accompanying the full-toned brilliantly effective violin; but after Tartini’s time the instrument gained in power and sonorousness and formed a worthy helpmeet for the violin.

[Illustration: GIOVANNI BATTISTA VIOTTI.]

=Violin playing in France= was largely influenced by Italian players. Lully, the opera composer, was a violinist, but the Italian school had not developed when, as a lad, he left his native country. The Corelli principles were carried to France by =Leclair= (1687-1764), who received his training from Somis, a pupil of Corelli. His treatment of the bow showed the lightness and agility that later became distinctive of the French school. =Pierre Gaviniés= (1726-1800) lent strength to the establishment of an independent French school of playing. He is best known today by a set of difficult studies. =Giovanni Battista Viotti= (1753-1824), an Italian by birth, greatly influenced violin playing in his day. As a lad of seventeen he traveled through Europe with Pugnani, his teacher, winning great success. Later he located in Paris, teaching and composing, giving regularly private performances at which he brought out his concertos. His themes have a marked singing character, and all his writing is eminently suited to the instrument. In his concertos he used the elaborated sonata-form as developed by Haydn, Mozart and Beethoven, and in his accompaniments draws fully on the resources of the orchestra. His works include a fine set of duets for two violins. His most eminent pupils were =Pierre Rode= (1774-1830) and =Pierre Marie François de Sales Baillot= (1771-1842) who with =Rodolphe Kreutzer= (1766-1831) were teachers in the Paris Conservatoire, for which they prepared the famous “Méthode de Violin.” Rode and Kreutzer are famous in violin literature for their studies for advanced players. Beethoven dedicated his great sonata for piano and violin, Op. 47, to Kreutzer, for which reason it is known by the latter’s name. In connection with the educational writers just mentioned, =Federigo Fiorillo=, born 1753, in Germany, of Italian parents, is to be noted. His thirty-six etudes or caprices rank with the works of Rode and

Kreutzer. =Antonio Lolli= (1730-1802) was a virtuoso and nothing else. His execution was marvelous, and he was, in many respects, a forerunner of Paganini.

=Violin playing in Germany= had its source and inspiration in the concert tours made in that country by the great Italian virtuosi, a number of whom lived for periods of some length at the courts of Berlin, Dresden, Mannheim and other capitals, where they trained pupils for the various ducal orchestras. The orchestra at Mannheim was the most famous for its work and sent out a number of fine players and musicians. Space does not permit the mention of these men. The first great name in the violin world of Germany is =Ludwig Spohr= (1784-1859), who was also one of the great composers of his time, his activity leading him into the domain of the oratorio and opera as well as orchestra and instrumental music. (His principal teacher was =Franz Eck= (1774-1804), who belonged to the Mannheim school.) Later he had opportunity to hear Rode, by whose playing he was much impressed. He spent some years in concertizing, and in 1822 located at Cassel as the director of the orchestra there. Here he taught many noted pupils, the best known being Ferdinand David. While Spohr was a great player and a great teacher, he influenced modern violin playing more by his compositions. Some of his concertos still figure in the violinist's repertoire and his duos and concertantes for two violins and for violin and viola are unsurpassed by any compositions in that style. In 1831, he published his "Violin School," which was a standard work for many years. The direct successor of Spohr was =Ferdinand David= (1810-1873), a great player and a great teacher who was associated with Mendelssohn in the founding of the famous Leipzig Conservatorium. From this institution David's pupils went over all Europe into positions of responsibility and reputation. His greatest pupil was =August Wilhelmj= (b. 1845). After David's death supremacy in the field of violin playing gradually fell away from Leipzig and centred in Berlin around Joseph Joachim, the Nestor of the present-day[14] violin world.

[Illustration: LUDWIG SPOHR.]

=The Vienna School=.—The southern Germans had certain characteristics wherein they differed from their northern kin; they were in closer touch with Italy and were also influenced by their Hungarian neighbors. In Beethoven's time considerable attention was given by Viennese violinists to chamber-music. Four names are prominent: =Karl Dittersdorf= (1739-1799), =Anton Wranitzky= (1756-1808), =Joseph Mayseder= (1789-1863) and =Joseph Bœhm= (1795-1876), the latter being the teacher of a number of famous violinists, =Hellmesberger=, =Dont=, =Remenyi=, =Ernst= and =Joseph Joachim= (b. 1831), the latter, representing the solid, classical style of his teacher, joined to a mastery of the technic of his instrument that enabled him to win and maintain the highest rank as virtuoso, quartet player and composer for his instrument. Up to the time of his death, August 15, 1907, he was director of the Royal High School of Music in Berlin. He was the teacher of hundreds of players, including many celebrated artists of the present day.

[Illustration: JOSEPH JOACHIM.]

[Illustration: NICOLO PAGANINI.]

=Paganini=.—The most unique, most startling figure in music belongs to the violin, a law unto himself in his playing, one for whom the violin seemed to have been perfected long years before by Guarnerius and Stradivarius and one who seemed to have been made for the violin, the hero of fictions innumerable, to whom was attributed in his day all manner of occult power. This mysterious king of the violin was =Nicolo Paganini=, born in Genoa, February 18, 1782, died May 27, 1840. Never strong in body, in his early youth he gave himself up to dissipation to such an extent that he undermined his constitution, and passed through the world as a spectre rather than as a man. Paganini was self-developed, he belonged to no school and he founded none, yet so great was his command of the technic of the violin and the bow, that no other player so profoundly influenced contemporaries and successors on the matter of virtuosity. He taught but one pupil, =Camille Sivori= (1815-1894). Paganini greatly influenced the younger French violinists of his day, among whom may be mentioned =Alard= and =Dancla=. After these men come =Charles de Bériot= (1802-1870), who represents the Belgian School, his pupil =Henri Vieuxtemps= (1820-1881) and third generation in the line of pupilage, =Eugen Ysaye= (b. 1858). Others who belong to the Belgian School are =Massart= (teacher of =Wieniawski=, =Kreisler= and others), =Léonard= (teacher of =César Thomson=, =Marsick=, =Musin=, =Marteau=, etc.). At the present time the centre of interest in the violin world has shifted to Prague, where =Ottokar Šev■ík= has sent out young violinists of the Slav race who display the most astonishing technical mastery.

Hart.—The Violin and its Music.

QUESTIONS.

What was the form of early violin music?

What difference was there in sonatas?

What were Corelli's contributions to music?

What were Tartini's contributions to music?

Trace the connection between the French and Italian schools.

Trace the connection between the German and the Italian schools.

Trace the connection between the Vienna and the Italian schools.

What composers contributed most largely to the educational side of violin music?

Prepare a short sketch of Paganini.

LESSON XXXVI.

THE ORCHESTRA AND ABSOLUTE MUSIC.

=The Orchestra as a Means of Expression=.—The most perfect means for expression in music is presented by the orchestra, which, in its complete form as shown today, is the result of a long development in many directions. To give us this magnificent mass-instrument required a sifting of the various instruments and the choice of those that offered the best possibilities, a perfecting of these instruments, a shaping of systems of playing them, of technic that should draw out all possible effects, and an understanding, on the part of composers, of the nature and demands of absolute music and how best to shape their conceptions in accordance with these demands. The orchestra and its music, therefore, represents the extreme height of man's work in music, for even when choral forces are joined to the orchestra, the instrumental idea dominates, as, for example, in the Ninth Symphony of Beethoven, in which the chorus is simply a _vocal band_ added to the other groups. The orchestra is a great means for musical expression because it offers to the composer the maximum of resources. In modern days, when the esthetic principle of Unity in Variety receives the most elastic interpretation due to the demand for the greatest possible contrasts in tone-color, power and in nuances, all, however, intended to exhibit and illumine the themes invented by the composer in their various transformations, in these days the orchestra is truly the most complete art-means known.

=Groups in the Orchestra=.—The orchestra is composed of groups of instruments allied by similarity of construction. The usual classification is into three main groups, =strings=, (bowed instruments), =wind= and =percussion= instruments. In the former are included the violins, viola, violoncello and double or contra-bass; =wind= instruments subordinate into =wood wind= and =brass=, the former include instruments of the flute, oboe, bassoon and clarinet families, the latter horns, trumpets, trombones, tuba or other bass instruments; the =percussion= includes kettle drums, other drums, triangles, cymbals, etc.; the =harp=, while a stringed instrument, is not included in that class. These instruments offer a great variety of effects, singly and in many possible combinations, in the peculiar effects possible by variety in playing, which in bowed instruments is considerable, and particularly by contrast with each other. While the orchestra today is in a highly developed condition, composers are seeking to extend the limits of their art by the use of more elaborate and subtle forms; so that we cannot in any wise predict the course and limits of absolute music with the almost unlimited resources at its disposal in the modern orchestra.

=Purpose in Combination=.—When we consider the orchestra as a combination of instruments we must bear in mind that this combination is the result of a definite purpose to produce music independent of restrictions such as were shown to have existed in the days of the domination of the Church. The composers of the early polyphonic period and up to the 17th century bent their efforts to the composition of choral music which was sung for many years without instrumental support. When later the organ, and still

later, viols and other instruments were drafted into the service of church music, the accompaniments were not independent of the voice, but merely doubled the various parts. Composers thought in _terms of voices_ and their limitations, _not in_ the greater range and endurance of _instruments_. Then, too, the instruments were crude and their tone lacked distinctiveness as well as the comparative sweetness and purity of the vocal music of that day. Combinations of instruments existed in the Middle Ages, but not according to a system, and were due to the executants who assembled them rather than to the demand for them in the works of composers. It was in the attempts at light dramatic music that preceded the establishment of the opera that instruments were grouped together, showing a great weakness, from our point of view, in stringed instruments played with the bow, and a corresponding preponderance of brass.

=Influence of the Opera=.—The first composers of opera and oratorio gave instrumental support to the singers, although it was very meager. Yet the opera gave the help of that great principle of invention, necessity, and composers began to experiment with various combinations of instruments to secure a more adequate accompaniment for the voice as well as to heighten the effects demanded by the drama. =Monteverde=, an independent thinker and innovator, marked out lines in which efforts should be made by successors. He studied the _characteristic effects of_ the various _groups_ and made use of them as he felt them. His orchestra for “Orfeo” (1608) was made up of two harpsichords, ten tenor viols, two bass viols, two “little French violins,” one double harp, two organs of wood, one regal, two viole de gamba, two large guitars, two cornets, two trombones, three trumpets with mutes, one octave flute, one clarion. The most significant item is found in the “little French violins,” which presages the appearance of the instrument which was, a century later, to be recognized as the backbone of the orchestra. Among the distinctive instrumental effects which Monteverde introduced was the =tremolo= for bowed string instruments as well as the =pizzicato=. In looking over the instruments of Monteverde’s orchestra we will note but _one_ wood wind, the flute. This shows that composers, doubtless through the military use of brass and drums, had accepted the latter as means for special effects. Instruments of the _wood wind_ type were still too _crude_ to be admitted. =Alessandro Scarlatti=, who did so much for the opera from the side of form and content, also contributed to the development of orchestral music. He evidently perceived the importance of having a nucleus around which to build his harmonies, a group of instruments which should furnish a firm support and which could blend the various tone qualities. With the intuition of genius he selected the =string tone= for this purpose, and in this he was greatly aided by the fact that the Amati family, and their successors, Guarnerius and Stradivarius, had already perfected the violin, although the great players were yet to come. Scarlatti wrote in four parts for the string instruments, the treble part to the first violin, the alto to the second, the tenor part to the viola, which previously had often played in unison with the double bass, while the bass part was taken by ’cellos and basses. He also added =oboes= and =bassoons= to the strings and brass. Lully in France used an orchestra similar to that adopted by Scarlatti. The =kettle-drums= now come into use. The works of Corelli and his violinist successors, which showed the possibility of writing for strings, undoubtedly influenced orchestral writing.

=Bach and Handel=.—We now come to the period of Bach and Handel, each distinct in methods, the latter the more immediately influential in the development of the orchestra, the former’s principles of writing in the =polyphonic style= not being taken up until after years by Wagner and more recently by the extreme modern composers with their free polyphony. In a Bach score each instrument had an independent part to sing, and was treated from a musical standpoint, whereas the tendency of other composers was to seek figures and passages which should be characteristic of the instrument, the standpoint of effect. This particularly applies to the wind instruments. =Handel’s= idea seemed to be the building up of great =mass effects=, his style partook of the =harmonic= rather than the polyphonic. He used all the important instruments found in the modern orchestra except the _clarinet_, although the proportion of the wind instruments to the strings is greater, due to the relatively inferior power of these instruments in Handel’s time.

=Haydn and Mozart=.—From Handel we pass to the first of his three great successors, =Haydn=, who has been called the “father of the symphony,” who determined, in fact, the course of orchestral development. And we should not overlook the fact before-mentioned, namely, that the professional violinists, most of whom were also directors of orchestras in the pay of great princes, were testing the capacities and resources of the instruments used. In the period which Haydn represents, the _proportions of the instruments_ in the orchestra were definitely _fixed_ and the size of the string band became relatively greater, the _’cello_ coming in to greater prominence in its use as a _melody instrument_. Haydn’s last symphony, written in 1795, calls for two flutes, two oboes, two clarinets, two bassoons, two kettle drums, and the usual string band. This was the combination which Haydn selected as the most useful and effective, as the result of his experience as a conductor for many years. It was to =Mozart= that the introduction of the =clarinet= into the orchestra is due, for Haydn did not employ this instrument in his earlier works. The clarinet began to take an effective form about the end of the 17th century, yet it was not until the 19th century that it received the improvements that now make it one of the most useful instruments in the orchestra, with a wonderfully facile technic and correct intonation. The greatest of these changes was the application, to the clarinet, of the system of keys and fingering invented by

=Theobald Boehm= (1794-1881) for the flute. In addition to showing the value of the clarinet as an instrument, Mozart pointed the way to some uses of the =trombone=. His E-flat Symphony is scored for one flute, two clarinets, two bassoons, two horns, two trumpets, tympani and strings; in the score of the “Jupiter” symphony, the clarinet does not appear.

=Beethoven= established the orchestra as “the composer’s instrument.” He added but little to the instruments used but he took the resources established by his predecessors and demonstrated what could be done with them. Every group of instruments was used with more detail and to produce characteristic effects both separately and in combination. In his first and second symphonies he uses the same orchestra: two flutes, two oboes, two clarinets, two bassoons, two horns, two trumpets, tympani and strings; in the “Eroica,” a third horn part is added; the fourth has the same orchestra as the first two, except that one flute is dropped; the fifth calls for piccolo, two flutes, two oboes, two clarinets, two bassoons, contra-bassoon, two horns, two trumpets, three trombones, tympani and strings; in the sixth he uses the same orchestra as in the fifth, except that he drops the contra-bassoon and one trombone; in the seventh and eighth the orchestra is the same as in his first and second symphonies. In the ninth (Choral Symphony) he calls for a larger orchestra: piccolo, two flutes, two oboes, two clarinets, two bassoons, contra-bassoon, four horns, two trumpets, three trombones, tympani, triangle, cymbals, bass drum and strings. It will be noted that Beethoven does _not use the harp_. It was not until 1820, seven years before Beethoven’s death, that Erard invented the double-action harp, an effective and a playable instrument.

=Berlioz, Wagner and Richard Strauss=.—The composer who first made an exhaustive study of orchestral instruments, their distinctive qualities, separately and in combinations, was =Berlioz=, who gave to the world his knowledge in his “Treatise on Instrumentation,” published in 1844. Berlioz gave to every one of his works a more or less distinctive quality by varying the composition of his orchestra instead of using the conventional combinations. He made frequent use of the harp, bass clarinet, English horn, bass tuba, besides other less frequently used instruments. He very much enlarged the scope of orchestral music by the new effects he devised. =Richard Wagner=, in his great music dramas, makes use of many new means of dramatic musical effects, introducing new instruments, enlarging the various families, dividing the strings into eight parts, increasing the number of brass instruments, giving to his scores a richness of power and a sonorous quality unknown before his time. =Richard Strauss= is, today, the greatest master of the technic of orchestral writing. His tone-poems make greater demands on the resources of the instruments and contain effects beyond those of Wagner.

[Illustration: HECTOR BERLIOZ.]

=Hector Berlioz= (1803-1869) was the son of a French physician, who designed him for his own profession. But the lad’s bent for music was so strong that when sent to Paris to prepare for a medical degree, he spent most of his time in going to the opera and in studying the scores of the masters. Much against the will of his parents, he determined to give up medicine and entered the _Conservatoire_. His early musical training had been far from thorough and his career was at first not successful. This added to his father’s displeasure, and he finally withdrew all support from his son, who, rather than abandon his art, struggled with the most crushing poverty until a violent illness brought on by privation reconciled his parents to his choice of a profession. After several unsuccessful attempts, he gained the great Roman Prize, which entitled him to a period of study in Italy and Germany at the cost of the State, but throughout his life he battled at home with adverse and discouraging conditions, artistic and domestic. Until after his death his works never received the recognition gladly paid them in foreign countries, where he made frequent tours for the purpose of producing them. His demand for exceptional means of performance, based upon their large scope and previously unheard-of effects, was ridiculed in France, where they were also considered dissonant and bombastic; he encountered jealousy and intrigue at every turn and bore them, too, in no patient spirit.

=His Important Works=.—As a winner of the Roman Prize, however, he had a claim on the State. Thus his great “Te Deum,” written for three choruses, soli, and orchestra, was one of several commissions from the Government and was composed for the opening of the Exposition of 1855. Another similar colossal work is his “Requiem,” with its four small orchestras of brass stationed at the corners of the principal orchestra. These cross and re-cross with thrilling effect, simulating the blowing of the last trump. His most popular and widely-known work, “The Damnation of Faust,” a dramatic cantata now frequently heard in this country and in Europe, failed to awaken the slightest interest at its first performance in 1846 and involved the composer heavily in debt. His enthusiasm for Shakespeare led to the composition of what some consider his most important work, “Romeo and Juliet,” a symphony for orchestra, solo voices and chorus. Berlioz’ genius was essentially instrumental and symphonic in character; hence, though he composed a number of operas, none was successful. Indeed, the failure of “Les Troyens” (The Trojans), the subject of which was taken from the “Æneid” and which he intended to be his masterpiece, was his death-blow.

=His Genius as an Orchestral Composer=.—Berlioz was the founder of the modern school of orchestration, as well as the pioneer in the art of expressing a definite program in terms of absolute music. Like his great contemporary, Wagner, he was no executant; he played but little and, curiously enough, only such insignificant instruments as the flute, flageolet, and guitar. The orchestra was his instrument and no one has ever had a more unerring instinct for its capabilities either as a whole or in its component parts. In the origination of weird, unearthly effects he had been anticipated by Weber, whom he greatly admired; but he went beyond him in devising bold and daring combinations, which he justified by the end in view, though it cannot be said that a refined taste always finds this end in itself justifiable. For example, in the last movement of his “Fantastic Symphony,” he pictures an execution by the guillotine. A company of witches and demons dance around the headless body and perform a burlesque requiem—the whole supposed to be a nightmare suffered by an artist under the influence of opium. Color rather than outline, thrilling and novel effects of sonority, rhythmical variety and animation, intensity of expression and dramatic climax are the principal characteristics of Berlioz’ music. Yet delicacy and charm are by no means lacking in his works. Irregular in proportion and unequal in inspiration as they frequently are, they undoubtedly entitle him to the distinction of being the greatest composer that France has yet produced.

=The Music of the Orchestra= includes Symphonies, Overtures, Symphonic Poems, Tone-Poems and Suites and the Concerto for a solo instrument with orchestral support. The symphony is an elaborated sonata, and the first movement is usually constructed on the principles recognized under the term Sonata-form; the same principles are used in the Overture, which consists of but a single movement. Liszt, in his efforts in the program music style, devised the Symphonic Poem, which aims to present a series of emotional pictures in the Symphonic style, but with the various movements continuous. He advocated deriving _all_ themes from a _common source_, transforming them rhythmically as needed to work out his conception. His successors in this style of music still use the thematic methods devised by the writers in the true symphonic style, but are free in their methods of construction and elaboration.

Grove.—Dictionary of Music and Musicians, articles on the Orchestra and the various instruments used, the Sonata, Symphony, Overture, Suite, etc., and Sonata-Form.

Henderson.—The Orchestra and Orchestral Music.

QUESTIONS.

Why is the orchestra the greatest means for musical expression?

Classify the instruments used in the orchestra.

What difference is there in the combination of instruments in the modern orchestra and in the first attempts?

How did the opera influence the development of the orchestra and orchestral music?

Contrast Bach and Handel. Whose methods are used today to the greater extent?

What did Haydn and Mozart contribute?

What did Beethoven contribute?

Contrast the orchestra used by the composers mentioned.

Give an account of the work of Berlioz in the orchestral field.

Give an account of the great writers of modern times.

What form is the basis of writing for the orchestra?

SUGGESTIONS FOR A REVIEW OF LESSONS XVII TO XXIV.

Independent research on the part of pupils is essential to real mastery of a subject. The following topics can be used as subjects for short essays to be prepared by pupils. The material will be found in this book and in the reference works mentioned in connection with the various lessons.

LESSON XXV.—1. The Pianoforte in America. 2. Pianoforte Makers in the 19th Century. 3. Points of difference between the early Claviers and the Modern Piano.

LESSON XXVI.—1. Comparison between the Early Venetian schools of Painting and Music. 2. The composers of the Early Venetian school. 3. The composers of the Later Venetian school. 4. The development of the Science of Thorough-Bass.

LESSON XXVII.—1. Queen Elizabeth as a Patron of Art. 2. Characteristics of the Early French Clavier school. 3. Influence of the Early English and French Clavier schools on subsequent Writings.

LESSON XXVIII.—1. German character as reflected in early music. 2. Comparison of Bach and Handel's Clavier Works. 3. Influence exerted by the Well-Tempered Clavichord.

LESSON XXIX.—1. Comparison between the Polyphonic and Harmonic styles. 2. Musical influence of J. S. Bach's Children. 3. The First Sonatas compared with Modern Music.

LESSON XXX.—1. German appreciation of music in Haydn's time. 2. Haydn as a man. 3. Haydn's connection with Mozart.

LESSON XXXI.—1. Mozart's character. 2. Mozart's struggles with poverty. 3. Mozart's contributions to form. 4. The Viennese school of this period.

LESSON XXXII.—1. Beethoven's character as shown in his letters. 2. Beethoven's peculiarities. 3. Beethoven and his contemporaries.

LESSON XXXIII.—1. Beethoven's manner of composing. 2. Beethoven's love of nature. 3. Effect of Beethoven upon succeeding composers.

LESSON XXXIV.—1. The points of superiority of the Violin over the Viol. 2. The three great makers of violins. 3. Why the violin is called the King of Instruments.

LESSON XXXV.—1. The character of early violin music. 2. The development of violin playing and composition. 3. Arrange the great players in their respective schools.

LESSON XXXVI.—1. Classify the instruments of the orchestra. 2. Give a sketch of the development of the orchestra, instruments added, etc. 3. Contrast Beethoven's work with that of his predecessors and successors. 4. What is the form of a Symphony? In what respects does the form used by modern composers differ from that of the classical symphony?

LESSON XXXVII.

THE ROMANTIC OPERA. WEBER, SPOHR, MARSCHNER.

=The Romantic Movement=.—The revolutionary spirit which arose in Europe toward the end of the 18th century had its counterpart in a similar intellectual and artistic reaction, commonly known as the Romantic Movement. In Literature, this movement was led by France; in Music, by Germany. Briefly described, it consisted in casting aside the classical traditions which the Renaissance had imposed upon art in general and in a substitution of themes and a treatment more in consonance with the atmosphere of freedom which had inspired such momentous social and political changes.

=Its Effect on Music=.—The musician also felt the influence of the general unrest. In seeking new modes of expression, he rose to a consciousness of independence both as man and artist; he refused longer to occupy the position of an upper servant which had been decreed him by court and nobility. Mozart marked the passing of the old order of things by his indignant rejection of the humiliating conditions of service under the haughty Archbishop of Salzburg, only remembered by later generations through his connection with the musician he treated so contemptuously. Heretofore music had been the privileged entertainment of the great and wealthy. Like other privileges, it was to pass into the possession of the people, hitherto shut out from its enjoyment save in the Church. It was to draw inspiration from a rich store of Folk-lore and poetry heretofore disregarded by the scholar and the musician, but soon to be recognized as a national heritage of high import; it was to create new forms instead of being dependent on time-worn formulæ which were repressing growth and development.

=The Romantic Opera=.—The Romantic Movement had the effect of finally banishing from the stage the characters of classical mythology, the heroes and personages of antiquity who had been thought alone worthy of representation by the poets and savants

who had thus far prepared the texts for operas. In the romantic opera their places were taken by figures of legend or chivalry, elves and spirits of earth or air; the action paid no regard to the unities of time and place; it was brisk and animated and the supernatural played an important part in it. The music, instead of being governed by the restraints of definite forms, adapted itself to the varying exigencies of the drama; the sharp division between the recitative and the aria was softened by the introduction of the Scena, a peculiarly effective mingling of the features of both; the overture became an integral part of the whole by the use of themes associated with leading dramatic situations. The orchestra not only supplied an harmonic and a rhythmically interesting accompaniment but its power of independent expression was enormously enlarged; it became, so to speak, one of the _Dramatis Personæ_ and vied with the singers in indicating psychological and dramatic crises. This was largely due to the development of a new phase of instrumentation, perhaps the most striking detail of the Romantic school—that of novel and original combinations of instruments to produce varying and expressive shades of tone color. Heretofore the orchestra had been considered in the main in its more obvious divisions; sonority and beauty of tone had been the chief aim of the classical composers. =Carl Maria von Weber= (1786-1826) was the first to utilize the individual timbres of orchestral instruments to secure effects of a weird, unearthly character.

[Illustration: CARL MARIA VON WEBER.]

=Weber and the Romantic Opera=.—In his _Der Freischütz_ (The Freeshooter) we first find the union of all these characteristics. Hence Weber is rightfully considered the founder of the romantic opera; but it would be a mistake to assume that he was the originator of all its features. These had been long in the air. In Haydn, the works of Mozart and Beethoven, in the ballads of Loewe, the songs of Schubert, unmistakable romantic traits can often be found, but they are embodied in established forms. Weber, however, brought together the qualities now associated with the term romantic in music, and in applying them to the drama freed them from the restrictions of a fixed musical structure.

=Influence of “Der Freischütz.”=—The effect of _Der Freischütz_ on its production in Berlin in 1821 was instantaneous. The story of the hunter’s recourse to unholy arts in order to win success in the chase, of his rescue from Satanic power and the final triumph of good over evil; the music, fresh, vivid, essentially national in color, appealed to the people to whom the legend was well known. It meant the birth of German opera, German alike in drama and music; it gave the final blow to the supremacy of foreign influences in Germany. This success at first, however, was confined almost entirely to the people. Critics and musicians generally could not reconcile themselves to its mingling of styles; the supernatural element seemed to them exaggerated, the introduction of the Folk-song wanting in dignity. Only the greatest of them all, Beethoven, deaf and cynical as he was, realized the signification of _Der Freischütz_ as the beginning of a new era for German art. He said to Rochlitz: “Weber should now write operas—one after the other without hesitation.”

=Euryanthe=.—Weber’s next opera was _Euryanthe_, produced in 1823 in Vienna. In this he was hampered by a text of more than doubtful merit and lacking the national element which had been so strong a factor in _Der Freischütz_. The story is laid in the medieval chivalric epoch and strongly resembles Shakespeare’s _Cymbeline_. He also ventured upon an innovation which was not in favor with the German public: he set it to music throughout, the place of the dialogue customary in German opera being taken by accompanied recitative. _Euryanthe_ and Spohr’s _Jessonda_, which appeared several months before the former, were the first German operas in this style since Schütz’s _Dafne_. This and its confused plot kept _Euryanthe_ from the popular success achieved by _Der Freischütz_, yet it contains some of Weber’s most thrilling inspirations, and is the direct prototype of the modern music drama.

=Oberon=.—In _Oberon_ (1826), composed for London to an English text, Weber returned to his former manner, though somewhat against his will. He found the English opera much the same as in Purcell’s time, practically a play with music as an incidental feature rather than as an integral part of the drama. He intended casting _Oberon_ into a larger mould, reducing the dialogue and adding to the music, but this was prevented by his premature death in London two months after its production.

=Recitative and Dialogue=.—The chilling effect of alternating speech and song has already been spoken of in connection with the English opera. At that time, both English and German taste was against the use of recitative in the narrative parts of an opera. The _recitativo secco_, which it will be remembered is a recitative supported only by chords on the harpsichord or piano, sometimes accompanied with a single stringed instrument, has never met with favor outside of Italy, where its intonations nearly approach the half-singing inflections of Italian speech. The exclusive use of accompanied recitative—that is, the recitative accompanied by the full orchestra, however, delays the action and moreover appears weighty and overwrought unless applied to subjects of an elevated or heroic character. In Germany and England the desire to understand clearly the dramatic movement led to the retention of dialogue in all operas. In France a distinction was made between operas with dialogue and operas with recitative only. The first is

called Opéra Comique, originally an offshoot from the Italian _Opera Buffa_, in which the _recitativo secco_ was replaced by dialogue. Later the term assumed a technical meaning by which it was applied to all operas containing spoken dialogue whether their subjects were comic or tragic, in contradistinction to what is known as Grand Opéra, in which the accompanied recitative is used exclusively.

=The Melodrama=.—The so-called melodrama is a compromise between the dialogue and the recitative. In this the performer recites in the speaking voice while the orchestra supplies an accompaniment which seeks to intensify the dramatic situation. This device originated in Germany and has found the most favor from German composers. It was first employed by =Georg Benda= (1721-1795) in a recitation, _Ariadne in Naxos_ (1744), which created much interest. Two of the most striking instances of the melodrama are to be found in the grave-digging scene in _Fidelio_ and in the incantation scene in _Der Freischütz_. But however effective its occasional use may be, the ear suffers from the inevitable dissonance between the fixed pitches of the musical scale and the natural inflections of the speaking voice. This is now so generally recognized that it has been practically ignored by modern composers in their works for the stage.

=Spohr and the Romantic Opera=.—=Ludwig Spohr= (1784-1859), Germany's greatest violinist and a composer of eminence in many fields, wrote a number of operas. Of these, _Faust_ and _Jessonda_ stand first in showing a vein of genuine romanticism, albeit they lack the Folk-element which brought Weber's music so close to the hearts of the people. Full of beauty as they undoubtedly are, like all of Spohr's music they are weakened by the constant recurrence of certain mannerisms, such as chromatic progressions of a persistent type, enharmonic modulations, the over-frequent use of diminished intervals. Spohr exercised a strong influence in favor of the new direction on account of his high position as the most esteemed composer and performer of the day. His significance in the romantic movement consists in his being, as it were, an intermediary between the late classical period represented by Beethoven and the modern music drama. He knew Beethoven in Vienna, and in his latter days, when director of the opera in Cassel, did his utmost to introduce Wagner's early operas to the German public.

=Marschner, Weber's Successor=.—Weber's legitimate successor in the romantic opera was =Heinrich Marschner= (1795-1861). He had been associated with Weber as assistant conductor at the opera in Dresden, and a strong friendship existed between them. Weber's influence, however, was wide and far-reaching; it extended beyond the opera. Marschner's sphere was practically confined to the stage, which he enriched with a series of strongly characterized works mainly of a gloomy, uncanny nature. He shows but little of the genial art with which Weber avails himself of the supernatural merely as a background for the doing and striving of his characters, and thus never compromises the human interest they have for us. Marschner makes it the salient characteristic of his strongest works. In these his principal _Dramatis Personæ_ are demons and evil spirits who tempt and torment the innocent and loving. His first romantic opera was _Der Vampyr_ (1825) composed to a text prepared from Byron's poem, "Lord Ruthven," which is founded upon a Scotch legend. Notwithstanding the repulsive nature of the subject, its powerful treatment brought it immediate success in Germany and a little later in England. It was followed by _Der Templar und die Jüdin_ (The Templar and the Jewess), a version of Scott's "Ivanhoe." This, however, met with less success than _Der Vampyr_ or its successor, _Hans Heiling_, Marschner's masterpiece.

=The Spieloper=.—The Romantic school had a strong influence in the development of a form known as the _Spieloper_ (literally play-opera), which occupies a place between the works we have been considering and the _Singspiel_. As thoroughly German as the latter, it shows more finish and greater elaboration of musical effect. Though essentially romantic in the freedom of its scope and choice of means, its real sphere is neither the heroic nor the mystic; it concerns itself rather with the lighter aspects of life, those which require no exalted powers of imagination or wide culture to appreciate—humor, good cheer, the merriment and mirth of the people in holiday mood. =Albert Lortzing= (1803-1851) is accepted as the creator of this type, of which his most popular opera, _Zar und Zimmermann_ (Czar and the Carpenter), is the best known example.

=Influence of the Romantic Opera=.—The value of the application of all the resources of music to the unfettered delineation of feeling and emotion in all their phases inaugurated by the romantic opera can hardly be over-estimated. From the opera it has won its way into absolute music, creating new and original forms. The change it has wrought in the progress and development of the art in general is only second to the revolution occasioned by the birth of the opera itself, three centuries ago. The impulse of the romantic movement in music is far from being exhausted at the present day. On the contrary, it seems to have gathered strength and if it has reached its culmination, as some would have us believe, the signs are not yet apparent to an unprejudiced observer.

QUESTIONS.

What was the Romantic Movement? Its effect on music?

Tell about the Romantic Opera.

Who was the founder of the Romantic Opera?

Give an account of Weber's operas.

Contrast the use of Recitative and Dialogue in opera.

What is the Melodrama?

Give an account of Spohr and his work.

Give an account of Marschner and his work.

What is the Spieloper?

What was the influence of the Romantic Opera?

LESSON XXXVIII.

THE FRENCH SCHOOL OF THE XIXTH CENTURY.

=French Schools of Opéra=.—As already explained, French opera is divided into two styles, known as Opéra Comique and Grand Opéra, according to the use of dialogue or recitative. Not that this is the only difference. The Grand Opéra is naturally adapted to subjects of a large or heroic scope; the Opéra Comique, like the _Spieloper_ in Germany, to lighter episodes of a romantic or humorous nature. As will be seen, however, it not infrequently happens that the latter form is adopted for serious subjects, owing to the fact that it is generally easier for a composer to find acceptance at the Opéra Comique than at the Grand Opéra. The youthful composer or the one who has not yet acquired a name for himself is expected to win his spurs in the former before attempting to enter the latter. Hence, even if his work is somber or tragic in character he often finds it advisable to cast it into the lighter form for the sake of having it produced.

=The Opéra Comique=.—The Opéra Comique had its origin in the introduction of the Opéra Buffa in Paris by an Italian company about the middle of the 18th century, which led to the Gluck-Piccini controversy. Pergolesi's _La Serva Padrona_ in particular awakened great admiration and brought about the creation of a similar type of French opera. It was at first hardly more than an elaboration of the already existing vaudeville, or play with songs. =François Philidor= (1726-1795) and =Andre Grétry= (1741-1813) were its founders. Grace and simplicity, scrupulous adaptation of the music to the clearness of diction always demanded by French taste were its distinguishing characteristics.

=Its Development=.—=Étienne Méhul= (1763-1817), a pupil of Gluck, gave it a larger musical development and a greater depth of dramatic feeling. His _Joseph_ (1807), founded on Biblical history, is a classic of this school. Its dignity, its severe and noble style won less cordial recognition in France than in Germany; a generation later it was to exercise a decisive influence on the future creator of the music drama. It was through a performance of _Joseph_ that Richard Wagner, then director of the opera in Riga, first felt inspired to battle against the empty conventionalities of the operatic stage. Méhul's enlargement of the Opéra Comique was carried on by Cherubini, who through the ill-will of Napoleon found the doors of the Académie de Musique, the technical title of the Grand Opéra, closed against him. Even his greatest tragic opera, _Medée_ (Medea), was produced (1797) as an opéra comique without recitative and ballet, the latter being also reserved exclusively for Grand Opéra. Thus it often happened that there was little, in many cases no intrinsic difference between the music of the two schools.

=The Typical Opéra Comique=.—There was, on the other hand, a development of a type more closely corresponding to the original scheme of the Opéra Comique. Strongly influenced by the romantic tendencies of the day, its romanticism by no means resembles that of the German school as represented by Weber and his followers. This, in its appeal to the deeper emotions by the idealization of nature and recourse to the supernatural, is thoroughly alien to the Gallic temperament, and had no appreciable effect on French composers. Gaiety and humor, freshness of invention, lightness of touch, elegance and finish characterize the true Opéra Comique. Its pathos never sinks below a certain sentiment which is skilfully used rather for the sake of contrast than from any persistent attempt at awakening the more somber feelings. The singer and the actor both meet with consideration; the former by

sparkling melodies, expressive and grateful to sing, not over-burdened with the technical difficulties in which the Italian school abounds; the latter by a drama furnishing piquant situations, seasoned with wit and interesting in itself as a play.

=Boieldieu, its Founder=.—As Méhul gave the impulse to the graver, more dignified style, so =François Boieldieu= (1775-1834) laid the foundation of the typical Opéra Comique, the most original and essentially national French operatic form. His _Jean de Paris_ (John of Paris) and _La Dame Blanche_ (The White Lady) placed him at the head of this school. The latter in particular, based on a curious combination of situations taken from two of Scott's novels, "The Monastery" and "Guy Mannering," has been sung the world over and still remains an unsurpassed example of the Opéra Comique in its best estate.

=Auber=.—The most prolific composer in this style was =Daniel Auber= (1782-1871). Though he began as an amateur and after years spent in other pursuits, he outlived all his early contemporaries and became its most widely known representative. With one exception, to be noticed later, his works reveal the salient characteristics of the school—freshness and melodic charm, finesse of rhythm and instrumentation, delicacy and refinement rather than power and depth. His most popular opera, _Fra Diavolo_ (1830), has been sung on all stages and in almost all languages. Others less known but equally meritorious are _Le Maçon_ (The Mason and the Locksmith), _Le Domino Noir_ (The Black Domino) and _Les Diamants de la Couronne_ (The Crown Diamonds.)

=Hérold and Adam=.—=Louis Hérold= (1791-1833), as a pupil of Méhul, inclines to a more serious style. His _Zampa_ contains strongly romantic features which made it more successful in Germany than the melodious _Le Pré aux Clercs_ (The Clerks' Meadow—a noted duelling ground in Paris during the 17th century), though in France this vies with _La Dame Blanche_ in the distinction of being the most popular Opéra Comique in the repertory. Though less significant than any of the foregoing, =Adolphe Adam= (1803-1856), the composer of _Le Postillon de Longjumeau_ (The Postilion of Longjumeau), deserves mention for the grace and fluency of his melodies, albeit they show a decline in character and style which prefigures the decadent school of the _Opéra Bouffe_ (burlesque opera).

=Opéra Bouffe=.—The attentive observer can hardly fail to perceive that the opera as appealing to the people at large more than any other form of music is peculiarly susceptible to social and political influences. The Opéra Bouffe being a degenerate offshoot from the Opéra Comique, it is no mere accident that the period of its most extended popularity coincided with the extravagance and folly of the Second Empire. As a distinct type it is due to =Jacques Offenbach= (1819-1880), a German by birth, who took advantage of the taste of the time by turning his attention to the parody of the classical and mythological subjects which had furnished material for the early operas. Frivolous and mocking in text, sprightly and vivacious in melody and rhythm, his operettas possess undoubted piquancy and an effervescent style which for a time intoxicated the public. Their vogue was happily broken by a series of light operas of much more worth. Of these, _Les Cloches de Corneville_, known to Americans as "The Chimes of Normandy," by =Robert Planquette= (1840-1903) is the best example.

=The Influence of the Opéra Comique=.—The Opéra Comique, as founded by Boieldieu and continued by Auber and Hérold, bears a distinctively national character to a much greater degree than the more cosmopolitan Grand Opéra. Unlike this, its development was entirely due to native composers who gave it the thoroughly Gallic impress of spirit, vivacity, and truth to nature which carried it triumphantly through all the theatres of Europe. Thus it served to counteract in part the reactionary tendency of Italian opera. In Paris, as elsewhere, during the first quarter of the 19th century Italian influences were very powerful; Rossini's works and those of his imitators had the undesirable effect of reviving in a modernized form the conventionalized opera of the 18th century, the chief object of which was the display of the singer. The Opéra Comique, though limited to the lighter phases of the drama, performed a service of no small value in upholding a standard of legitimate musical expression at a time when the allurements of florid song were obscuring the dramatic ideals which Gluck had established at the cost of so much labor and effort.

=Grand Opéra=.—About the same time, important changes were impending in Grand Opéra, though these were more in the nature of a development from the type founded by Lully and afterward enlarged by Rameau, Gluck and Spontini than a revolution such as Weber and his followers had effected in Germany. They were, however, the outcome of the same romantic influences modified by the characteristic French adherence to established form. A grand opera according to tradition must have five acts, consisting of arias, ensembles, choruses, etc., connected by recitatives, with a ballet in one or two of the middle acts, generally the second and fourth.

=Its Change of Style=.—Auber's _La Muette de Portici_ (The Dumb Girl of Portici—known also as Masaniello), produced at the Académie de Musique in 1828, formed the point of departure for the new style. Though it held to the traditional form of Grand Opéra, it was in spirit, theme and treatment a startling change from the ordinarily genial works of this composer, characterized as it

was by a force and fire, a vigor and decision which he had never shown before and was never to show again. It marks the beginning of the modern historical opera, the complete abandonment of classical and ancient history as the only appropriate material for Grand Opéra. The people were brought upon the stage not as slaves or as meekly acquiescing in the will of those in authority, but as insurrectionists demanding rights of which they had been defrauded. The story of the Neapolitan fisherman leading his comrades into rebellion against their tyrannical rulers had a powerful effect in the agitated state of political affairs which culminated in the revolutions of 1830. It is significant that a performance of _La Muette de Portici_ immediately preceded the riots in Brussels, which in that year resulted in the expulsion of the Dutch from Belgium. Rossini's _William Tell_, which followed in 1829, manifested precisely the same tendencies, musically as well as dramatically. Both were destined to be cast into the shade by the works of a third composer who gave the French grand opera a style which practically dictated conditions on all stages for half a century and is still not without influence.

[Illustration: GIACOMO MEYERBEER.]

=Meyerbeer=.—This composer was =Giacomo Meyerbeer= (1791-1864), German by birth and early education, Italian by training in more mature years, and finally French by adoption. A juvenile pianist of great promise, he studied with Clementi; he went through a severe course of fugue and counterpoint with Zelter, the teacher of Mendelssohn; in composition he was a fellow-student with Weber under the famous Abbé Vogler. In Vienna he knew Beethoven and was advised by Salieri to study in Italy, where he wrote a number of Italian operas after the style of Rossini. In 1826, he went to Paris, the Mecca of all opera composers, with the design of making himself familiar with the conditions of Grand Opéra.

=His First Grand Opera=.—The result of his studies was _Robert le Diable_ (Robert the Devil) produced in 1831. This created a veritable sensation. Nothing of so comprehensive a style had been seen or heard before. Meyerbeer's cosmopolitan education, his receptive rather than original mind, enabled him to combine the outward characteristics at least of the three schools—French, German, Italian—as no one had ever attempted. The story of the arch-enemy of mankind seeking to ensnare a son by an earthly mother into sharing his lost condition, the struggle between the powers of good and evil for the mastery of the tempted soul gave full scope to such an amalgamation of styles. The ballet and spectacular effects of Lully, the supernaturalism of Weber, the roulades of Rossini were all brought together with an art that dazzled and intoxicated an admiring public.

=His Other Grand Operas=.—Five years later _Robert_ was followed by _Les Huguenots_ (The Huguenots), which achieved a still greater success, and is the one opera of Meyerbeer which continues to hold its own against the encroachments of time. In one or two episodes of _Le Prophète_ (The Prophet), which was produced in 1849, the composer reached the highest level of his creative activity, notwithstanding the manifest artificiality of his scheme. His last work, _L'Africaine_ (The African), was brought out the year after his death and like the others owed its success to a skilful mingling of all the elements, musical, spectacular, and dramatic, which go to make up this type of opera. His _L'Étoile du Nord_ (Star of the North) and _Le Pardon de Ploërmel_ (better known as Dinorah) were composed for the Opéra Comique.

=Influence of Meyerbeer=.—Meyerbeer so held the public in his grip that other composers of Grand Opéra gained but slight attention during his lifetime. Only =Jacques Halévy= (1799-1862) was able to meet him on equal terms in this field with _La Juive_ (The Jewess), in which he shows the earnest spirit of his master Cherubini. Though Meyerbeer's watchword was success at any cost and his aim to assure it by the accumulation of cunningly devised sensations rather than through the innate power of his music, his works had a powerful and, on the whole, a beneficial influence on the course of modern dramatic music. They placed living, palpitating beings on the stage instead of the cold abstractions of mythology and antiquity; the singer was forced to impersonate as well as to sing. His insistence on all means of expression—vocal, instrumental, and scenic—though often exaggerated and fatal to purity of style, led to an extension of technical ability in all these directions, and prepared the way for a master of greater power and higher aims. It must not be overlooked that Richard Wagner frankly modeled his _Rienzi_ (1842) after _Les Huguenots_, and that Meyerbeer in _Le Prophète_ shows plainly the influence of this work by his German contemporary.

QUESTIONS.

What two styles are found in French opera?

Tell about the origin of Opéra Comique.

Tell about the development of Opéra Comique.

Describe the typical opéra comique.

Mention the prominent composers in this form and their work.

Describe Opéra Bouffe.

What composers were prominent in this form?

What was the influence of the Opéra Comique?

What was the established form of Grand Opéra?

Who contributed to a change of style? What were the changes?

Give an account of Meyerbeer and his work in Opera.

What was his influence?

LESSON XXXIX.

THE ITALIAN SCHOOL OF THE XIXTH CENTURY.

=Later Italian School=.—While Meyerbeer was dominating the French stage and through it exerting a powerful influence on serious opera in all countries, the Italian school was recovering in part from the impulse given it by Rossini. The highly ornamented style which he brought into vogue was modified in the works of several composers who also gave more consideration to truth of expression. With these, melody still reigned supreme, but it was shorn of the excessive ornamentation which overloaded Rossini's music; in character and rhythm it was also more generally in accord with sentiment and situation. The florid element was by no means suppressed; it had been an integral factor in Italian music for two centuries and was too strongly entrenched in public favor to be banished so completely as it had been in the German romantic opera, but it was kept in subordination and in the main not allowed to dictate the melodic idea. This was a step in advance for the Italian school of that period, which through the fluent warblings of Rossini and his imitators, had approached dangerously near the Scarlatti-Handel type of the previous century.

=Donizetti=.—This reaction in the direction of greater simplicity and sincerity was led by =Gaetano Donizetti= (1797-1848). At first a follower of Rossini, he only attained success after the latter had ceased composing and he himself had acquired a style of his own. Donizetti was not without innate force, but his great melodic facility led him to rely upon melody rather than upon musical development or dramatic characterization. Hence his tragic operas, though often admirable in detail, lack the sustained strength demanded by their subjects. Of these, _Lucia_ (founded upon Scott's "Bride of Lammermoor") achieved the greatest popularity, while in _La Favorita_ (composed for the Grand Opéra) he shows more dramatic power than in any of his more than three-score operas. In many of his lighter works he is particularly happy; for example, in _Don Pasquale_, which compares favorably with Rossini's _Il Barbiere_, and in _L'Elisire d'Amore_ (The Elixir of Love). _La Fille du Régiment_ (The Daughter of the Regiment—written for the Opéra Comique) has made the tour of the world.

=Bellini=.—His younger contemporary, =Vincenzo Bellini= (1801-1835), on the contrary, displays no capacity for humor nor is he much better fitted to cope with the somber or the heroic. Essentially a lyrical temperament, neither broad nor deep but endowed with exquisite sensibility within certain limits, his sphere is the emotional, the tender and the elegiac. For this reason his charming opera, _La Sonnambula_ (The Somnambulist), on account of its idyllic subject, is a more representative work than _Norma_ or _I Puritani_ (The Puritans), though both enjoyed high popularity until within recent years. Much of Bellini's vogue was due to the admirable singing of a number of Italian artists who were identified with his works—Pasta, Grisi, sopranos; Mario, tenor; Tamburini, baritone; Lablache, basso, not to forget Jenny Lind, who was at her best in his operas. With their passing and the establishment of the modern school of dramatic composition, in which the voice is only one of many factors instead of being the chief element of expression, they have gradually dropped from the repertory.

=Verdi=.—A far more significant personality than either Donizetti or Bellini is =Giuseppe Verdi= (1813-1901). Not merely a melodist but a dramatist as well, his long life gave him the opportunity of profiting by the many influences which brought about the mighty musical development of the last hundred years. The fact that he did so without compromising his artistic or national individuality shows the inherent genius which gives to him the distinction of being the great Italian composer of the century. Strong and sturdy from the first, his early works, if somewhat coarse in fiber, seemed doubly powerful in contrast with those of his contemporaries, which were distinguished by sweetness and melody rather than by depth or vigor. From _Ernani_ to _Rigoletto_, from the much

sung _Trovatore_ to _Don Carlos_, to mention only a few of his thirty operas, Verdi shows a steady growth in largeness of style and command of means which culminated in _Aïda_, written for the Khedive of Egypt to celebrate the opening of the Suez canal in 1871.

[Illustration: GIUSEPPE VERDI.]

=Aïda=.—_Aïda_ is the full fruition of the Romantic movement beyond the Alps, manifested, however, in a style and manner thoroughly Italian. Unmistakably influenced by the uncompromising stand taken in Germany by Wagner, Verdi here shows the definite adoption of a new standard, yet by methods which make no decided break with what he had hitherto accomplished. In form, _Aïda_ is closely allied to the Meyerbeer type of Grand Opéra through its succession of dramatic and spectacular features, but these develop naturally in the course of the action and are combined with a sincerity and unity of effect lacking in the more artificial creations of the German composer. The florid style is strictly avoided; without the continuous flow of the music drama, the different movements, recitatives, arias, ensembles, etc., are yet more closely connected and are sustained by a richer, more fluent orchestration than he had hitherto given to his operas, the local color called for by the Egyptian theme receiving adequate consideration.

=Significance of Aïda=.—_Aïda_ marks the beginning of the new Italian school, one more in sympathy with the original conception of the opera as a drama, while retaining the characteristic Italian grace and charm of vocal treatment. This school was still further enlarged and developed by Verdi, but this extension belongs to a later period and will be considered in its logical connection.

=Wagner and the Music Drama=.—It is to =Richard Wagner= (1813-1883) that we owe the renaissance in modern form of the primitive ideal of the opera as embodied in the works of Peri and Caccini. Simple and formless as these now appear, they contain the germ of all that he has accomplished, apart from the question of means, even to the very name of music drama. This he revived because, in his opinion, the term opera had acquired a preponderantly musical signification which made it inappropriate for his later works in view of their dramatic character. An exception to the general rule of precocity among musicians, it was not until his sixteenth year that he resolved to devote himself to music. Like Weber, whom as a child he saw frequently and regarded with the utmost reverence, his early associations were with the theatre and the drama, a fact of no small significance in the careers of both. _Der Freischütz_ was his favorite opera, a liking which bore abundant fruit in later years.

[Illustration: WAGNER IN 1853.]

=His Early Operas=.—The future master of the music drama, however, began by composing operas—operas, moreover, in which he shows originality in one feature only—that of writing their texts himself, and this remained his invariable practice. In other respects they gave no hint of the startling individuality he was to unfold so unexpectedly in his _Flying Dutchman_. His first opera was _Die Feen_ (The Fairies). It was based on a fairy tale of but slight worth, and the music was strongly reminiscent of Weber and Marschner. As the work of a youth of twenty, without reputation or influence, it is hardly surprising that he found no manager willing to produce it. He was somewhat more fortunate with his second opera, _Das Liebesverbot_ (The Love Veto), an adaptation of Shakespeare's "Measure for Measure." This was performed once, in 1836, at Magdeburg, where he was director of the opera, and had thus come under the influence of the French and Italian composers then popular in Germany. The music is such a palpable imitation of Adam, Auber, Donizetti, and Bellini that it has never been given since. _Die Feen_ was never produced during his lifetime, but a few years after his death received a number of representations in Munich.

=His Sojourn in Paris=.—In 1839, he determined to go to Paris. Many foreign composers had succeeded in entering the Grand Opéra, among them Meyerbeer, then in the full flush of the renown he had gained with _Les Huguenots_. What one German had done, another might attempt. Accordingly, with the utmost faith in his star and amid manifold discouragements, Wagner made his way to the French capital, where he hoped through the influence of Meyerbeer to secure the acceptance of his _Rienzi_ at the Grand Opéra. He had prepared it from Bulwer's novel of the same name with the express intention of utilizing it as a framework for the large spectacular style demanded by the Académie de Musique. His sojourn in Paris brought him nothing but disappointment. Neither _Rienzi_ nor _Der Fliegende Holländer_ (The Flying Dutchman), which he wrote during his stay of two and a half years, was successful in winning a hearing, while he lived the greater part of the time in the most painfully straitened circumstances.

=Rienzi=.—Before long, he realized the hopelessness of his endeavor and sent _Rienzi_ to Dresden, where it was accepted and after a long delay performed in 1842. The result was a triumphant success and led to the speedy production of _The Flying Dutchman_. This, however, by no means made a similar impression. _Rienzi_ was an opera of the type made familiar by Meyerbeer, in which effect was secured by the heaping together of every device known to stagecraft. The ballet, the march of the

Messengers of Peace, the final catastrophe of the burning of Rome, had as much to do with its enthusiastic reception as the music, which was noisy, showy and brilliant, as befitted a work of such calibre.

=The Flying Dutchman. Change of Style=.—_The Flying Dutchman_, however, showed Wagner in an entirely different light. With it, instead of receiving his inspiration from without, as had been the case with the preceding operas, it came from within. On his way to Paris he had made a stormy voyage of several weeks from a port on the Baltic to London. He was familiar with the myth of the Flying Dutchman, and found that the sailors on board his ship believed it implicitly. This in connection with Heine's version of the legend, which represents the unhappy mariner as doomed to perpetual wandering on stormy seas until he finds a woman faithful unto death, made a strong impression on him, and while in Paris he wrote the poem and composed the music within seven weeks after finishing _Rienzi_. A more sudden metamorphosis of style is unknown in the history of music. The earlier work was an opera pure and simple, in the ordinary acceptation of the term, characterized by pomp, brilliancy, sonority. Its successor was conceived as a drama in which music served to emphasize the action and to intensify the emotional situations; instead of being master, it was servant; external effects were disregarded save only as they were in harmony with this conception. Not that the composer entirely achieved this ideal; _The Flying Dutchman_ displays not a few lapses into operatic conventionalities, but as a whole it was a startling and radical change which puzzled and displeased the public. They had looked for something in the style of _Rienzi_ and could make nothing of a work so contrary to the popular idea of what an opera should be. Accordingly, after a few performances, it was dropped from the repertory.

=Tannhäuser=.—Nothing daunted by the lack of favor shown his change of style, Wagner carried it to a still greater extent in his next opera, _Tannhäuser_ (1845), founded on a medieval legend. The dramatic motive of this is much the same as that of _The Flying Dutchman_, one of which Wagner was particularly fond—the power of love to redeem and save from the consequences of sin and error. _Tannhäuser_ brought about his head the full storm of hostile criticism which with _The Flying Dutchman_ had only begun to lower. He was reproached for its difficulty, for its lack of pleasing melodies, for the audacious harmonies which many critics considered inexcusable dissonances. Singers objected to the broad declamation it required; they complained that it would eventually ruin their voices.

=Lohengrin=.—This almost general dissatisfaction, however, led to no concessions by the composer in his next opera, _Lohengrin_, which marked a further advance in the unpopular direction taken by its predecessors, but it interfered with its performance. Though he was conductor of the Opéra at Dresden, he could not secure permission to produce it. Baffled and discouraged in his artistic schemes, a radical in politics, he joined the insurrectionists during the revolution of 1849. The failure of the rebellion necessitated a hasty flight from Germany. He took refuge in Switzerland and remained in exile until a proclamation of amnesty in 1861 allowed him to return. In the meantime he had sent the score of _Lohengrin_ to Liszt, then conductor of the opera at Weimar, and there it was brought out in 1850.

Lohengrin proved the turning-point in his fortunes. The romance of the subject, its dramatic treatment and undeniable beauty gradually reconciled the public to the novelty of its style. Before Wagner was relieved from his sentence of banishment it had become one of the most popular operas in Germany—he once ruefully remarked that he would soon be the only German who had not heard it.

QUESTIONS.

Who led in the changes in Italian Opera after Rossini?

Give an account of Donizetti and his work.

Give an account of Bellini and his work.

Give an account of Verdi and his earlier works.

What is the significance of Aïda in the history of Opera?

Tell about the changes that Wagner was to make.

Give an account of his early operas.

Why did he go to Paris?

Describe Rienzi, The Flying Dutchman, Tannhäuser, Lohengrin.

LESSON XL.

RICHARD WAGNER'S MUSIC DRAMAS. OTHER SCHOOLS.

=Wagner's Theory of the Music Drama=.—_Lohengrin_, like _The Flying Dutchman_, was transitional in character and led into Wagner's third manner. It was his last opera; all his later works were known as music dramas. In these he pursued unhesitatingly the logical conclusions of the theories which he expounded at great length in his controversial writings, though he was far from being always consistent with himself. Thus he reasoned that since in the spoken drama but one speaker is heard at a time, the same practice should prevail in the music drama, which would naturally do away with all concerted music, choruses, etc. This rule he observed in _The Ring of the Nibelungen_, but he wisely abandoned it in his later works. In _Die Meistersinger_ he also failed to follow his theory that mythical and legendary subjects were the only suitable material for the music drama. Briefly stated, his ultimate conclusion was as follows: that the art-work of the future, as he called it, should consist of a synthesis of all the arts. Music, poetry, painting, sculpture, architecture, he asserted, had exhausted all that was possible to them as separate arts; a higher plane could be reached hereafter only by a combination which should gain unity by subordination to a single principle. This principle he found in poetry. Beethoven, he argued, had felt the insufficiency of music alone to express his deepest inspiration, and for that reason had incorporated in his last and greatest symphony a choral movement to the words of Schiller's "Ode to Joy." In the music drama, therefore, the scene painter replaces the artist and the architect, the actor by plastic poses the sculptor, while the musician must allow his music no form but that dictated by the poet in his verses. He ascribed the thrilling effect of the Greek drama to such a union of the arts and this it was his aim to revive through his own works.

=The Leading Motive=.—The part assigned by the Greek dramatists to the chorus who expounded and commented on the events of the play was in his scheme transferred to the orchestra. This he did by means of the _Leitmotiv_ (leading motive). A leitmotiv is a characteristic theme or harmonic progression associated with each of the _Dramatis Personæ_ and which appears with such modification of mode, rhythm, or any of its component parts as the dramatic situation demands. It is not confined to personages alone; in _The Ring of the Nibelung_, for instance, the stolen gold, the ring formed from it, the sword which plays such an important part in _Die Walküre_ and in _Siegfried_ all have their corresponding motives. It is through these motives that Wagner is able to give his orchestra an all but articulate speech and to weld the music drama into an organic whole. By their transformation and development he succeeds in indicating psychological states and changes as well as material conditions and objects. Reminiscent themes of a somewhat similar nature had been used as far back as Mozart and had been employed more freely by composers of the Romantic school, notably by Weber in _Der Freischütz_ and _Euryanthe_, but they were undeveloped and elementary in character. Berlioz in his _Fantastic Symphony_ was the first to conceive a typical theme and to alter it in logical accordance with the progression of his program, but he did not adopt the practice in his operas.

[Illustration: WILHELM RICHARD WAGNER.]

=The Unending Melody=.—Beginning with _Lohengrin_, Wagner abandoned fixed forms and substituted what he called unending melody, a practically continuous flow of tone divided alike between voices and instruments. For the most part he assigned the singer a declamation as far removed from the set aria on the one hand as it was from dry recitative of the early Italian opera on the other. Yet like the latter it was conditioned by principles of speech. Like the early composers, also, his subjects with but two exceptions were mythical or legendary. This, because the supernatural and the unreal correspond more closely with the ideal element introduced by the use of song for speech than material drawn from everyday experience or from the exact chronicles of history.

=The Ring of the Nibelung=.—In the old Teutonic folk-epic, the _Nibelungen Lied_ (Lay of the Nibelung), Wagner found the inspiration for his next and most extended work. This is the great tetralogy, _Der Ring des Nibelung_ (The Ring of the Nibelung), composed of four dramas designed for continuous representation: _Das Rheingold_ (The Rhine Gold), _Die Walküre_ (The Valkyrie), _Siegfried_, _Die Götterdämmerung_ (The Twilight of the Gods). It was begun and partially finished during his stay in Switzerland, but his discouragement over what he felt to be the hopeless task of ever securing its performance led him to abandon it and to set to work on another drama which he decided should be lighter in character and less difficult to execute, in order the more readily to find acceptance.

=Tristan and Isolde=.—The result of this resolution was _Tristan und Isolde_, but far from being a return to his earlier style, as he had planned, it was and probably still is the most intricate operatic score in existence. It was accepted by the Opera in Vienna, but after fifty-seven rehearsals the singers declared themselves unable to learn it and it was given up as impossible of execution. Three years after his return to Germany an unlooked-for change took place in his fortunes. The young king of Bavaria, Ludwig II, who had just ascended the throne, had been an ardent admirer of Wagner since as a boy of fifteen he had heard _Lohengrin_. Hardly had he taken his seat before he summoned the discouraged composer to Munich and assured him support and protection. _Tristan und Isolde_ was soon brought out (1865), and Wagner busied himself with the composition of _Die Meistersinger von Nürnberg_ (The Master Singers of Nuremberg), produced in 1868.

=Die Meistersinger=.—This is his only comic work, full of hitherto unsuspected humor and geniality. The story of the young poet endeavoring to gain admission to the jealously-guarded ranks of the master singers who, notwithstanding the beauty of his song, reject him because he has violated their hide-bound rules has a distinctly autobiographic value. Wagner had endured too much from similar pedants to be lenient with the picture he drew of their prototypes in medieval Nuremberg. As strikingly diatonic in style as _Tristan und Isolde_ is chromatic, these two works are the strongest illustrations of his versatility.

=Bayreuth and the Festival Theatre=.—Wagner had long cherished the plan of a festival theatre for the performance of his _Ring of the Nibelung_. Jealousy of his favor with the king led to various intrigues which prevented the building of such a theatre in Munich. The quiet town of Bayreuth, therefore, as being a central point, was chosen, and there in 1876 the _Festspielhaus_ was opened with the first complete performance of the Tetralogy. It made a profound impression, but the expense of the undertaking was so great that it resulted in a heavy loss and the theatre was closed for a number of years. In 1882, however, it reopened with _Parsifal_ and since then its triumphant career has been part of musical history.

=Parsifal=.—Until 1903, when it was given in this country, _Parsifal_ was heard only in Bayreuth. Its semi-sacred character, its mingling of religious mysticism and sorcery, its unrivaled stage effects, its overwhelming power of climax, the consummate art of its thematic construction have made it the most discussed of Wagner's works. What place it may eventually hold in respect to the others can be decided only by time. As it is, it stands alone; a second _Parsifal_ is hardly conceivable.

=Influence of Wagner=.—Unlike Weber, Wagner did not create a school—he belonged to the school which Weber founded. Like Gluck, his influence permeated all schools but to a much greater extent; none has succeeded in escaping it. Thus far in Germany it has been felt more in the development of program music, the symphonic poem, etc., than in the music drama itself. Many have attempted to follow directly in his steps, among them =August Bungert= (1846———) with a cycle of music dramas, _Die Homerische Welt_ (The World of Homer), founded upon the Iliad and the Odyssey, and =Richard Strauss= (1864———) with his _Guntram_, _Feuersnoth_ (Fire Famine) and _Salome_, but none has yet shown the power to bend the bow of Achilles. =Engelbert Humperdinck= (1854———) is the only one of Wagner's successors to develop a new phase of the music drama. This he did by applying it to the fairy tale in his _Hänsel und Gretel_ (1893), which soon found its way to all stages, the first German opera to have such a success since the death of Wagner.

=Wagner in France=.—In France, Wagner acted at first not so much directly as indirectly, and more in his connection with the Romantic school of Weber than through his individual style as revealed in the music drama. The characteristic conservatism of the French school was shown in holding to forms which had been fixed for generations, but little by little these were filled with the new romantic spirit. This comes to the fore in =Charles Gounod= (1818-1893), whose _Faust_ (1859) has exercised a strong and lasting influence on the lyric drama in France. Though set forms are not abandoned, they are closely joined by a melodious declamation which approaches the song-speech of Wagner; the orchestration, too, is unmistakably romantic in treatment. =Georges Bizet= (1838-1875) in _Carmen_ (1875), an opéra comique notwithstanding its tragic denouement, produced a work of great individuality, which shows even more plainly the influence of modern romanticism. Had the composer's career not been cut short by his untimely death, it is possible that the French school would have maintained a more commanding position. For Paris no longer holds her former preëminence as operatic centre; she has been distanced by Bayreuth. Of late years the works that have had the most pronounced success in the French capital have been Wagner's music dramas. A little more than a generation ago, in the palmy days of Auber and Meyerbeer, a success at the Grand Opéra or the Opéra Comique had an international import and meant a speedy transference to foreign stages. Now the interest is largely local; but few of the modern French operas are heard outside of France. The influence of Wagner is evident in a new French school, consisting in the main of young composers whose works manifest strongly transitional features. At present this school is in its storm and stress period; it is yet too early to forecast its ultimate effect.

=Wagner in Italy=.—Italy proved more responsive to Wagner's influence than France. The performance of _Lohengrin_ (1868), in Bologna, created much enthusiasm among the young musicians of northern Italy, but it was the septuagenarian Verdi who inaugurated the era of the music drama by his _Otello_ (1887) and _Falstaff_ (1893). Strictly speaking, he had been anticipated by =Arrigo Boïto= (1842———), who, thrown under Wagner's influence in Germany, had followed his example in being the poet and composer alike of _Mefistofele_ (1868), a version of the Faust legend. But this was Boïto's only opera, and though he gave the initial impulse to the movement, it was Verdi who carried it to a triumphant issue.

=Verdi's Latest Style=.—_Aïda_ had been a grand opera with strong musico-dramatic tendencies. In _Otello_ and _Falstaff_, Verdi made a definite entrance into the music drama. The latter in particular, founded on Shakespeare's "Merry Wives of Windsor," is an astonishing _tour de force_ for a man of four-score years. Full of the sparkle and freshness of youth, yet in every measure revealing the ripeness of matured genius, it is one of an immortal trio of lyric comedies of which the others are Mozart's _Figaro_ and Wagner's _Meistersinger_. The set and traditional forms of the opera here disappear entirely; the music is conditioned by the text and its dramatic requirements; the orchestra supports the voices in a full, melodious, and comprehensive flow, but never overpowers them. Hardly anything can be detached from its context without losing significance and interest; and this, by the way, is one of the most distinctive peculiarities of the music drama and more than anything else points the radical difference between it and the opera. Yet though this change of manner is undoubtedly due to Wagner, Verdi is in no sense an imitator. The style remains his own and is essentially Italian in character—that is, it is based upon vocal rather than instrumental capabilities.

=The New Italian School=.—The latest development of the music drama in Italy has been in the direction of so-called naturalism. This consists in the choice of brutal phases of life for illustration, told in short, concise forms which concentrate and hasten the dramatic action. A greater contrast to the inordinately long and heroic operas of Meyerbeer and Wagner can hardly be imagined; it is more than probable, indeed, that the reaction against the excessive length of the music drama led to the great and sudden vogue of this school. The first impulse to naturalism was given by =Pietro Mascagni= (1863———) in his two-act opera, _Cavalleria Rusticana_ (Rustic Chivalry), in 1890. This is a tale of love, jealousy, and revenge told in music admirably adapted to the vivid, crude representation of elemental passions. Two years later followed _I Pagliacci_ (The Clowns) by =Ruggiero Leoncavallo= (1858———), a work of precisely the same character. Though many others have essayed the same style, these two thus far remain the most representative of their class. Their popularity has been approached only by =Giacomo Puccini= (1858———) in _La Bohême_ (The Bohemians), produced in 1896. Four years later his _Tosca_ appeared and did much to strengthen the impression given by its predecessor—that in Puccini Italy possesses her most promising dramatic composer.

=Schools Compared=.—Thus at the beginning of the 20th century we find the principles of the music drama as enunciated by Wagner influencing all the three great schools of dramatic composition. It is worthy of note, however, that these schools, though thus approaching in artistic ideals, still retain the characteristics which distinguished them from the very beginning: the Italian, melody and beauty of tone; the French, clearness of form and logical dramatic development; the German, elevation of subject and harmonic richness.

=Younger Schools=.—Younger schools having a strongly national character exist in Russia and Bohemia, but as yet they possess only local signification and have produced no practical effect outside of their respective countries. =Michael Glinka= (1803-1857) with his patriotic opera, _Life for the Czar_, founded the Russian opera in 1836. The Bohemian opera is of more recent origin and is associated principally with the names of =Friedrich Smetana= (1824-1884) and =Antonin Dvo■ák= (1841-1904).

=Resumé=.—From its dual nature, the opera is necessarily a compromise. Composed of two elements, the musical and the dramatic, it is peculiarly susceptible to disintegration; its history is a record of almost continuous veering from one to the other of these two phases. We have seen how the immense proportions of the ancient amphitheatres led to the musical declamation on which the opera is founded, from the fact that the tones of the singing voice are far more reaching than those of the voice in speaking. The Florentine experimenters, in seeking to restore this declamation, soon discovered the capabilities for emotional expression latent in the varying timbres and vastly extended range of the former. As for its musical possibilities, these were entirely beyond their ken. The steps taken in that direction they regarded with disfavor as indicating a deviation from the oratorical standards which were their sole aim. After Carissimi and Scarlatti had developed the elements of symmetrical form and melody, music emerged from this dependent condition and dictated to the drama, which sank to an almost negligible factor. The reaction led by Gluck served to restore the balance for a time, but through Rossini and his followers the pendulum again swung in the other direction. The Romantic movement then brought the drama again to the fore; the spirit of the age was behind it and all schools felt its influence, though each manifested it in characteristic fashion.

=Influence of the Opera on Music in General=.—These alternations have had a powerful effect on the development of music in general, an effect both technical and expressive in nature. From the harpsichord and the few viols used at first merely to support the voice and to give it pitch, the orchestra expanded into a large body of instruments capable in itself of dramatic utterance. From the tiny ritornello of eight measures played by three flutes in Peri's _Euridice_, there has grown an independent instrumental art of vast significance. The opera also created a school of singing which though often unworthily used for purposes of purely personal display is the basis of the vocal art of today. In short, it is not too much to say that the little band of scholars and musicians who met three centuries ago with the aim of reviving a lost art practically originated a new one.

QUESTIONS.

Give an account of Wagner's theory of the Music Drama.

What is meant by the term Leading Motive? Unending melody?

What works compose the Ring series?

Tell about "Tristan und Isolde," "Die Meistersinger."

In what city was a theatre built for Wagner's dramas?

Describe "Parsifal."

What composers has Wagner influenced?

What was his influence on French composers and the names of those most prominent; their works?

What was his influence upon the Young Italian school?

Who are the prominent members of that school?

What changes did Verdi show in his latest works?

What are the characteristics of the various schools?

Give a résumé of the development of opera.

What has been the influence of opera upon music?

REVIEW SUGGESTIONS, LESSONS XXXVII TO XL.

What was the effect of the Romantic movement on the Opera?

Write a sketch of Weber and his work in Opera.

What differences are there between Opéra Comique and Grand Opéra?

Compare the works of Spohr and Marschner with those of Weber.

Describe the typical Opéra Comique and name some notable work in this style.

What changes took place in Grand Opéra through the influence of Auber and Meyerbeer?

State the differences between the German, French and Italian opera styles.

Write a sketch of Verdi and his works.

Give an account of Wagner and the works of his first period. His second period.

What was Wagner's theory of the music drama?

Explain the two essential principles he used.

Describe Wagner's later works: "Ring" series, "Tristan und Isolde," "Die Meistersinger," "Parsifal." (Each one may be made the subject of an essay.)

How did Wagner influence opera in Italy and in France?

Give a sketch of the later schools of opera.

LESSON XLI.

PIANO PLAYING AND COMPOSITION: CLEMENTI TO FIELD.

During the period after Mozart to the beginning of the Romantic movement, one name alone attains the first rank—that of Beethoven. At the same time there are several epoch-making pianists, whose compositions display talent rather than genius, but who have each rendered indisputable service in accomplishing the transition from the classic to the romantic composers. The landmarks, so to speak, of this period are Clementi, Cramer, Hummel, Czerny, Moscheles and Field.

=Muzio Clementi= (1752-1832) was born at Rome. His father was quick to perceive his son's gift for music, and strove to develop it by the best teaching available. While he was still a lad, an Englishman, Bedford or Beckford, took young Clementi with him to England where he lived with his benefactor until 1770, perfecting himself in piano playing and composition. At his first appearances in London he created a furore, and from 1777-1780 he conducted at the piano in the Italian opera there. In 1781, he began his travels as a virtuoso. At Vienna he made the acquaintance of Josef Haydn, and also had a sort of musical combat with Mozart. Each read at sight, played his own compositions and improvised. Opinion was divided as to the outcome. Clementi displayed more virtuosity, while Mozart charmed by his singing-tone, finished phrasing and expressive style. For the following twenty years, Clementi lived in London. He became interested in a piano manufactory and when the firm failed, he established another, which is still carried on. In 1802, Clementi went on a concert-tour with two favorite pupils, J. B. Cramer and John Field. They visited Paris, Vienna and even St. Petersburg, arousing great enthusiasm everywhere. In 1810, he settled in London permanently, devoting himself to composition and business. In 1817, he published his _Gradus ad Parnassum_, a series of one hundred studies treating every branch of technic and every problem of piano playing then known.

[Illustration: MUZIO CLEMENTI.]

=Clementi as Composer and Pianist=.—In addition to his early works, Clementi composed symphonies, more than one hundred sonatas for piano, preludes, toccatas, canons and other piano music and finally the _Gradus_. As Clementi was a true Italian by temperament, and German in his education, the sonatas show the influence of Domenico Scarlatti, as well as of Haydn and Mozart. They are technically in advance of their day, though inclined to dryness musically. However, Beethoven admired them, and is said to have preferred them to those of Mozart. Clementi's monumental work, the studies, treats every difficulty and style of piano playing so very comprehensively that it is still indispensable to the student. In his youth Clementi was a bravura-player, pure and simple. "Strong in runs of thirds, but without a pennyworth of feeling" was Mozart's verdict. But later, when Clementi had become acquainted with the larger tone of the English pianos, he cultivated expressive playing. At his best, his brilliancy and facility were dazzling, and he invariably carried all before him. Considering the fundamental value of his studies, and his preëminent abilities as a pianist, it is just to give him the title of "The Father of Piano Playing."

=Johann Baptist Cramer= (1771-1858) was born at Mannheim, Germany. When he was but a year old his father moved to London. As a boy he studied the violin and the piano, as well as the theory of music, but soon showed the greater aptitude for the piano. Later he became a pupil of Clementi. Handel, Bach, Scarlatti, Haydn and Mozart were the objects of his attention, thus establishing a taste for the classics. In 1788, Cramer began a series of tours on the Continent, living at London in the intervals. In 1828, he founded the music publishing firm of J. B. Cramer & Co. He lived in Paris from 1832 to 1845, but returned to London, where he remained until his death.

=Cramer as Composer and Pianist=.—Of Cramer's numerous compositions, such as seven concertos and one hundred and five sonatas for the piano, besides variations, rondos, fantasias, etc., a quartet and quintet, little is worth survival. His representative work is a series of seventy-six studies, Op. 50, to which he afterwards added. These studies long enjoyed a reputation second only

to those of Clementi. They do not aim primarily at virtuosity, but towards the cultivation of musical style; at the same time they exhibit novelty of technical invention, and demand a decided proficiency. Thus they tend to supplement the studies of Clementi which are chiefly concerned with technic. As a performer, Cramer was greatly admired for his perfect legato, distinctness of phrasing and quiet singing tone. Beethoven is said to have preferred him to all other pianists of his time. While Cramer does not present a technical advance over Clementi, he undoubtedly did much for the cultivation of the more strictly musical qualities and thus stands for a definite progress.

[Illustration: J. B. CRAMER. J. N. HUMMEL.]

=Johann Nepomuk Hummel= (1778-1837) was born at Presburg, Hungary. His father, who had been instructor in music at a military school in Wartburg, moved to Vienna in 1786 to become director at the theatre of Schikaneder, (the author of the libretto of Mozart's opera "The Magic Flute"). Mozart soon took so deep an interest in young Hummel that he took him to live with him and taught him for two years. From 1788 to 1795, Hummel traveled as a virtuoso. On returning to Vienna he studied composition with Albrechtsberger, and received advice from Salieri and Haydn. From 1804 to 1811 he was music-director under Prince Esterhazy, Haydn's patron. In 1816, he became conductor at Stuttgart, and in 1819 he occupied a similar position at Weimar. From here he went to Russia, where he made a successful concert-tour, playing at Warsaw, where the youthful Chopin heard him. From 1825 to 1833 he traveled on concert-tours, returning to Weimar, where he passed the remainder of his life.

=Hummel as Composer and Pianist=.—Hummel's compositions include operas, ballets, masses and other church music, a quintet, trios, rondos, studies and other music for the piano, but he is best known for the piano concertos in A-flat, A minor and B minor, the sonatas in F-sharp minor and D major, the Septet, Op. 74, and a voluminous instruction-book for the piano, chiefly remarkable for its pedantry and absence of practicality. As a pupil of Mozart, he followed his teacher's form and style, without exhibiting marked creative genius. His technic is noticeable chiefly for its superficial glitter of brilliant passages, which constitute a certain development in themselves. His compositions were in great vogue at one time, and he was once even regarded as the equal of Beethoven. As a pianist, Hummel was unusual. His style was distinguished by precision, clearness, and command of brilliant effect. His influence as a concert pianist was very great, and in this direction his extension of the province of the virtuoso is considerable. He undoubtedly affected Chopin's piano style for a time and for this reason alone should claim our attention.

=Carl Czerny= (1791-1857) was born at Vienna. His father, an excellent musician, taught his son piano playing at an early age. Beethoven became interested in him, and gave him lessons. He also learned much from Hummel and Clementi. Czerny soon became in great demand as a teacher. He made concert-tours to Leipzig, Paris, London and Lombardy. For the most part he lived quietly in Vienna, teaching and composing. In 1850, his health gave way from overwork. His most celebrated pupils were Franz Liszt and Theodore Leschetizky.

=Czerny's Compositions=.—Czerny was an indefatigable and over-fluent composer who weakened his powers by over-productivity. Hence, of more than a thousand works, his masses, requiems, symphonies, overtures, chamber-music, etc., are obsolete, but his educational works are destined to live. Of many valuable sets of studies, the most used are those for Velocity, Op. 299, and Finger Training, Op. 740. Musically, they are of slight importance, but they are invaluable to this day in acquiring facility. Czerny had an immense knowledge of the higher mechanism of piano playing, and a keen perception of practical methods. His fame as a pianist was overshadowed by his ceaseless work as teacher and composer.

[Illustration: CARL CZERNY.]

=Ignaz Moscheles= (1794-1870), described as "the foremost pianist after Hummel and before Chopin," was born at Prague. He studied the piano with Dionys Weber, director of the Prague Conservatory, and at fourteen played a concerto of his own in public. After the death of his father, he went to Vienna to make his way as a teacher, and to continue his studies in composition. He soon became in great demand as a pianist and teacher, and for ten years lived the life of a traveling virtuoso. In 1824, he gave lessons to Mendelssohn, then a boy of fifteen, at Berlin. Soon after his marriage at Hamburg, in 1826, he went to London, where he remained with some interruptions for nearly twenty years of activity as pianist, teacher and conductor. In 1845, he took the post of teacher of the piano at the Leipzig Conservatory, founded by Mendelssohn.

[Illustration: IGNAZ MOSCHELES.]

=Moscheles as Composer and Pianist=.—As a composer, Moscheles was divided between his classical training and his unmistakably romantic instincts. Hence, a long list of variations, fantasias, rondos, written to please publishers, in accordance with

the fashion of the time, have not survived, but his best works, the concerto in G minor, the “Pathetic” concerto, the sonata, Op. 49, his duet for two pianos, “Hommage á Handel” and especially the studies, Op. 70 and 95, combine a respect for classic form with the growing Romantic movement. The studies may be regarded as the legitimate successors to those of Cramer, and paved the way for the more romantic etudes of Chopin. Moscheles was a solidly trained pianist of great brilliancy. He had many characteristics of the classical school; he used the pedals sparingly, he played octaves with a stiff wrist, his phrasing was precise and his accents were sharply marked; but in the brilliant style he had no rivals. He was famous for his improvisations; his cadenzas to concertos and his extempore treatments of well-known themes were marked by spontaneity, brilliance and exquisite feeling.

=John Field= (1782-1837), one of the last connecting links between the Classical and Romantic schools, was born at Dublin. Early in life, he was taken to London and apprenticed to Clementi, who gave him lessons, and employed him to show off his pianos. In 1802, he went on a concert-tour with Clementi to Paris, Germany and Russia. Field lived for many years as pianist and teacher at St. Petersburg and Moscow. After returning to England, he made a long tour through Belgium, Switzerland, and finally, Italy, where his health gave way. Shortly after he returned to Moscow, where he died.

=Field as Composer and Pianist=.—Field’s compositions in classical forms include seven concertos, four sonatas, rondos, variations, etc. They are forgotten now, although Chopin had a partiality for his concerto in A-flat and gave it to his pupils; but his lyric pieces for piano, entitled nocturnes, are still played. They are the forerunners of the type so extended and developed by Chopin. He is thus one of the first of the romanticists in spite of his classical training. In 1802, Field astonished the Parisians by his masterly playing of Bach and Handel, but his individuality later took a more romantic turn. His tone was tender and melancholy, and his phrases gently expressive. Shortly before his death, though broken in health, he created a stir in Vienna by his interpretations of his own nocturnes. In some respects his playing was akin to Chopin’s highly individual style.

=To sum up=, it will be seen that Clementi was the originator of a system of technic that has served as the foundation of modern piano playing; Cramer was the conserver of classic style and purity of standard; Hummel, as a brilliant pianist, had a decided influence on the piano playing of his time, but as a composer attempted to pass superficial brilliance for the true coin of musical substance; Czerny, one of the greatest educators in the history of piano playing, has had an immense influence through his invaluable educational works, and as the teacher of Franz Liszt, the epitome of modern piano playing, and also of Theodore Leschetizky, possibly the foremost teacher of the present day; Moscheles, the classic pianist, gave decided impetus to the cause of romanticism by his best compositions; Field, though the pupil of Clementi, prepared the way through his own individuality for the greatest piano composer of the Romantic period, Chopin, and thus became an important factor in the transition from the Classic to the Romantic period.

QUESTIONS.

What composers form the transition from the Classic to the Romantic school?

Give a summary of this transition period.

Give a sketch of Clementi.

What was Clementi’s greatest work?

What were his contributions to piano playing?

Give a sketch of Cramer.

What work is most representative of Cramer as a composer?

Mention his contributions to piano playing.

Give an account of Hummel's life.

What classic pianist was a pupil of Mozart?

What was his influence on piano playing?

Give a sketch of Czerny's career.

Who were Czerny's most famous pupils?

What influence did he exert on piano playing?

Give a sketch of Moscheles' life.

What composer was the intimate friend of Moscheles?

What is the value of his educational works?

Give a sketch of Field's career and his influence on piano playing.

What form did Field originate?

[Illustration: FRANZ PETER SCHUBERT.]

LESSON XLII.

FRANZ PETER SCHUBERT.

The rise of the Romantic school involves a greater freedom in form, a fuller play of poetry and imagination, a general artistic evolution and independence in comparison with the formality of the Classic period. The struggle to establish these principles was long and obstinate, but the outcome was as inevitable as the victory won by Beethoven's sonata and symphonic forms over the more primitive types of Haydn and Mozart. The first departures from the classic attitude were made by Schubert, whose influence has been permanent in the development of romanticism.

=Schubert's Early Life= (1797-1816).—Franz Peter Schubert was born in a suburb of Vienna, January 31, 1797. At an early age he had lessons on the violin from his father, who was a school teacher, and on the piano, from his elder brother. He so quickly outstripped both teachers that he was sent to Michael Holzer, choir-master of the parish, who taught him piano, organ, violin, singing and theory. In later years, Holzer disclaimed the value of his instruction, saying: "If I ever wished to teach him anything new, I found he had already mastered it." After singing in the parish choir, he passed an examination for admission to the Imperial _Convict_ or school for the Royal choristers. The training included general education as well as music; there was also an orchestra among the boys in which Schubert played the violin and sometimes conducted. There were privations connected with life at the _Convict_, the practice rooms were insufferably cold, and the food insufficient. In 1810, Schubert began to compose, dating his pieces carefully, and the only check to his inspiration was the lack of music-paper, which he was too poor to buy. A generous friend made up the deficiency. In 1813, he left the _Convict_, although his general education was by no means complete, since he had neglected his studies on account of his increasing passion for composition. After leaving the _Convict_, Schubert taught elementary classes at his father's school, but the drudgery became insupportable. An ardent friend and admirer, Franz von Schober, realizing that Schubert's creative powers were greatly hampered by the conditions of his life, gave him a home. Already he had composed some of his most famous songs, including "The Erl-King."

=Later Years= (1816-1828).—From 1816 on, Schubert appears to have lived in Schober's apartments, except for two years shared with the poet Mayerhofer, and a period spent with a friend, Schwind. It is a mystery how Schubert managed to live, for he taught little, and his few publications could have brought him at best only small sums at irregular intervals. He had already failed to secure a position in a Government school of music, but in 1818 he passed the summer as music teacher to the household of Count Johann Esterhazy, in Zelescz, Hungary. The record of his life hereafter is one of incessant composition, with few interruptions or facts of interest. In 1823, he showed Weber his eighth work for the stage: "Alfonso and Estrella." The only advice he received was that "first operas, like first puppies, should be drowned." The summer of 1824 was spent again with the Esterhazys and many characteristic compositions, such as the quartet in A minor, the "Hungarian Divertissement," the piano sonata in B-flat, etc., date from this time. In 1826, Schubert failed to obtain either of two positions, which would have placed him above need, the second because, like

Beethoven, he refused to alter a trial aria to suit the voice of a capricious singer. Schubert was taken to see Beethoven during his last illness, in 1827. In 1828, he went to live with his brother Ferdinand in a new and damp house. His health, which had been troublesome before, now gave way, and he died of typhoid fever, November 28, 1828, in his thirty-second year.

=Personal Traits and Habits of Work=.—Schubert was short of stature, thickset and rather heavy in features. His face in repose was rather devoid of expression, but when interested in anything, his eyes glowed with enthusiasm and his whole appearance changed. His disposition was even and good-tempered, he was simple and trusting by nature, and could rarely be induced to put himself forward. Although receiving many favors from friends, his generosity often led him to give to others when he could ill spare it. He began composing early in the morning and worked uninterruptedly for several hours; he walked much in the afternoon or paid visits to friends, spending his evenings with congenial spirits at various taverns. Composing was the mainspring of his existence, and he often wrote down his ideas while in the midst of conversation with others. Thus he wrote his immortal “Serenade” on the back of a bill-of-fare at a tavern; a piece for four-hands while waiting at a hospital for a friend, “and dinner missed in consequence”; a movement of a string quartet was begun about midnight and finished in the early morning. Although he set many poems by Goethe, Schiller and Heine, his inspiration was quite as effectively aroused by second-rate poems of his friends Mayerhofer, von Schober, or the artless poems of Müller. Schubert was shy and reserved in what might be called “good society”; he preferred the company of congenial friends in an humbler social station. He seems to have cared little for literature, and his love of poetry was limited to its availability as texts for songs. In early life he played the violin and the viola in a family string quartet. Schubert was no virtuoso on the piano, but he played exquisite accompaniments, and he read well at sight in spite of defective eyesight. His performance was marked by earnestness and attention to the inner sentiment of the music rather than by the superficial polish of the mere pianist. It was said that no one could forget the effect of Schubert’s songs as performed by himself and his friend Vogl; the two seemed absolutely united, the ideal condition for the rendering of vocal works.

=Schubert’s Compositions=.—Schubert completed more than eleven hundred pieces in about eighteen years. Such fertility is unique in the history of composition, and is scarcely equalled even by Mozart, whose activity extended over nearly thirty years. Schubert’s powers of spontaneous invention have never been approached; he composed generally without making sketches; he seldom revised, for his ideas came faster than he could write them down. It is impossible to enumerate all Schubert’s works, but the following comprise the most important: Nine symphonies, eleven works for the stage, six masses, over seventy part-songs, choruses, etc., for various combinations, twenty-four sonatas for piano, fantasies, overtures, variations, marches and dances for piano duet, impromptus, moments musicals, fantasies, variations and over two hundred dances for piano solo, two trios for piano and strings, a quintet for strings and piano, a string quintet and several string trios, twenty-four string quartets, besides about six hundred songs with piano accompaniment and occasionally with obligatos for other instruments. It is obvious that such fertility is not consistent with evenness of quality; we must pick and choose to find the real Schubert. However, the symphonies in C and B minor (“Unfinished”), the string quartets in D minor and G major, several sonatas for piano, the impromptus, moments musicals, the fantasy in C for piano, the Hungarian Divertissement, several marches and other compositions for four hands, many charming two-hand waltzes, and, finally, such song-cycles as the “Miller-Songs,” the “Winter Journey,” those called “Swan-Songs” by the publishers, as well as about thirty separate songs “The Erl-King,” “The Wanderer,” “To Sylvia,” “The Omnipotent,” “The Young Nun,” the “Serenade,” “Hark! Hark! the Lark,” “Sei mir Gegrüsst,” “Du bist die Ruh,” “Ave Maria,” “Litany,” and others, are the works of Schubert which will live. Schubert at his best entrances us by his wonderful flow of melody, his spontaneity, his symmetrical form, which, however, is sometimes diffuse. His chief qualities lie in the simple expressiveness of his music, a direct appeal to sincerity of emotion, and to the sense of the poetic. He began by imitating the form and style of Mozart and Beethoven; but from his eighteenth year onward he developed an individuality entirely apart. Despite the virtues of his instrumental music, his great achievement was the creation of the German song, in which department he stands unrivalled in the inexhaustibility of his melody, the variety of mood which they display, the subtlety and harmonic beauty of his accompaniments, as well as art in creating vocal effects.

=Schubert’s Influence on Music=.—In abundance of resource, poetic feeling and true imagination, Schubert has brought new forces into music. His influence on romantic composers was widespread and deep. Schumann was a thorough admirer of Schubert. Schumann’s songs could hardly have come into existence but for those of Schubert, and the latter’s short pieces for piano were undoubtedly as potent an inspiration for his piano works. Brahms, too, had a real reverence for Schubert, that is plainly exhibited in his works. Despite the differences of their artistic individuality, there are traces of Schubert in the former’s songs as well as in some of his short piano pieces. Liszt’s partiality to Schubert was untiring in its zeal. He played his piano music, transcribed the “Hungarian Divertissement,” arranged some of the marches for two hands and for orchestra; he made a version of the fantasy in C for piano and orchestra, which is still popular; and, finally (perhaps his greatest service to Schubert) he transcribed no less than

fifty-seven of his songs for piano. In this form he created an interest in Schubert where the original versions were unknown, and did much to spread their renown. In spite of all shortcomings, Schubert's genius was so remarkable, and his immediate effect upon the Romantic movement so apparent and his legacy to the musical world so imperishable that it is difficult not to agree with Sir George Grove when he wrote: "There has never been one like him and there never will be another."

QUESTIONS.

From what rank in life did Schubert come?

Give the leading incidents in his life.

What kind of man was he physically, mentally and socially?

How did Schubert compose?

In what forms of composition did Schubert work?

What form of composition did he especially enrich?

Which of his productions have the greatest vogue today?

What influence did Schubert exert on music?

Who did much to spread a knowledge of his works?

Name some composers who have felt his force.

LESSON XLIII.

WEBER. MENDELSSOHN.

Schubert's operas had no appreciable effect on the Romantic composers, for the simple reason that they were never heard on account of the absurdities of their librettos and the weakness of their stage situations. At about the same period, a slightly older composer was beginning a series of works destined to place German Opera on a firm basis, to exercise a decided influence on Wagner, besides contributing not a little to the development of piano technic.

=Carl Maria Friedrich Ernst von Weber= was born at Eutin, December 18, 1786. His father, a restless man of many talents, was a theatrical manager during Weber's early years, when constant traveling was the rule, and music lessons the exception. His irregular early instruction under several teachers, of whom Michael Haydn was the most eminent, was supplemented by two years of solid study under the gifted and eccentric Abbé Vogler. From 1804 to 1806, Weber was music-director at the Breslau theatre, and soon made a name for himself as composer and pianist as well as conductor. After this he remained under the protection of the Duke of Wurtemburg, earning a living by giving lessons, and acting as secretary to the Duke's brother. During this period he composed an opera "Silvana," overtures, a cantata, piano music, etc. Three years of wandering, chiefly on concert tours, ensued after his banishment from Wurtemburg on account of unjustly suspected complicity in an intrigue for a position at court. To these years belong a comic opera, "Abu Hassan," the piano concertos in C and E-flat, three concertos for clarinet, the piano sonata in C, etc. In 1814 and 1815, he composed the choruses, "Lyre and Sword," and a cantata, "Battle and Victory," both the outcome of political events, and widely popular from their patriotic character. In 1816, he became music-director of the German opera at Dresden. He revived interest in German opera, stimulated public support and in the following years began the composition of "Der Freischütz," an opera thoroughly German in its character and the keystone of Weber's fame. It was not finished until 1820, for in the

meantime he wrote much of his best piano music, songs and incidental music for a gipsy play “Preciosa.” Just after the completion of his popular Concert-piece for piano and orchestra, “Der Freischütz” was given for the first time at Berlin, June 18, 1821, and the result was one of the greatest triumphs ever bestowed on a German composer. It was soon given in all the principal theatres in Germany, including Dresden, and also in Vienna. In 1823, Weber’s most ambitious opera, “Euryanthe,” was given in Vienna and proved almost a failure. Weber’s health, which had not been satisfactory for some years, showed signs of being undermined. “Euryanthe” was performed with greater success during 1824 and 1825, at Dresden, Leipzig and Berlin, where Weber was almost too ill to conduct. In spite of his ill-health he agreed to write an opera for the Covent Garden Theatre, in London, beginning the music to “Oberon” early in 1825 and finishing the last number in the spring of 1826. The performances were more than satisfactory, and Weber was received everywhere with enthusiasm. His strength was now entirely overtaxed, and he hoped to return to his family, but he died suddenly from consumption, on June 4, 1826.

=Weber’s personality= was pleasing; of excellent birth, his experience of the world through his positions as opera-director and his frequent concert-tours, made him an agreeable companion and a favorite in society. He was cultivated, well read in philosophy and science; he possessed considerable literary and critical ability. In consequence of his intellectual and social gifts, he was a new type of musician, who did much to improve the social status of the composer. He was a remarkable pianist, with an immense command of technic, original in style and eloquent in expression; also a forceful conductor.

=Weber the Composer=.—Weber is, first of all, the composer of the three operas, “Der Freischütz,” “Euryanthe” and “Oberon,” which are discussed in Lesson XXXVII. The overtures to his operas are his best orchestral works; his symphonies and chamber-music are unimportant. However, his three concertos for clarinet and orchestra are classics in the literature of that instrument. Weber’s songs are interesting for the sidelight they throw on the development of the Folk-song tendency, but in this line he was entirely overshadowed by Schubert and Schumann. However, Weber’s piano music is exceedingly important. The concertos for piano are seldom heard, but the “Concert-piece” is still amply worth study. The piano sonatas (especially those in C and A-flat) show great technical inventiveness, melodic charm and original effects, but they are less happy in point of form. Next to the sonatas in interest comes the delightful Op. 65, “Invitation to the Dance,” so well-known in Berlioz’ orchestral version. In addition are the “Momento Capriccioso,” Op. 12, the Rondo in E-flat, Op. 62, the “Polacca Brillante,” Op. 72, the Polonaise, Op. 21. Weber did much to develop the technic of the left hand; his piano compositions are thoroughly pianistic and rank high in the music of the Romantic period.

=Weber’s Influence=.—Weber’s position in the evolution of the Romantic school is extremely important. In Opera his exploration of the imaginative field in so many directions not only opened a new vein in dramatic music, but its influence was felt in every branch of composition. Thus several of Schumann’s choral works, Mendelssohn’s “Midsummer Night’s Dream” music, the “Walpurgis Night” cantata, the concert overtures, and pieces for piano and orchestra are direct musical descendants of Weber. Mendelssohn’s Concerto in G minor, the “Serenade” and “Allegro Giojoso,” his scherzos and “Songs Without Words” are the direct outcome of Weber’s example. In general, the technical style of Weber’s piano music was thoroughly absorbed by both Mendelssohn and, to some extent, Liszt, who edited Weber’s sonatas and solo pieces with tempting additions; he transcribed for piano the overtures “Jubilee,” “Freischütz” and “Oberon,” and arranged the “Polacca Brillante,” Op. 72, for piano and orchestra. Liszt was very fond of Weber’s music, his piano style was sympathetic to him, his interpretation of the Concert-piece, Op. 79, never failed to produce an overwhelming effect. Finally, Weber’s influence on Wagner must be mentioned. Wagner greatly admired Weber’s dramatic insight, his picturesqueness, and especially the poetry and novel color of his orchestral style.

MENDELSSOHN.

The influence which Mendelssohn exercised during two-thirds of the 19th century among the more conservative German musicians and in England was nothing short of extraordinary. He undoubtedly gave great impetus to the study of the classic masters, especially Bach, and his romantic tendencies were so balanced and controlled as to gain a speedy recognition for his music. Today, Mendelssohn the classicist is less admired, and his music will live chiefly for its romantic qualities.

=Mendelssohn’s Life=.—Jakob Ludwig Felix Mendelssohn-Bartholdy[15] was born at Hamburg, February 3, 1809. His father, a prosperous banker, moved to Berlin in 1811. His first lessons in music were given him by his mother, but he soon began to study the piano with Ludwig Berger, a pupil of Clementi, and composition with Zelter. In 1820, he began to compose systematically. In 1821, he made the acquaintance of Weber, and his enthusiasm for the romantic composer lasted all his life. In 1824, he formed a life-long friendship with Moscheles, who gave him piano lessons. Already he was remarkable for his improvisations and for playing from scores. In 1825, a trip to Paris brought him into contact with the celebrated musicians there. In this year he composed his octet

for strings, in which his individuality first asserted itself strongly. In the following summer he wrote the overture to “A Midsummer Night’s Dream,” a precocious evidence of originality. In 1827, he made the first draft of his overture “A Calm Sea and a Prosperous Voyage,” a further step into the realm of imagination. In 1829, he organized the first performance of Bach’s “St. Matthew Passion” music since the composer’s death. In this year a visit to England, where some of his compositions were performed, was followed by a trip to Scotland, the Hebrides and Wales, of which his impressions are recorded in the “Hebrides” overture, the “Scotch” symphony and other works of later years. He traveled much during the following years. In 1833, after another visit to England, where his recently composed “Italian” symphony was played, he conducted a musical festival at Düsseldorf, the first of many similar engagements. During the next few years he was constantly employed in conducting, playing and composing, especially his oratorio “St. Paul.” In 1837, he married Miss Cécile Jeanrenaud. From this time dates his second piano concerto in D minor, in which are to be seen traces of Thalberg’s piano style. During the next few years Mendelssohn lived at Leipzig. In 1843, he established a conservatory at Leipzig, long the most celebrated in Europe. Schumann, and later Moscheles, were among the teachers as well as Mendelssohn himself. In 1846, Mendelssohn’s oratorio “Elijah” was given a triumphant first performance at Birmingham under the composer’s direction. In 1847, he made his tenth visit to England for performances of “Elijah,” of his completed “Midsummer Night’s Dream” music (composed in 1845), the “Scotch” symphony and other works. The death of his sister, Fanny, following soon after those of his parents, was so great a shock to him that he went to Switzerland for a rest. He returned improved in health, but could not consider commissions for new works from England, Frankfort and Cologne. He was considering a trip to Vienna to hear Jenny Lind sing in “Elijah” when he was taken suddenly ill and died, November 4, 1847.

=Personal Traits=.—Mendelssohn is described as having an unusually animated, winning personality. He was immensely fond of society, which he could enjoy without detriment to his work. His letters describe in detail his innumerable professional engagements, his round of social festivities and his journeys with equal fidelity. Mendelssohn was fond of out-of-door life, walking, riding and swimming; he also greatly enjoyed dancing. One of his favorite relaxations was to sketch from nature or paint in water-colors. Mendelssohn was a remarkable pianist, of an unaffected type, not a virtuoso, yet his interpretations were full of vigor, charm and a thoroughly musical spirit. His improvisations were remarkable for their spontaneous invention, brilliance and science displayed, and his cadenzas to Beethoven’s 4th concerto and Mozart’s, in D minor, were striking examples of his skill. Mendelssohn was also a remarkable organist, if English testimony is to be credited. At all events, he did much to further the knowledge of Bach’s organ works. Mendelssohn’s incessant activity undoubtedly hastened his death; the amount that he compressed into his short life was incredible.

=Compositions=.—The works most representative of Mendelssohn are the “Scotch” and “Italian” symphonies, the overtures “A Calm Sea and a Prosperous Voyage,” “A Midsummer Night’s Dream,” “The Hebrides,” “Melusina,” “Ruy Blas”; the concertos and two smaller pieces for piano and orchestra; the concerto for violin; the octet for strings; two quintets and seven quartets; three quartets for piano and strings; two trios; two sonatas for piano and ’cello; for the piano, six preludes and fugues; three sonatas; the “Serious Variations”; six books of “Songs Without Words”; many smaller pieces, including the “Capriccio,” Op. 8; the “Rondo Capriccioso,” Op. 14; the Caprices, Op. 33; the Scherzo à Capriccio and others; sonatas, preludes and fugues for organ; the oratorios “St. Paul,” and “Elijah”; music to “A Midsummer Night’s Dream,” to the dramas “Athalie,” “Antigone” and “Œdipus”; the cantata “Walpurgis Night.” He also wrote a great deal of church music, psalms, hymns, motets, and cantatas for various occasions, including the “Lobgesang,” a symphony-cantata; many part-songs, duets and songs for single voice with piano accompaniment.

[Illustration: FELIX MENDELSSOHN-BARTHOLDY.]

=Mendelssohn’s Tendencies=.—Although he wrote almost exclusively in the conventional forms, Mendelssohn cannot be regarded as a continuator of the classics. In form, thematic development, counterpoint, part-writing, etc., he imitated the letter of classic example closely, but could not attain the inner spirit. To some extent he followed Bach, Handel, Mozart and Beethoven, but the chief source of his individuality is the romanticism of Weber. His piano style is adapted from that of Weber with some extensions of his own. Showered with praise as he was during his lifetime, as the possessor of all the classic virtues, we now admire him chiefly for his romanticism, timid and fastidious though it appears by comparison with the genuine innovations of Berlioz, Liszt and Wagner. In the light of the sturdy qualities of Brahms, his classicism seems superficial. His style was too polished to admit of real vigor. Nevertheless, Mendelssohn of the two symphonies, the “Midsummer Night’s Dream,” “Melusina” and “Hebrides” overture, the violin concerto, the piano concerto in G minor, the sonata for piano and ’cello in D, the scherzo of the octet, the “Serious Variations,” the Scherzo à Capriccio and some half a dozen of the “Songs Without Words” shows us a delicate and charming individuality with the refinement and decided perceptions of the poet, who regarded the world with the eyes of a romanticist recording many impressions of picturesqueness and grace, if seldom of strength.

=Mendelssohn's Influence as an Artist=.—For a time, Mendelssohn's influence was unbounded. His symphonies and overtures were considered worthy successors to those of Beethoven; his chamber-music was equally valued; his oratorios were regarded as on a level with those of Handel; his piano music, especially the "Songs Without Words," were in universal vogue. His orchestral style contained many novel features, it is true, but his chamber-music was not written in the genuine manner and is far inferior to that of the later master, Brahms. His oratorios contain some notable choruses and airs, but on the whole are only faint imitations of the real oratorio style. Still they sufficed to form the foundation of an English school of composition in this form. His piano music contains much that is trivial, but at its best undoubtedly did something to prepare the way for the deeper romanticism of Schumann, Chopin and Liszt. His songs also have far less variety of mood and lyric inspiration than those of Schubert and Schumann, but they too acted as prophets of the more vital creations to follow.

That this reverence for Mendelssohn was no mere infatuation of the moment but a sober respect can best be judged from the diversity in nationality and temperament of those who came under his influence: Gade, the Norwegian; Sterndale Bennett, the English composer and pianist; Hiller and Reinecke among the Germans, and Rubinstein from Russia. These names constitute but a small proportion of Mendelssohn's disciples, his personality dominated musical England in every branch of composition for many years; and English composers are only just beginning to throw off the yoke of adherence to the traditional oratorio form as exhibited in "St. Paul" and "Elijah." Schumann admired Mendelssohn without reserve and without a suggestion of jealousy, although the tide of popular favor neglected him for his more easily understood contemporary. Today, criticism has swung possibly too far in the opposite direction, and Mendelssohn suffers from depreciation.

QUESTIONS AND SUGGESTIONS.

Mention the significant events in Weber's life.

Describe Weber the man.

Sketch the work of Weber as a composer.

Show the influence of Weber upon music.

Name some of Weber's best-known piano works.

What composers were greatly influenced by Weber?

Give an account of Mendelssohn's boyhood, manhood.

What educational work in music did Mendelssohn originate?

In what lines of musical work did Mendelssohn excel?

Name representative compositions of Mendelssohn.

What composers did Mendelssohn follow?

What influence did Mendelssohn exert on music?

For students who wish to study Weber's characteristics, the Momento Capriccioso, Op. 12, the "Invitation to the Dance," Op. 65, the piano sonatas in C and A-flat are the most representative, while the overtures to "Der Freischütz," "Euryanthe" and "Oberon" show his style as a dramatic composer.

The following suggestions may aid the student in his study of Mendelssohn's works: The "Italian" and "Scotch" symphonies, the "Midsummer Night's Dream," "Hebrides" and "Melusina" overtures, the Nocturne and Scherzo from the "Midsummer Night's Dream" music, the violin concerto, the concerto in G minor and the Capriccio Brillante for piano and orchestra, the pieces for piano, Op. 7, Nos. 3 and 7, the Rondo Capriccioso, Op. 14, the Caprice, Op. 16, No. 2, the Prelude and Fugue, Op. 35, No. 1, the Serious Variations, Op. 54, the Scherzo à Capriccio without opus number, and the following "Songs Without Words," Op. 19, Nos. 1, 2, 3, 6; Op. 38, Nos. 2, 3, 5; Op. 62, Nos. 3, 6; Op. 67, No. 4, and Op. 102, No. 3. Liszt has made an exceedingly effective transcription of Mendelssohn's song "On the Wings of Song," which is a popular concert number today.

LESSON XLIV.

ROBERT SCHUMANN.

=The Romantic Movement before Schumann=.—Schubert gave a decided impetus to the Romantic movement through his spontaneous melody and deep fund of imagination. He infused poetry into the classic forms, his piano works in the small forms showed the way to future achievement in these lines, but especially he founded German song, which had scarcely been hinted at by Mozart and Beethoven. Although Weber extended the province of piano technic, and exhibited further possibilities of romantic feeling in combination with the rondo and sonata forms, his chief work was the realization of German opera, elsewhere described. But still another German was destined to contribute richly to romantic piano literature, to prove no mean successor to Schubert in the province of song, and to add further proofs of his genius in chamber-music, choral works and the symphony.

=Schumann's Early life=.—Robert Alexander Schumann was born at Zwickau, in Saxony, June 8, 1810. His father was a bookseller with some attainments as an author. Schumann's gift for music asserted itself early. He had piano lessons from a local organist at the age of six, and began to compose soon after. A taste for improvisation also developed. For several years his literary interests were as pronounced as those for music. He read assiduously, and was especially devoted to poetry. His general education was continued at the Zwickau Academy, where he studied until 1828. In 1827, he came under the joint influence of the writings of Jean Paul (Richter) the poet and novelist, and of Schubert's music, both of which played an important part in his mental and artistic growth. In 1828, he entered the University of Leipzig with the intention of studying law. He kept up his music, however, and not only became enthusiastic over the clavier works of Bach, but took piano lessons of Friedrich Wieck, a celebrated teacher in Leipzig. In 1829, Schumann went to Heidelberg. Here he continued his law studies in a desultory fashion, but worked with the greatest persistence at piano playing. In 1830, he resolved to study law with more seriousness, but it was intensely repugnant to him, and after some reflection, he determined, with Wieck's advice, to adopt music as a profession. Accordingly, he returned to Leipzig to study the piano with Wieck, but having the misfortune to injure a finger in his zeal for speedy perfection, he was obliged to forego the career of a virtuoso, perhaps to the great gain of music.

=Schumann's Professional Career=.—He now devoted his attention to thorough study of composition with Heinrich Dorn. In 1834, Schumann founded the "New Journal of Music" in the interests of a higher critical standard, and the furtherance of worthy compositions. During ten years of editorship, Schumann found abundant outlet for his literary interests, and his paper exerted a considerable force on public opinion. Two of his greatest piano works, the Carnival, Op. 9, and the Symphonic Studies, Op. 13, belong to the year 1834. During the years 1836 and 1837, he had some intimacy with Mendelssohn. From 1836-39 date most of Schumann's important works for the piano. In 1840, Schumann married Wieck's daughter, Clara, the celebrated pianist, after several years' struggle to gain her father's consent. Schumann's marriage was the turning-point in his artistic career, and his wife's sympathy was a great stimulus to his creative activity. In the year following his marriage, Schumann turned to song-composing, producing more than one hundred songs in this period. In 1841, he gave himself up wholly to orchestral composition, writing his symphony in B-flat, the first draft of his D minor symphony, a third work, afterwards published as Overture, Scherzo and Finale, as well as the first movement of his piano concerto. In 1842, he confined himself almost exclusively to chamber-music, composing three string quartets, the masterly quintet, Op. 44, the quartet, Op. 47, for piano and strings, and a trio. To 1845 belong the "Variations" for two pianos, and a large choral work, "Paradise and the Peri." In 1844, Schumann began the music to Goethe's "Faust," but ill-health interrupted him for more than a year. However, in 1845 he completed the piano concerto, wrote several works for pedal piano, and in 1846 finished his second symphony. In 1847, he began his opera "Genoveva," which was not given until 1850. Late in 1850 he went to Düsseldorf to take a position as director. While here he composed his third symphony. In the following years he wrote several overtures, works for solo instruments and orchestra, the overture and incidental music to Byron's "Manfred," "The Pilgrimage of the Rose" and many other choral works, including a Mass and a Requiem. Early in 1854, symptoms of a mental disorder, which had been increasing of late years, culminated in an attempt at suicide. He passed the remaining years

of his life in an asylum near Bonn, where he died July 29, 1856.

[Illustration: ROBERT SCHUMANN.]

=Schumann's Personality=.—By reason of his two-fold activity as critic and composer, Schumann was a new force in music. Highly cultivated in literature, philosophy and poetry, he possessed a keen and discerning critical taste, and a literary style that was picturesque and eloquent. Schumann was shy and reserved by nature, he talked little but observed and reflected abundantly. He was never fond of society, and as years went by he lived more and more like a hermit, absorbed in composition and family life. For ten years, however, he was in touch with the public by reason of his editorship of the "New Journal," and by his championship therein of all that was good and progressive in the music of the day, did much for the encouragement of true art. His articles on Schubert, Mendelssohn, Gade, Chopin, Berlioz, Liszt, Brahms and others formed a new epoch in musical criticism, and helped the cause of Romanticism immeasurably. No estimate of Schumann's character is complete without taking into account these distinct tendencies as critic and composer. His collected writings give a graphic illustration of his views on music, and form a supplement to his personality as expressed in his music.

=Schumann's Compositions=.—Schumann's most representative works include four symphonies and the "Overture, Scherzo and Finale," the overtures "Genoveva" and "Manfred"; three string quartets, a piano quintet, a piano quartet, three piano trios and two sonatas for piano and violin; the music to "Faust" and "Manfred"; "Paradise and the Peri," "The Pilgrimage of the Rose" and other works for solos, chorus and orchestra; more than two hundred songs; the piano concerto and two smaller works for piano and orchestra, besides a monumental series of works for piano alone. In addition there are duets, part-songs, choruses, pieces for piano duet, a concert piece for four horns and orchestra, a concerto for 'cello and orchestra, a fantasy for violin and orchestra, besides short pieces for oboe, viola, clarinet and 'cello with piano accompaniment, the opera "Genoveva," the overtures "The Bride of Messina," "Julius Cæsar" and "Herman and Dorothea," the Mass, Op. 147, and the Requiem, Op. 148.

It will be seen that Schumann wrote much in the sonata or symphonic form, yet his command of it was far from complete. In this respect and in instrumentation, Schumann was inferior to his romantic contemporary, Mendelssohn. On the other hand, he was far more original and his music has a much greater depth of sentiment, a higher sense of beauty and a noble human breadth that forms one of the highest points in the development of romanticism. What he lacked in technical attainment, he more than made up in beauty of themes, vigor and spontaneity of treatment, and thorough-going romanticism in moods. It is difficult to say which is his best symphony, they all have merits of their own; of the overtures, that to "Genoveva" (almost the only surviving portion of the opera) and "Manfred" are examples of Schumann's ardent romanticism at its best. The string-quartets are not always in quartet style and their structure is sometimes open to criticism, but they are individual and contain much that is beautiful. The piano-quartet is a genial work of great spontaneity that took Europe by storm. It was immediately hailed as the greatest work since Beethoven, although its position might now be assailed by the piano quintets by Brahms and César Franck. The piano quartet, as well as the quintet, is a pioneer in this form of chamber-music, but has not the same flow of melody as the former. The trios and sonatas for violin and piano, although not on a level with the other chamber-music, have nevertheless striking qualities to commend them. Schumann's choral music is decidedly unequal, but the "Paradise and the Peri," and portions of the "Faust" and "Manfred" music display the same breadth of human emotion so characteristic of his best music. In the field of song, Schumann is a worthy successor to Schubert. Schumann's songs have not the inexhaustible melody of Schubert's, but they are richer harmonically, the accompaniments more individual, and the character of the poems more subtly brought out.

=Schumann's Contribution to the Short Piece=.—Perhaps Schumann's most conspicuous service to music lies in his development of the short piece. In this direction he has cultivated a branch of expression, with an originality, a freedom and a richness that have no parallel in the Romantic movement except in Chopin. Mendelssohn undoubtedly did something for the short piece, but his "Songs Without Words" are limited to a few types, while Schumann made the short form serve every variety of expression. He undoubtedly owed much to the examples of Schubert with his waltzes and other dances, the impromptus and moments musicals, but in richness of resource and spontaneity of expression he went much beyond the older master. His piano style is highly distinctive; it does not offer much that is new in finger technic, but in polyphonic treatment of melodies, in striking rhythms and harmonic effects and in original use of the pedal it is remarkable. Both in the sets of small pieces, such as the "Papillons," Op. 2, the "Davidsbund Dances," Op. 6, the "Carnival," Op. 9, or the Flower pieces, Op. 19, and in the Novellettes, Op. 21, the Fantasie pieces, Op. 12, the Symphonic Studies, Op. 15, the Toccata, Op. 7, and the great Fantasy, Op. 17, Schumann displays a wealth of imaginative poetry that makes him one of the greatest romanticists in piano music. His piano works from Op. 2 to Op. 28 are matchless, although the sonatas, Op. 11 and 22, suffer from lack of coherence. The variations for two pianos, Op. 46, and the concerto, Op. 54, are models of their type. The "Album for the Young," Op. 68, the "Forest Scenes," Op. 82, the "Varied Leaves,"

Op. 99, and the “Album Leaves,” Op. 124, are all admirable, and contain a great variety of short pieces, many of which were composed early in his career. Schumann’s songs and piano pieces are the best examples of his contribution to romanticism.

Schubert and Jean Paul Richter (the romantic novelist and poet) were the earliest influences in Schumann’s studies, nevertheless he admired Beethoven greatly, and shut himself up with his quartets as a preparation for his own chamber-music. As a student in Leipzig, he was devoted to Bach’s clavier works, and later in life he renewed his enthusiasm for Bach while writing the works for pedal piano and the piano fugues. Fugal form and romantic sentiment do not go well together, however, and Schumann’s compositions in this form are not his greatest. Schumann’s influence is strongest upon composers of songs and short piano pieces. It would be difficult to name even the most representative, but the most signal example is Brahms, whose songs and piano pieces could hardly exist but for Schumann. In many of the modern Russian composers we find distinct traces of Schumann, as well as among the Frenchmen Gabriel Fauré and Vincent d’Indy, the German Adolf Jensen, the Italian Sgambati, and many others.

=Compositions Suggested for Study=.—The symphonies, overtures, the chamber-music and the larger choral works are all characteristic of Schumann at his best, but for more detailed study of his piano music and songs the following are suggested. Of the piano works, the “Papillons,” Op. 2; the “Paganini Caprice,” Op. 3, No. 2; the “Davidsbund” dances, Op. 6, Nos. 1, 2, 4, 5, 7, 9, 11, 12, 16, 17, 18; the “Toccata,” Op. 7; the “Carnival,” Op. 9; the Sonata, Op. 11, especially the “Aria” and “Scherzo”; the “Fantasy Pieces,” Op. 12, entire except the “Fable”; the “Symphonic Studies,” Op. 13; the “Scenes from Childhood,” Op. 15, Nos. 1, 2, 4, 5, 7, 9 and 13; the “Kreisleriana,” Op. 16, Nos. 1, 2, 3, 4, 5 and 8; the “Arabesque,” Op. 18; the “Flower Pieces,” Op. 19; the “Humoreskes,” Op. 20; the “Novellettes,” Op. 21, Nos. 1, 2, 3, 4, 5, 7 and 8; the Sonata, Op. 22; the “Night Piece,” Op. 23, No. 4; the “Carnival Prank,” Op. 26, Nos. 1, 2, 3 and 4; the “Romance,” Op. 28, No. 2; the Variations for two pianos, Op. 46; the Concerto, Op. 54; the “Album for the Young,” Op. 68; “The Happy Farmer,” “May, Lovely May,” “First Loss,” “Small Romance,” “Remembrance,” November 4, 1847 (the date of Mendelssohn’s death); “Canonic Song,” “Theme,” two pieces without name, “Northern Song”; Op. 76, Nos. 1, 3 and 4; “Forest Scenes,” Op. 82; “Entrance,” “Lovely Flower,” “Inn,” “Bird as Prophet,” “Hunting Song,” “Elves”; Op. 99, Album Leaf, and Novellette; “Album Leaves,” Op. 124, Nos. 1, 2, 3, 4, 10, 13, 15 and 17. Of the songs: “Dedication,” “The Nut Tree,” “The Lotus Flower,” “Highland Cradle Song,” “Two Venetian Songs,” “Thou Art like a Flower,” and “Conclusion,” “The Boy with the Magic Horn,” “To the Sunshine,” “Forest Dialogue,” “Moonlight,” “Spring Night,” “Woman’s Love and Life,” “Spring Journey,” “In the Wondrous Month of May,” “From My Tears,” “The Roses, the Lily,” “When I Look into Thine Eyes,” “I Grudge it Not,” “The Two Grenadiers,” “Folk-Song.”

QUESTIONS.

Who represented the Romantic movement prior to Schumann?

Give the important events in Schumann’s early life.

Give the important events in Schumann’s professional career.

Give an account of Schumann as a man and as a critic.

How did Schumann help in musical progress?

What composers influenced him in his development?

In what forms did Schumann write?

Name representative works in the different forms.

What contribution did Schumann make to the development of the short piano piece?

What composers did Schumann influence?

[Illustration: FREDERIC CHOPIN.]

LESSON XLV.

FREDERIC CHOPIN.

=Schumann and Chopin=.—Among Schumann's many able reviews of new music, showing the keenest critical insight, none exhibit a more just appreciation of an original talent than his article on some variations by a young composer who was destined to exert so deep and widespread an influence on piano style and piano composition. Chopin's romanticism, somewhat affected at first by both Hummel and Field, is one of the most individual developments of the entire period.

=Chopin's Early life=.—Frederic Chopin was born at Zelazowa-Wola, near Warsaw, in Poland, on March 1, 1809. His father, who had served in various positions as a teacher, finally established a boarding-school in Warsaw. Chopin showed great sensitiveness towards music at an early age. His first lessons on the piano were given him by a Polish teacher of some celebrity, Adalbert Zwyny. He soon became famous as a pianist, and from the age of nine, played constantly at the houses of the nobility, and was eagerly received by them. In 1824, he entered the Warsaw Lyceum in order to pursue his general studies. About the same time he began lessons in composition with Elsner, who had a high reputation as a teacher. He had already composed pieces for the piano on his own account, and continued with such success that as early as 1825 his Op. 1, a Rondo, was published. In 1827, he left the Lyceum, and gave thereafter all his time to playing and composing. Soon after, he made great strides in composition, and many of his studies and smaller pieces, as well as his two concertos, belong to this period, or were begun then. Early in 1829, Hummel played in Warsaw, and the influence of his piano style is evident in the works of Chopin for some time to come. Later in this year, Chopin went to Vienna, where he gave two concerts, winning instant recognition both as pianist and composer. After his return to Warsaw he continued to compose much.

=Chopin's Manhood=.—A second visit to Vienna occurred toward the end of 1830. He gave concerts, came into contact with many musicians, and even found time to compose; but being dissatisfied with conditions in Vienna, determined to go to Paris. Early in 1831, after giving concerts on the way, he arrived at Paris, which was henceforth to be his home. Here he was soon thrown with many of the leading musicians, his playing caused an immediate sensation, and as at Warsaw, he was welcomed in the most exclusive society. In 1832, he began to acquire fame as a piano teacher, especially of pupils from the aristocracy. From 1833 to 1835, his compositions began to appear, and gained him much approval as a composer. In 1835, he went to Leipzig, where he saw Wieck and his daughter, afterwards Clara Schumann, Mendelssohn and Schumann. In 1837, he met Madame George Sand, the famous writer, whose influence on his life was so great. During this year the first sinister symptoms of ill-health made their appearance. With the idea of benefiting his health, Chopin passed the winter of 1838-39 on the island of Majorca, with Madame Sand and her two children. The climate had a bad effect upon him; he could compose but little, and the condition of his lungs obliged a return to France. He was so ill as to be obliged to spend several months at Marseilles, recuperating. After a summer at Nohant, Mme. Sand's country home, he was again at Paris in the fall of 1839. From 1840 to 1848, he lived in Paris, with occasional visits to Nohant in the summer, teaching as much as his health would allow, passing much time in the most aristocratic society. He seldom played in public, and would only play for pupils, or when persuaded by devoted friends to display his extraordinary gifts as a pianist. During these years, however, his health grew more and more precarious.

=The Last Years of Chopin=.—In 1847, the intimacy of Chopin and Madame Sand came to an end, for various causes, but largely because of a character caricatured from Chopin in one of Madame Sand's novels, and because she was tired of taking care of him. Ill as he was, he went to England, after a farewell concert in Paris, arriving in the spring of 1848. He gave two concerts in London with some success, besides playing at friends' houses. He went to Scotland at the instance of a pupil, Miss Stirling, gave concerts at Edinburgh and Glasgow, besides one in the interval at Manchester. During this entire tour he suffered greatly from ill-health and exhaustion, and after one more appearance in London, he returned to Paris, exceedingly ill, in January, 1849. He was not able to teach and was obliged to depend upon the generosity of friends; among them his pupil, Miss Stirling. After several months of hopeless struggle to regain his health, he died of consumption on October 17, 1849, surrounded by devoted friends.

=Chopin's Personality=.—Chopin was extremely refined and delicate by nature. He was fastidious about the color and fit of his clothes, the furnishing and arrangement of his rooms, and other details of everyday life. He was always extremely fond of society and moved in the highest circles. As a rule, he was averse to seeing much of musicians, in spite of his friendship with Liszt, Hiller, Berlioz and Schumann. As a young man he was fond of dancing, acting and practical jokes; though sensitive, he was well and strong, and able to endure rough stage-journeys. He was a capital mimic all his life, and a witty companion who pleased by his gentle irony or sarcasm. He was extremely reserved in spite of his sociability, his intimate friends (either Polish or favorite pupils) even quarrelled as to which knew him best. He was genuinely confidential only in his music. Chopin was exceedingly patriotic; he was always ready to appear in concert in behalf of Polish refugees, he corresponded untiringly with his Polish friends, and gave many proofs of his devotion to Poland, which he never forgot in spite of years of absence.

=Chopin as Pianist=.—Chopin was a pianist of extraordinary distinction, in spite of the preëminence of Liszt. His technic, founded in the school of Clementi and Cramer, with great attention to Bach, was influenced to some extent by Hummel and Field, but later became highly original, and expressive of great individuality. Although he possessed great brilliancy, the most prominent trait in his playing was its all-pervading and inexhaustible fund of poetry. It had nothing harsh, unmelodious or ungraceful. His sense of rhythm was unusually piquant, and one of its features was the skilful use of _tempo rubato_, a slight variance from strict time without disturbing it fundamentally. In later life, Chopin became disinclined to appear in public, his performances were limited to the drawing-rooms of aristocratic friends, where he would play or improvise for hours. He was never a robust pianist at his strongest, and the transparent delicacy of his playing during his last years was almost incredible.

=Chopin's Compositions=.—Chopin's music constitutes the true revelation of himself. His life, not full of action, was, however, rich in emotion and sentiment of great variety and subtlety. Its mainsprings were his patriotic love of Poland and everything connected with it, and the poetic impressionability of his temperament, which were all transferred to his music. Although Chopin composed a number of works in which he uses the orchestra, some chamber-music, and a set of Polish songs, he was first and last a composer for the piano. In addition to the works referred to, he wrote three sonatas, four ballades, four scherzos, ten polonaises, fourteen waltzes, twenty-eight studies, fifty-five mazurkas, twenty-five preludes, seventeen nocturnes, three impromptus and a fantasie-impromptu, three rondos, besides a superb fantasy, a concert allegro, a barcarolle, a berceuse, a tarantelle, a bolero, a rondo for two pianos, and a few trifles.

Of his two concertos, the second published (although the first composed) is the finer. It is riper and more poetic, the slow movement reaches a high point of lyric style, and the treatment of form throughout the concerto is less awkward. Chopin is not at home in the sonata form, the concertos are interesting in spite of, rather than on account of, their treatment of form. The piano sonatas, Op. 35 and 58, have faults of structure, and occasional incoherence, but they are so full of poetry, romantic melody and dramatic mood that one almost overlooks their technical shortcomings.

=Chopin Most Successful in Free Forms=.—The most representative works of Chopin are those in which he adopts no conventional form, but follows his own instinct entirely. Thus, in his ballades, scherzos, and especially in the fantasy, Op. 49, one finds freedom of invention and variety of treatment combined with logical development and real coherence. The ballads are dramatic poems in which sentiment and virtuosity are happily united. The scherzos are original conceptions quite distinct from the accepted type; they have bold outlines, variety of mood and demand virtuosity in their performance. The fantasy is instructive in its logical structure, there is no sign of the constraint of the sonatas, and its contents are both dramatic on a large scale and lyric by contrast. The impromptus are shorter pieces of a lyric nature, although the element of virtuosity is not lacking. The nocturnes are lyric pieces of simple form but intimate style. Their general plan was at first copied from Field, but the imitator went so far ahead of his model as almost to eclipse it. Some of them portray idyllic moods, others are sentimental or even dramatic in their outlines. The studies, Op. 10 and 25, epitomize in a remarkable way Chopin's technical innovations, and piano style. They are brilliant, poetic and highly dramatic by turns, and in their contents are the most musical studies composed up to their time.

=National Spirit in Chopin's Music=.—Chopin, the patriot, was devoted to the dances and Folk-melodies of his own country. He was thoroughly national as a composer; hence in some respects his mazurkas and polonaises are the most characteristic of his compositions. The mazurkas with their vital rhythms and novel harmonies, contain much poetry of mood and variety of expression within small limits. The polonaise, as treated by Chopin, was less a dance form, and more an independent form with characteristic rhythms. The polonaises, Op. 44 and 53, are virtually patriotic poems. The preludes are sketches of varying size; some are genuine lyrics; some frankly technical in their object; others have a distinct touch of the dramatic. Some of the waltzes suggest the _salon_, but in others Chopin has individualized the type until it has risen above its origin. Among the single pieces, the Concert Allegro is large in dimensions, very interesting technically and musically. The Barcarolle, in nocturne-form on a larger scale, is almost heroic

in its outlines, and a superb example of his mature style. Another piece equally deserving of distinction is the Berceuse, an ingenious series of variations on a persistent bass. The Tarantelle and Bolero are merely fascinating salon pieces.

Of the youthful works with orchestra, the variations on a theme from Mozart's "Don Juan" are more interesting from the novelty of their piano styles than as variations; the Fantasie on Polish themes attracts attention chiefly on account of its Folk-song character, while the "Krakowiak" rondo is remarkable for its spirited national-dance rhythms. The orchestral accompaniments to these pieces are not significant; in fact, Chopin's use of the orchestra was his weakest point. The Polish songs are unequal, and at best add little to his fame. Liszt, however, has transcribed six, of which two are frequently heard in concert, while Sgambati has arranged one.

=Originality and Freshness of Invention=.—The most extraordinary trait of Chopin as a composer is that, in spite of the limitations imposed by repeating the same form over and over again, he is almost inexhaustible in variety of expression. As the poet of lyric mood he accomplished almost as much as Schumann for the development of the short piece, while in his longer pieces of dramatic mood and large contours he has shown that the sonata-form is not the only structure by which to convey heroic sentiment. His was the most subtle originality, the most personal style which stamped itself indelibly on nearly every composition. He immeasurably broadened the technical treatment of the piano, not only as a virtuoso, but in the direction of variety of expression, delicate accentuation and exquisite tone. Among romantic composers he has done more for the advancement of piano style than anyone except Liszt. In spite of the latter's gigantic achievement, the value of Chopin's contribution is still unimpaired. From the point of view of expression, Chopin is more individual even than Schumann, but the honors as the most important composer for the piano during the Romantic period must be divided between them. Chopin's influence has been immense not only on the composers and pianists of France and Germany but also markedly among living composers in Russia. Chopin is the preëminent poet of the piano.

=Representative Compositions=.—The following list for the student contains the works and pieces most thoroughly characteristic of his genius: The sonatas, Op. 35 and 38; the scherzos, Op. 20, 31 and 39; the ballades, Op. 23, 38, 47 and 52; the polonaises, Op. 22, 26, 40, 44 and 53; the waltzes, Op. 18, Op. 34, Nos. 1 and 2; Op. 42, Op. 64, Nos. 1, 2, and Op. 69, No. 1; the studies, Op. 10, Nos. 1, 2, 3, 4, 5, 6, 7, 10 and 12; Op. 25, Nos. 1, 2, 3, 5, 6, 7, 9, 11 and 12; the mazurkas, Op. 6, Nos. 1, 2; Op. 7, Nos. 1, 2, 3; Op. 17, Nos. 2, 3, 4; Op. 24, Nos. 1, 3, 4; Op. 30, Nos. 2, 4; Op. 33, Nos. 1, 3, 4; Op. 41, Nos. 1, 2; Op. 56, No. 2; Op. 59, Nos. 2 and 3; Op. 63, No. 3; Op. 68, No. 2; the nocturnes, Op. 9, Op. 15, Nos, 2, 3; Op. 27, Op. 37, Op. 48, No. 1; Op. 55, Op. 62, No. 1; the preludes, Op. 28, Nos. 1, 3, 4, 6, 7, 8, 9, 11, 15, 16, 17, 18, 20, 21, 23 and 24; the prelude, Op. 45; the impromptus, Op. 29, Op. 35, Op. 51, and the Fantasie-Impromptu, Op. 66; the Fantasy, Op. 49; the Tarantelle, Op. 43; the Berceuse, Op. 57; the Barcarolle, Op. 60, and the Concert Allegro, Op. 46.

QUESTIONS.

Give an account of Chopin's early life.

Name the important events in his manhood and later life.

What were the striking traits of Chopin as a man?

What were Chopin's qualities as a pianist?

In what forms did Chopin compose?

In what form was Chopin most successful?

In which of his compositions is the national spirit strongly evident?

What characteristics do we note in Chopin as a composer?

Name some representative compositions.

What composer influenced Chopin's piano style in his early life?

What celebrated musicians were friends of Chopin?

LESSON XLVI.

FRANZ LISZT.

The piano music of Chopin and Schumann reached the highest level attained during the Romantic period, in subtle originality of style and deep human sentiment, respectively. Notwithstanding their preëminence in these particulars, a master was destined to come who summed up the entire development of piano technic in his achievements, the greatest virtuoso of the century, to whose influence all piano playing since has been obliged to acknowledge its indebtedness. In addition, his services in breaking away from symphonic tradition, in achieving propaganda for various composers of epoch-making works, including Wagner, in giving up himself as teacher without remuneration, are equally significant.

=Liszt's Early Life=.—Franz Liszt was born October 22, 1811, at Raiding, Hungary. His mother was of Austrian birth; his father, a Hungarian, occupying an official position on the estates of Prince Esterhazy, was devoted to music. Liszt was a somewhat delicate child of acute sensibilities, especially in the direction of music. At the age of six he received piano lessons from his father. The intensity of his interest in music and his phenomenal progress soon showed the uncommon extent of his gifts. At the age of nine, he gave his first concert before an audience composed largely of Hungarian nobility. His performance was so extraordinary that some of those present agreed to give Liszt a pension for six years to insure his proper education. Accordingly, father and son went to Vienna, where the boy studied the piano with Carl Czerny and composition with Salieri. Czerny put Liszt through so thorough a course of discipline that at eleven years of age Liszt was known for his playing from scores, and reading the most difficult compositions at sight. In 1823, he gave two successful concerts; Beethoven was present at the second, and publicly kissed the boy in token of his approval. Liszt's father now took him to Paris to study at the Conservatory, but the director, Cherubini, refused to allow him to enter because he was a foreigner. Liszt studied composition, however, with Paer and afterwards with Reicha. In the meantime, letters of introduction from Liszt's Hungarian patrons soon sufficed to make him known throughout the most aristocratic circles, where he created an absolute furore. A public concert produced the same results on a larger scale. Later, Liszt made two visits to England; he was received at the Court of George IV, played in private, and gave concerts. On returning to Paris, he completed an opera, which was performed in Paris. This opera and other compositions of this period have entirely disappeared. Tours through France and a third visit to England followed. In 1827, Liszt's father died, and his mother came to Paris to live; he supported her by giving lessons, and was soon in great demand as a teacher. An unfortunate love-affair caused him to consider entering the church. He lost interest in music, fell ill, and was supposed to be dead. Liszt gradually recovered, however. He now underwent a remarkable series of formative influences; he read widely, formed the acquaintance of many celebrated personages, including Chateaubriand, Lamartine, Victor Hugo and George Sand, became interested in the principles of St. Simonians, a somewhat socialistic sect, dallied with free-thinking and revolutionary tendencies, formed a friendship with the Abbé Lamennais, and became intimate with Berlioz and Chopin.

[Illustration: FRANZ LISZT.]

=Period of Preparation=.—Of far deeper result was the appearance of Paganini in Paris during 1831. Liszt bent all his energies towards devising a transcendent piano technic to reproduce Paganini's caprices on the piano. It was at this time that he laid the foundations of his gigantic achievements in piano technic, not merely in the interest of virtuosity, but for extending the limits of expression. He was also much affected by Chopin's poetic individuality. In 1834, Liszt entered into an intimacy with the Comtesse d'Agoult, which lasted for several years. Three children were born of this union, of whom two survived. One daughter married M. Ollivier, a French statesman, the other became successively Mme. von Bülow and Mme. Wagner. During this period Liszt composed much for piano, made many transcriptions, and began his literary activity on musical subjects. He gave concerts, chiefly for charity. In 1837, he made a trip to Paris to contest the supremacy of the piano with Thalberg. Among his compositions of this period may be mentioned the etudes, the Rossini transcriptions, many arrangements of Schubert's songs, the piano scores of several Beethoven symphonies, besides opera-fantasies, original pieces for piano, etc.

=Professional Activity=.—In 1838, Liszt created an extraordinary sensation by his concerts in Vienna, and from 1839 to 1847 lived the life of a traveling virtuoso, giving an unparalleled series of recitals throughout the length and breadth of Europe, which were a series of triumphs such as no artist had ever before experienced. In 1832, he was made court music-director at Weimar, his duties only requiring his presence for three months in the year. In 1847, Liszt met the Princess von Sayn-Wittgenstein, who exercised a remarkable influence over him. She persuaded him to give up his career as a virtuoso, and turn to composition. From 1848 to 1861 Liszt passed the most significant period of his life at Weimar. From his position as conductor he was of inestimable service to the cause of romantic music through his performance of operas and orchestral works by Wagner, Berlioz, Schumann, Raff, Cornelius and others. He was equally active with his pen in deference to the new artistic principles. To this epoch belong Liszt's most important orchestral works, the concertos and other compositions for piano and orchestra, many transcriptions and editions of the classics.

=Later Life=.—In 1859, opposition to Liszt's progressiveness became so pronounced that he resigned. He did not leave Weimar, however, until 1861. The rest of his life was somewhat irregularly divided between Rome, Weimar and Budapest. During the first few years at Rome he composed chiefly church music and oratorios; in 1865, he took minor orders in the Church of Rome. From 1869 on, persuaded by the Duke and Duchess of Saxe-Weimar, he passed portions of every year at Weimar in a beautiful house especially furnished for him by the Duke. Pupils flocked to him, he held a sort of musical court, and was treated with the respect due to royalty. His later years were full of activity, and generous sympathy to all that was worthy, and he was the constant object of homage and affection. In 1886, Liszt became overtaxed by a series of trips to hear his own works performed, including a reception in his honor at London. He also made exceptional effort to attend a performance of "Tristan and Isolde" at Bayreuth. A cold was speedily followed by pneumonia, from which he died on July 31, 1886.

=Liszt's Personality and Character=.—Liszt's character was remarkable for its conspicuous virtues and almost equally prominent faults. His was a large, noble nature, with deep humanitarian traits. His life was one long service to his art, accompanied in his later years by devotion to the church. Though not highly educated, except in experience of men and the world, he had an extremely keen mind, omnivorous in its tastes, and his interests were wide and penetrating. Perhaps his salient characteristics were generosity and unselfishness. Often during his career as a virtuoso he gave freely of the proceeds of his concerts to charity. After the close of his concert-tours he taught for years without remuneration. His help to younger artists was incalculable in its extent. As conductor at Weimar his motto was to help living composers first, and by his energy he did valiant work in helping Wagner's cause. Largely endowed with wit, a fund of irony and charm of manner, men and women alike almost literally fell at his feet, and it is all the more admirable that in spite of the homage so unsparingly lavished upon him, he did not swerve from his artistic purposes. The strain of mysticism so marked in his youth, became later so pronounced that he felt compelled to give it expression by entering the church.

=Liszt as a Pianist=.—Liszt was the most phenomenal pianist in the history of music. Other pianists have surpassed him in single qualities, but no one has united in so stupendous fashion as much as he. Beginning with a strictly classical education, Liszt evolved a new technic which completely summed up the difficulties of piano playing. In velocity, wide stretches, double-notes, octaves, and a whole system in itself of interlocking passages, he all but attained the impossible. He carried independence of fingers, especially in fugue playing, to a pitch hitherto unequalled. His performance of brilliant music represented the last word in bravura; in the classics his interpretation was, as Wagner says: "not reproduction, but production," so vivid and glowing was it. His so-called "orchestral style" in its bold color and rich pedal effects was as distinct from the piano playing before him as the modern orchestra was from that of Mozart and Haydn. As he assimilated everything in the field of piano playing before him, so has everything since him been forced to take his method into account.

=Liszt's Compositions=.—Among Liszt's chief compositions are the "Faust" and "Dante" symphonies, with choral epilogues; twelve symphonic poems, a form which he invented, and which is epoch-making in the development of music; many shorter orchestral works; two concertos, the Hungarian fantasy, the "Dance of Death" for piano and orchestra, besides several compositions for the same combination on themes of other composers; the oratorios "St. Elizabeth" and "Christus," a Solemn Mass, the Hungarian Coronation Mass, several other masses, twelve sacred hymns for chorus, five psalms, and many other pieces of church music, choruses for men's voices, several compositions for solos, chorus and orchestra for various festival occasions; fifty-five songs for voice with piano accompaniment; three collections containing twenty-five pieces for piano, entitled "Years of Pilgrimage," a collection of the piano pieces named "Poetic and Religious Harmonies," twelve "Etudes of Transcendent Technic," three concert studies, a sonata, two ballades, two "Legends," a concert solo, afterwards arranged as a "Pathetic" concerto, a Valse Impromptu, two polonaises, six Consolations, a Spanish Rhapsody, and nineteen Hungarian Rhapsodies are the best known of the piano

music. There are five ballades for declamation with piano accompaniment. For organ, there is a fantasy and fugue on a choral from Meyerbeer's "Prophet," a fugue on B. A. C. H., and variations on a theme from a Bach cantata.

=Liszt's Arrangements=.—Of almost equal importance with Liszt's original compositions are his matchless transcriptions. Instead of a trivial and literal process of transcribing, he penetrated the intimate spirit of the piece, and translated it into his own piano idiom, often adding considerably but always with supreme artistic effect. What is lost in fidelity of transfer is more than gained in added charm, new harmonic significance and a subtle enhancing of individuality. Liszt started the evolution of his epoch-making technic while experimenting with his arrangement of Paganini's caprices, and of Berlioz' "Fantastic Symphony." He made easy arrangements from operas of Rossini, Mercadante and Donizetti. Then he turned to setting Schubert's matchless songs for the piano, arranging in all fifty-seven; he continued by making piano scores of Beethoven's symphonies, of Rossini's overture to "William Tell," and to Weber's overtures "Jubilee," "Freischütz" and "Oberon." He also made many transcriptions from Wagner's operas, including "The Flying Dutchman," "Tannhäuser," "Lohengrin," "Die Meistersinger," "Tristan and Isolde" and "Parsifal," besides a fantasy on themes from "Rienzi," and an arrangement of the "Walhalla" motive from "The Ring of the Nibelungs." Liszt's arrangements of six preludes and fugues as well as the fantasy and fugue in G minor by Bach are not only remarkable for the extent to which they reproduce organ-effect, but as pioneers in the transfer of organ pieces to the piano, in which Liszt has been followed by Tausig, d'Albert and Busoni. In addition he transcribed fourteen songs by Schumann, thirteen by Franz, eight by Mendelssohn, seven by Beethoven, six by Chopin and two by Weber, besides an arrangement from Mendelssohn's music to "A Midsummer Night's Dream," and "piano scores" of the septets by Beethoven and Hummel. Liszt arranged Weber's "Polacca Brillante," Op. 72, and Schubert's Fantasy, Op. 15, for piano and orchestra. There are also many transcriptions of pieces by Palestrina, Di Lasso, Arcadelt, Mozart, Glinka, Dargomischky, Saint-Saëns, Verdi, Raff, Gounod, Rubinstein, Tchaikovsky, César Cui and others. Liszt scored the accompaniment of several Schubert songs for orchestra, he also orchestrated several of the Schubert four-hand marches. He also arranged many of his own songs, orchestral and choral works for piano and for organ. His transcriptions as a whole are monumental not only on account of their artistic merit, but because they served an educational purpose in spreading the works of little known composers. In this way Liszt cultivated the public taste for Schubert's songs, and brought Wagner within the reach of the average concert-goer.

=Liszt as Writer=.—As a critic, Liszt must stand as a pioneer although in a different direction from Schumann. Liszt's early essay on the position of the artist is extremely significant; his criticisms during the Weimar period, especially his analyses of Wagner's operas were of great value; his "Life of Chopin," while untrustworthy in detail and somewhat overdrawn, is nevertheless graphic; "The Gipsies and Their Music" is picturesque if not entirely accurate. Liszt's letters contain glimpses of his high qualities as well as vital presentations of his musical views. The correspondence between Wagner and Liszt gives conclusive evidence of the latter's unselfishness in Wagner's behalf.

=Liszt's Position and Influence as a Composer=.—Liszt's rank as a composer was undoubtedly overshadowed by his fame as a pianist and teacher, and by his facility as an arranger. For many years neither critics nor public would acknowledge his creative gifts. Whatever our opinion of the symphonies, the symphonic poems and the concertos, there is no doubt that Liszt rendered an inestimable service to the development of music in breaking away from the sonata form, and in demonstrating that form and substance can go hand-in-hand without detriment to organic unity and coherence. His forms are novel, his orchestration highly effective in spite of the achievements of Berlioz and Wagner in this direction. Liszt's church music and his oratorios are worthy efforts towards a reform of ecclesiastic music. His songs are truly spontaneous lyrics, which are not appreciated at their true value. In spite of Liszt's unquestioned attainments as a composer, there is a suggestion of skilful assimilation in his individuality rather than of unique and unquestioned personality. Nevertheless his influence has been vast. In his old age he encouraged Borodin and Glazounoff, he conducted works by Rimsky-Korsakoff, he made his pupils play Balakireff's "Islamey." In turn, the "new-Russian" school owes much to him. Tchaikovsky could hardly have written his symphonic poems without Liszt's pioneer work to show the way. Saint-Saëns admits a similar influence. In fact, the entire development of the symphonic poem is directly due to Liszt; it is so considerable in extent that the details cannot be examined here, but while both Wagner and Berlioz contributed much to the growth of orchestral style and individuality of expression, the originality of the symphonic poem form belongs entirely to Liszt. Thus Liszt's share in the evolution of ultra-modern orchestral music, as well as in the development of piano playing, is very important, and the greatest living composer, Richard Strauss, although also influenced by both Berlioz and Wagner, frankly avows himself to be a disciple of Liszt.

QUESTIONS AND SUGGESTIONS.

What was the nature and extent of Liszt’s early musical education?

What was the effect of his wide travels and meeting with notable persons on his character?

What set him to perfecting his technic?

Name the most important events in his career.

What educational work was the feature of his later years?

Sketch Liszt’s personality and character.

Give an account of Liszt’s contribution to piano technic.

In what styles and forms of composition did Liszt write?

What works did he transcribe for the piano?

What literary work did he do?

What composers did he influence?

What song composer was brought into greater prominence by Liszt?

Whose symphonies did he arrange for the piano?

What opera composer did he assist greatly?

What important form did Liszt originate?

What has been Liszt’s share in the development of the “modern school”?

The student who wishes to examine Liszt’s works for himself, should study the symphonies and symphonic poems in Liszt’s own arrangement for two pianos. They require, however, a technic beyond the average player. The same difficulty applies to his piano music, but the following may serve as guides to Liszt’s style: The “Lake of Wallenstadt,” and “Eclogue,” Nos. 2 and 7, in the Swiss “Years of Pilgrimage”; the “Gondoliera” and “Tarantelle” from “Venice and Naples,” the “Valse Impromptu,” “Ave Maria,” “Waldesrauschen” and “Gnomenreigen,” the pieces for Lebert and Stark’s Piano School, the Concert Studies in F minor and D-flat, the Love Dreams, the Consolations, Nos. 1, 2 and 4; the Legends, the “Benediction of God in the Solitude” and “Love Song” from “Poetic and Religious Harmonies,” and the Fantasie on “Rigoletto.” For the more advanced player may be suggested the Etudes, Nos. 3, 4, 5, 7, 9, 11 and 12; the Mephisto Waltz, the Second Ballad, “Au Bord d’une Source” from the Swiss “Years of Pilgrimage,” the Second Polonaise, the “Funerailles” from “Poetic and Religious Harmonies,” the Sonata, the Hungarian Rhapsodies, Nos. 2, 4, 6, 10, 11, 12, 15, and the Spanish Rhapsody; the two concertos in E-flat and A, the Hungarian Fantasy, and the concert piece “The Dance of Death,” the Fantasy on “Don Juan.” Among the transcriptions, the Schubert songs, “Hark! Hark! the Lark,” “Du bist die Ruh,” “Frühlingsglaube,” “The Wanderer,” “By the Sea,” “Meeresstille,” “Barcarolle,” “Trockne Blumen,” “Wohin,” “Ungeduld,” “Erl-King”; the Mendelssohn song, “On Wings of Song”; the Schumann songs, “Dedication,” “To the Sunshine,” and “Spring Night”; the Weber “Slumber Song” may be suggested. Of the Wagner arrangements, “The Evening Star”, from Tannhäuser, the “Spinning Song,” from “The Flying Dutchman,” and “Isolde’s Love Death,” are the most characteristic. The Paganini Studies, Nos. 2, 3 and 5; the waltz from Gounod’s “Faust,” the Tarantelle after Auber, and the Overture to “Tannhäuser” are among the best. Of the songs, “Mignon’s Lied” and “Ueber allen Gipfeln,” “Comment disaient-ils,” “Angiolin dal biondo crin,” “Es muss ein wunderbares sein,” “Die drei Zigeuner,” and “Der du von dem Himmel bist” and “Die Lorelei” are the best.

LESSON XLVII.

PIANISTS AND TEACHERS SINCE LISZT. I.

=Introduction=.—The achievements of Liszt in developing piano technic, in enlarging the scope of piano playing through his masterly transcriptions, in variety and intensity of interpretation, have brought results that are enormous in extent and far-reaching in their developments to the generations that have succeeded him. When Liszt was in the height of his career as a virtuoso, few could master the difficulties which his epoch-making works presented. Gradually the secrets of his technic were revealed to the ambitious few; now they are almost common property. The great concert pianists of today possess a technic that would have been unique forty years ago. The repertory which all pianists worthy the name play from memory (a practice which Liszt initiated) is exceedingly extensive, while the endurance which they display and the facility with which they reproduce the masterpieces of piano literature is stupendous.

PUPILS OF LISZT.

Liszt was undoubtedly the greatest revealer of the secrets of piano playing in the 19th century, and his pupils and those who have assimilated his teachings occupy a large part of the pianistic activity of today. Among the first of Liszt's pupils to become famous were Tausig and von Bülow. =Carl Tausig=, born in 1841, died in 1871, was trained by his father, and later studied with Liszt, under whose guidance he achieved a phenomenal accuracy of technic, and a commanding power of interpretation. His short life was spent mainly in concert tours. He established a school of music in Berlin for advanced piano playing. His untimely death cut short a brilliant career. His edition of Clementi's _Gradus_ and a collection of finger exercises are invaluable to teachers and to students. =Hans von Bülow=, born in 1830, died 1894, was intended for the law, although he studied the piano as a boy under Friedrich Wieck. In 1850, he became so absorbed in Wagner's music that he abandoned all idea of the law. He studied the piano with Liszt at Weimar, and soon acquired a remarkable technic. He was never a pianist of the virtuoso type; his strength lay in striving to reproduce the intention of the composer as faithfully as possible. His interpretations of Beethoven were especially famous, although he was progressive in his tastes. In 1876, he made a tour in the United States, where he did much to advance the cause of new music. As early as 1865 he conducted performances of Wagner's operas, and later his association with orchestras at Meiningen and of the Berlin Philharmonic Society placed his reputation as a conductor in the front rank. He was extremely energetic in Wagner's behalf and did much to bring his works to a public hearing. His editions of Cramer's studies and Beethoven's sonatas are of great value.

Among Liszt's later pupils, one of the foremost is =Eugen D'Albert=, born in 1864. He received his early training in England, but in 1881, as a prize scholar, he studied with Liszt at Weimar. After brilliant concert tours through Europe, he came to America, in 1889, with Sarasate, where his ability was at once recognized. He has since largely renounced the career of virtuoso for that of composer, although he made a visit to the United States in 1905, giving a number of recitals.

=Moritz Rosenthal=, possibly the most fully equipped virtuoso technically now before the public, was born in 1862. At first a pupil of Mikuli, a disciple of Chopin, and later of Joseffy, he came ultimately to Liszt, with whom he studied for ten years. After numerous European tours he came to the United States in 1888, where he dazzled his audiences by his unusual command of technic. He reappeared in America in 1896-97, and has since made triumphal progress through Europe. As an interpreter he is less successful than as a virtuoso. He is court pianist of Roumania. He has published a collection of technical exercises with Ludwig Schytté.

=Bernhard Stavenhagen=, born in 1862, is another noted Liszt pupil. He acted as Liszt's secretary during his later years, and at the same time received lessons. In 1890, he became court pianist at Weimar. In 1894-95, he visited America. Since then he has acted as conductor at Dresden and Munich.

=Emil Sauer=, another phenomenal pupil of Liszt, was born in 1862. At first a pupil of Nicholas Rubinstein, he studied with Liszt from 1884 until the latter's death. He possesses an extraordinary technic, and is almost unrivalled for the extreme brilliancy of his effects. He has received many decorations from various courts of Europe. In 1897-98, he visited the United States, where he made a sensation. Since 1901, he has been at the head of the piano department in the Vienna Conservatory, giving his attention to pupils in the artist department.

Among other talented pupils of Liszt may be mentioned Alfred Reisenauer, Arthur Friedheim and Richard Burmeister, all of whom have been heard in this country. The foregoing account does not begin to enumerate all, merely the celebrated pupils of Liszt. Others will be referred to in the course of this and the next lesson.

=Belgian Pianists=.—In piano playing, the Brussels Conservatory is far below the level of the Paris Conservatory, although the director =Gevaërt= has a world-wide reputation for his text-book on orchestration, and the symphony concerts at the conservatory, led by him, have a high place in orchestral standards. Nevertheless, in the piano department two names deserve mention: Brassin and Dupont. =Louis Brassin= (1840-1884) studied at the Leipzig Conservatory under Moscheles, where he remained five years, winning numerous prizes. In 1866, he became first piano teacher at the Stern Conservatory in Berlin. Later he joined the Brussels Conservatory, as professor of piano playing, where he taught from 1869-1878. In 1879, he accepted a position at the St. Petersburg Conservatory, where he remained until his death, in 1884. Brassin was not only known as a fine pianist and teacher, but also by his transcriptions from “The Ring of the Nibelung.” He also composed piano pieces and even two operettas. =Auguste Dupont= (1828-1890) studied at the Liége Conservatory. After several years of wandering life, he became professor of piano at the Brussels Conservatory, a position which he held until his death, in 1890. He is known also as a composer of graceful piano pieces, a concerto and a concert-piece, in all of which the influence of Schumann is seen.

=Johannes Brahms= (1833-1897), famed both as composer and pianist, was the son of an orchestral musician in Hamburg, whose circumstances were of the humblest. As a child he developed remarkable ability as a pianist, but his first lessons in composition awakened an enthusiasm that absorbed his entire being. He was comparatively unknown when at the age of twenty Schumann brought him into public notice by hailing him as the successor of Beethoven.

Unlike most composers, Brahms was mature from the very beginning. His early works bear no trace of the uncertainty and imitation generally associated with youth, and it was this remarkable maturity that interested Schumann and gave point to his predictions for the future of the young musician. Unaffected by the pomp and glow of the ultra-romantic tendency initiated by Berlioz and culminating at present in the works of Richard Strauss, he remained true to the great classical school which rests on Bach and Palestrina. Unlike the modern impressionistic school, his art is based on essentially musical ideas and their contrapuntal treatment; it is architectural rather than pictorial. In such a scheme, color is subordinate to thematic interest, hence his instrumentation often appears heavy and austere to those who look for the brilliancy and tone painting of Liszt or Wagner. His music in general is founded on Bach and Beethoven.

[Illustration: JOHANNES BRAHMS.]

His works for the piano are large and orchestral in style, and demand a technic of their own, which was at first considered unsuited to the nature of the instrument. Von Bülow remarks that while in Bach we hear the organ, in Beethoven the orchestra, in Brahms we hear both organ and orchestra. Notwithstanding their dignity and nobility of conception, they won their way but slowly to favor. Their newness of style and difficulty of execution estranged both public and musicians. Though Brahms’ four symphonies have become reasonably familiar, his piano works have not even yet achieved widespread popularity. They comprise two concertos, three sonatas, many variations, and a host of smaller pieces—ballades, scherzos, intermezzos, capriccios, etc. Brahms never wrote for the stage but was active in all other departments of music. His greatest choral work is the “German Requiem,” composed in memory of his mother, to texts selected by himself from the Scriptures and sung in German, instead of in Latin, hence its name. He drew no little inspiration from the Folk-song, which he uses not only in the form of harmonies and rhythms distinctly based on Folk melodies, but in literal quotations serving as themes in several of his instrumental compositions. This contact with the people through their songs gives particular freshness and vigor to much of Brahms’ music, as well as a sturdy Teutonic character that stamps it as distinctively national in spirit.

It is perhaps too soon to deliver an authoritative judgment as to the ultimate rank that Brahms will take among the great composers of the past. There is no doubt, however, that he is one of the commanding figures of the last century and that he has enriched the world with a mass of noble music, all of which deserves to be known for its elevation and consummate mastery of detail.

RUSSIAN PIANISTS.

Of a somewhat independent development from Liszt, although much influenced by his personality and his method, was =Anton Rubinstein=, born in 1829, died in 1894. He studied the piano at Moscow with Villoing, who gave him so thorough a training that he had no other teacher. From 1840, after concerts in Paris, he had universal recognition as a pianist. Further European tours increased his fame. He lived successively in Berlin and Vienna, and later returned to St. Petersburg. In 1872-73, he made a remarkable tour through America, arousing an enthusiasm only equalled in later years by Paderewski. Although he passed most of his life in constant activity as a composer, he directed the Russian Symphony Concerts in St. Petersburg. As early as 1862 he founded the St. Petersburg Conservatory, which has had a prominent place in Russian music. He was a complete master of the

piano, his technic was gigantic, although his vitality of interpretation was so intense that details paled before it. His historical recitals covering the entire literature of the piano were his most conspicuous achievements as a pianist. He may be regarded as second only to Liszt, and in some respects he even surpassed him. He was disappointed at not being accorded high rank as a composer, as well as a pianist.

His brother, =Nicholas Rubinstein=, born in 1835, died in 1881, although not so distinguished a pianist, and a composer of slight account, exerted almost as strong an influence on Russian music. A pupil of Kullak, he founded the Russian Musical Society at Moscow, in 1859, and in 1864 the Moscow Conservatory, which has been exceedingly active in Russian musical affairs. He directed the Moscow Conservatory until his death; he was an intimate adviser of Tchaikovsky, while his worth as a teacher may be guessed from the prominence of his pupils, Karl Klindworth, Emil Sauer and Alexander Siloti, possibly the foremost Russian pianist today.

=Mili Balakireff=, born in 1836, has been a considerable force in Russian music, besides being a capable pianist. After studying physics and mathematics at the University of Kazan, he turned to music. In 1862, he founded a Free School of Music in St. Petersburg. Among his associates were César Cui, Nicholas Rimsky-Korsakoff, Alexander Borodine and others. He has done much to aid the Neo-Russian school of composition. His piano music is effective and highly colored, especially his fantasy on Georgian themes, “Islamey.”

=Alexander Siloti=, undoubtedly the most widely-known of Russian pianists, born at Charcow, 1863, was a pupil in piano playing of Nicholas Rubinstein, at the Moscow Conservatory. From 1883-1886, he studied with Liszt. His technic is enormous; while not intensely magnetic, his intellectual grasp of music is remarkable. He made an American tour in 1898, when he introduced much Russian piano music that was new. Although Siloti has taught at the Moscow Conservatory, he has lived of late years at Leipzig and Paris.

Among other Russian pianists are =Vassili Sapellnikoff=, born 1868, a pupil of Kessler, Louis Brassin, Sophie Menter; =Vassili Safonoff=, a pupil of Leschetizky and Zaremba in St. Petersburg, since 1887 director of the Moscow Conservatory, and more lately a conductor; =Sergei Rachmaninoff=, born 1873, a pupil of Siloti, not only a brilliant pianist but also a composer of originality; =Alexander Scriabine=, born 1872, a pupil of Safonoff, who has made successful European tours, and like Rachmaninoff, has composed much for his instrument.

Two German pianists, Henselt and Klindworth, were so associated with Russian music as to warrant their mention here. =Adolph Henselt=, born 1814, died 1889, at one time a pupil of Hummel, was for the most part self-taught. He passed most of his life in St. Petersburg, giving lessons and playing frequently in public. He also had an official position as music inspector. As a pianist, Henselt was exceedingly eminent, and may be ranked next to Rubinstein and von Bülow, although in later years nervousness prevented his playing in public. His etudes are distinct additions to the technical resources of the piano, his arrangements of Cramer etudes with second piano accompaniment are praiseworthy.

=Karl Klindworth=, born 1830, was a pupil of Nicholas Rubinstein and later, of Liszt. After living in London, he became professor of piano playing at the Moscow Conservatory, from 1868-1884. Later he settled in Berlin, became conductor of the Philharmonic Society, and opened a conservatory with von Bülow, which was merged with that of Scharwenka in 1893. Klindworth’s edition of Chopin is in some respects the best. He has also edited Beethoven’s sonatas, and he prepared the piano score of the entire “Ring of the Nibelung.”

FRENCH PIANISTS.

In presenting the famous French pianists, =Charles Henri Valentine Alkan=, born 1813, died 1888, must not be forgotten. A brilliant pianist, he claims our attention chiefly on account of his etudes, introducing novel and extremely difficult problems of technic. Musically his studies cannot be compared with those of Chopin or Liszt, but they merit attention, particularly in the modern editions.

Although =Camille Saint-Saëns= is known chiefly as a composer, he was, during his early years, a remarkable pianist. His contributions to piano literature, five concertos, etudes and smaller pieces, are all valuable.

A group of Paris Conservatory professors constitute the most distinguishing teaching talent in France today. Further than that, Paris is one of the great centres of piano playing in Europe. Its teachers follow their own traditions, yet have assimilated from Liszt.

The oldest of these is =Georges Mathias= (b. 1826), pupil of Chopin, Kalkbrenner and the Paris Conservatory, who has been professor of piano playing since 1862. =E. Delaborde=, a pupil of Alkan, Moscheles and Liszt, has taught at the Paris Conservatory since 1873. One of the most successful teachers now living is =Louis Dièmer=, born 1843, a pupil of Marmontel. Winning the first piano prize at the age of thirteen, he succeeded his former teacher in 1888. Dièmer has turned out many first prizes; he has an impeccable technic; he has done much to foster interest in the harpsichord, the oboe d'amore and other obsolete instruments. He has published valuable collections of old French harpsichord music, besides original works. A Conservatory teacher well-known in America is =Raoul Pugno=, born 1852. A pupil of the Paris Conservatory, he obtained first prizes in piano playing, organ and harmony. He came to America in 1897-98 with Ysaye and others, and again in 1902. He has taught at the Paris Conservatory since 1897. He has a superb technic, and is versatile as an interpreter. He has also composed much. A teacher of unusual insight into technic is =Isidor Philipp=, born 1863, a pupil of Mathias, Saint-Saëns and others. He possesses a flawlessly accurate technic, and has appeared frequently in public, although he devotes the greater part of his energy to teaching. He has published many valuable sets of exercises, collections of difficult passages, some transcriptions and original pieces. He has been professor at the Conservatory since 1904.

=Louis Breitner=, a pupil of the Milan Conservatory, Anton Rubinstein and Liszt, has lived for many years at Paris as pianist and teacher. He also has visited America. Among the younger French pianists are =Leon Delafosse=, =Edouard Risler=, an eclectic pianist, a pupil of Dièmer, D'Albert and Stavenhagen.

QUESTIONS.

Who were the earliest of Liszt's pupils?

Name some later pupils of Liszt.

Who are the leading exponents of the Belgian school?

Whose principles did Brahms follow?

What are the characteristics of his works?

What was Anton Rubinstein's chief characteristic as a pianist?

Whom did Nicholas Rubinstein assist greatly?

By what piano piece is Balakireff best known?

What Russian pianist has visited America?

Name two young Russian composer pianists.

Give some account of Henselt.

Who made the piano score of Wagner's "Ring of the Nibelung"?

Name some successful teachers of the piano at the Paris Conservatory. Which one has twice visited America? Which has published many valuable sets of exercises?

LESSON XLVIII.

PIANISTS AND TEACHERS SINCE LISZT. II.

One of the greatest living teachers in authority and breadth of influence is =Theodor Leschetizky=, born in 1831. A pupil of Czerny, he began to teach at the age of fifteen, having played in public since 1842. He became a teacher in the St. Petersburg Conservatory, where he taught for many years. Soon after 1880 he settled in Vienna, where he has lived ever since. Since the success of his pupil Paderewski, Leschetizky has been the most sought-after teacher in the world. He has been obliged to have assistants to prepare pupils for him. Students have come to Vienna from all parts of the world. A brilliant pianist, he has written piano music and even an opera, but his merit as a teacher is due to the foundation given him by Czerny, who acquired his traditions from Beethoven, to the keenness of his ability to prescribe for the individual needs of the pupil and the simplicity and directness of his "method." His pupils have met with great success, although he has not yet produced a second Paderewski.

=Ignaz Paderewski=, probably the greatest pianist since Liszt, although like him excelled in some respects by others, was born in 1859. A pupil of the Warsaw Conservatory, he also studied at Berlin. He taught piano at the Warsaw Conservatory from 1878-83, and also at Strassburg. Later he went to Leschetizky for a thorough course of study. After his début at Vienna, in 1887, he conquered by degrees Paris and London. His first visit to America was in 1891, when he carried all before him. Since then he has visited the United States three times, he has traveled over all Europe, and has visited Australia with overwhelming success, financial and artistic. His most noticeable qualities are a magnetic personality, a virtuoso technic, the color and piquant rhythm of his playing, and the poetry and deep human intensity of his interpretations. He has written several sets of pieces for the piano, a concerto, and a fantasy with orchestra, and an opera. His generous gift of the endowment of triennial prizes to American composers is an admirable instance of his warm-heartedness.

=Josef Slavinski=, born 1865, who studied with Stroeble, Anton Rubinstein and finally Leschetizky, is a pianist of great ability who came to the United States in 1873, and again in 1901. Other Leschetizky pupils are =Ossip Gabrilowitsch=, born 1878, also a pupil of Anton Rubinstein and the St. Petersburg Conservatory, who came to America in 1900 and 1902; =Mark Hambourg=, born in 1879, who first studied with his father, and after a tour of the United States in 1900, has had brilliant successes in Europe and England; =Martinus Sieveking=, born 1867, a pupil of Röntgen at Leipzig, who visited America in 1895 and again in 1896-97 and afterwards went to Vienna. There are many other brilliant pupils of Leschetizky, but the foregoing are some of the best known.

Paderewski has not taught, as a rule, since his great triumphs as a virtuoso, but he has made exceptions. =Sigismond Stojowski=, born 1870, was a pupil of the Paris Conservatory, where he won first prizes in piano playing and composition. Later he studied with Paderewski, and lived as pianist, teacher and composer in Paris. In 1905, he accepted the position of head of the piano department at the Institute of Musical Art, New York City. =Antoinette Szumowska-Adamowska= was born in 1868. She studied at Warsaw, and later, for several years, with Paderewski. She has made successful appearances in Europe and America. Later she accepted a position at the New England Conservatory, in Boston, U. S. A.

Another pianist of great ability who has profited by Paderewski's suggestions is =Harold Bauer=, born in 1873. A student of the violin, as well as of the piano, he did not consider making a career as a piano virtuoso until encouraged by Paderewski. In 1892, he studied with Paderewski, although he is largely self-taught, for his individuality and musical style show slight effects of Paderewski's influence. Bauer's technic is superb, although he is not a virtuoso pure and simple. His interpretations are healthy and vigorous, and especially faithful to the composers' intentions. His repertory is enormous. He has made several extremely successful tours to the United States. He has traveled also widely in Europe as well as to South America. Bauer is one of the most eminent of living artists.

Among Norwegians, =Edvard Grieg=, born 1843, is a remarkable interpreter of his own individual works. =Christian Sinding= and =Wilhelm Stenhammar= also deserve mention.

The Italians have not produced many remarkable pianists, nevertheless, several are well known. Chief among them is =Giovanni Sgambati=, born 1843, a pupil of Liszt. Sgambati has composed charming music for the piano, as well as chamber-music, a concerto and symphony. He is director of the Academy of St. Cecilia, at Rome. =Giuseppe Buonamici=, born 1846, a pupil of the Munich Conservatory and of von Bülow, has done much to promote music in Florence. He has been connected with several

musical societies in that city, and has been active as a teacher. His editions of Beethoven's sonatas, of Bertini's etudes, and a treatise on scale playing are of great value to the student. The most prominent Italian pianist, who has lived a cosmopolitan life, is =Feruccio Busoni=, born in 1866. Early in life he became a member, as a pianist, of the Bologna Philharmonic Academy, after a severe test. In 1888, he accepted a position at the Helsingfors Conservatory. In 1890, he won the Rubinstein prize as composer and pianist. Subsequently he taught the piano in the Moscow Conservatory, and later he was connected with the New England Conservatory at Boston. Since then he has lived in Europe as a pianist and conductor of ultra-modern music. Busoni has one of the most formidable technics of any pianist living. He has edited Bach's "Well-Tempered Clavichord," with many helpful technical suggestions, also the smaller preludes and inventions; he has made masterly transcriptions of Bach's organ works for the piano, of a fantasy for organ by Liszt, the same composer's "Mephisto Waltz," etc. He re-visited America in 1904.

=Stephen Heller=, born 1814, died 1888, was much influenced by Chopin. He was a talented pianist, who will be remembered chiefly by his studies, and a few other pieces, which have decided educational value.

Among other living pianists who escape classification for one reason or another are =Moritz Moszkowski=, born 1854, a pupil of the Dresden, Kullak and Stern Conservatories; while a successful pianist and teacher, he is known chiefly for his fluent and graceful piano music, although he has composed works in larger forms. =Franz Rummel=, born 1853, died 1901, a pupil of Brassin and the Brussels Conservatory, toured Europe and visited America several times; he taught at the Stern Conservatory in Berlin; =Rafael Joseffy=, born 1853, went to the Leipzig Conservatory, he then studied with Carl Tausig and later with Liszt; of late years he has taught at the National Conservatory at New York. His concert appearances have invariably been successful, although he has devoted himself largely to teaching. A pianist of especial distinction is =Vladimir de Pachmann=, born in 1848, a pupil of the Vienna Conservatory; in spite of a brilliant début he retired for many years' study; on reappearing he gave concerts over all Europe, and has made several visits to America; his chief triumphs have been as the inimitable interpreter of Chopin; =Leopold Godowsky=, born 1870, appeared as a prodigy at the age of nine; he studied at the _Hochschule_ in Berlin, made European tours, and studied with Saint-Saëns from 1887 to 1890; he taught at conservatories in Philadelphia and Chicago; in 1902, he returned to Europe, where he has given concerts constantly with phenomenal success. A composer of piano pieces, he has devised many extraordinary versions of Chopin's studies.

Among English pianists, =Frederic Lamond=, a pupil of the Raff Conservatory, of von Bülow and Liszt, and =Leonard Borwick=, a pupil of Mme. Schumann, are the best known, although there are many pianists of rising reputation.

Two young pianists deserving of especial recognition are Ernst von Dohnanyi and Josef Hofmann. =Dohnanyi=, born 1877, is a pupil of Kessler and D'Albert. In 1898, he won a double success as pianist and composer with a piano concerto. In 1900, he made a brilliant tour in America. Since then he has devoted himself largely to composition. =Josef Hofmann= was a pupil of his father, and later, of Anton Rubinstein. He played the piano when six years old; in public at the age of nine. In the following year he gave fifty-two concerts in the United States. After retiring for study under Rubinstein, he reappeared a mature artist. He has since visited America several times. Hofmann has an unusual technic; his individuality is not striking, but he is an artist of conspicuous merit.

AMERICAN PIANISTS.

The rapid progress of music in America renders it impossible to do justice to piano playing in this country. However, the pioneer work of =William Mason=, a pupil of Moscheles, Dreyschock and Liszt, active as pianist and teacher, the author of "Touch and Technic" and other technical treatises; of B. J. Lang, a pupil of his father, F. C. Hill, Salter and Alfred Jaell, an active pianist, teacher, and conductor, of W. S. B. Mathews, Otto Dresel, Ernst Perabo, and others, was of great importance. Later =Carl Baermann=, a Liszt pupil, Carl Faelten, =William Sherwood=, also a Liszt pupil, Carl Stasny, Arthur Whiting, Edward MacDowell and many others have continued the work so ably begun. =Edward MacDowell= is easily the most noted American composer-pianist. His technical equipment, personality, and interpretative gifts justly entitle him to this distinction. A pupil of Mme. Carreño, Marmontel and Carl Heymann, he has had thorough training. His pianistic career has been limited by his efforts as a composer, and by his work as Professor of Music at Columbia, which position he resigned in 1904, as well as his activity as a teacher. His studies, concertos and smaller pieces show great individuality of technical style, besides being among the most valuable contributions to piano literature since Liszt. MacDowell has appeared with leading orchestras in this country; he has given many recitals, including a tour of the United States in 1904.

WOMEN PIANISTS.

Of the many distinguished women pianists since Liszt, the most eminent was =Mme. Clara Schumann=, a pupil of her father, Friedrich Wieck. She played in public from the age of thirteen, winning instant recognition. Her marriage to Schumann diminished her public activity, but after his death in 1856, she resumed her career. She taught at the Hoch Conservatory at Frankfort, besides playing in public in Europe and England. Among other famous women pianists were Madame Clauss-Szavardy, =Mme. Arabella Goddard Davidson=, and Mme. Sophie Menter. =Mme. Teresa Carreño=, a pupil of L. M. Gottschalk and G. Mathias, has had a remarkable career as concert-pianist. =Mme. Essipoff=, a pupil of Wielhorski and Leschetizky, taught for many years at the St. Petersburg Conservatory, after brilliant concert tours. Miss Fanny Davies, a pupil of Reinecke and Mme. Schumann, Mme. Roger-Miclos and Mlle. Clotilde Kleeberg, pupils of the Paris Conservatory, are all pianists of distinction. In this country Miss Adele aus der Ohe, a pupil of Kullak and Liszt, =Mme. Bloomfield-Zeisler=, a pupil of von Wolfssohn and Leschetizky, and =Mme. Helen Hopekirk=, a pupil of the Leipzig Conservatory and of Leschetizky, now a teacher at the New England Conservatory, and =Mme. Szumowska-Adamowska=, before mentioned as a pupil of Paderewski, are all pianists of great ability.

In conclusion, it may be stated that while Liszt's pupils have done much to carry on the traditions which he originated, much has also been accomplished for the advancement of pianistic art by Leschetizky and his pupils, a remarkable group of teachers at the Paris Conservatory, and by such independent pianists as de Pachmann, Busoni, Siloti, Godowsky, Bauer and Hofmann, while many able conservatories and private teachers in America are enabling the American pianist to compete favorably with Europe.

QUESTIONS.

Who is the best-known piano teacher of today?

Name some of his famous pupils. Which one instituted prizes for American composers?

Name some pianists who have profited by Paderewski's advice. Which one has made successful tours of America?

Name the most famous Italian pianists. Which one has made masterly transcriptions of Bach and Liszt?

What pianist has made a specialty of Chopin?

What young pianist has made an especially brilliant impression in America?

Name the pioneer pianists of America.

Who is the most famous of American composer pianists?

Name some talented women pianists.

SUGGESTIONS FOR A REVIEW OF LESSONS XLI TO XLVIII.

This period is of great interest to the student, as the greater part of the piano literature in use today is the work of composers belonging to the Romantic and Post-Classical schools. It must not be forgotten that in studying the history of music the object is to learn to know the music of the best composers, not merely certain facts and dates in the lives of these composers. The works cited in the lessons give a wide latitude in the matter of choice and a clear idea of the contribution of the different composers.

LESSON XLI.—1. Take a composition by each of the composers mentioned and show its distinctive qualities. 2. Show the deeper, fuller, more poetic character of the compositions of Field as compared with Clementi.

LESSON XLII.—1. Give a sketch of Schubert the man. 2. Name the special qualities of Schubert's music. Why does he belong to the Romantic school?

LESSON XLIII.—1. What is the nature of Weber's contribution to music? 2. What are the special qualities of Mendelssohn's works?

LESSON XLIV.—1. Compare Schumann's work in the short pieces and in the large forms. In which was he the more successful? 2. Give an analysis of some of his short pieces.

LESSON XLV.—1. In what forms did Chopin do his best work? Mention some pieces as illustrations. 2. In what ways did he show national spirit? Mention pieces.

LESSON XLVI.—1. Give a sketch of the important factors in the making of Liszt the pianist. 2. What influence did he exert on music?

LESSON XLVII.—1. Compare Rubinstein and Liszt. 2. What influence did Brahms exert on music?

LESSON XLVIII.—1. Make a list of the various pianists and classify them as to nationality and school.

LESSON XLIX.

THE ART-SONG. ORATORIO AFTER MENDELSSOHN.

=Development of the Art-Song Idea=.—A most significant phase of musical activity is that centred around the art-song for solo voice. In the period before the opera, choral singing was the principal medium for vocal music. With the Opera came a style of composition from which was developed the principle of the Aria, the latter dominating both Opera and Oratorio for many years, as the form for an art-song for a solo voice. In this form, as we have seen, the production of vocal effects, the making of attractive melody, and the opportunity for virtuosic display were sought first of all. It was not until the beginning of the 19th century, when Schubert's peculiar genius asserted itself, that we meet what can be truly called the art-song, a form of composition without the artificiality of the operatic aria and with higher musicianly and artistic qualities than those that mark the people's song. Several tendencies contributed to bring this about. Gluck's theories and practice led both composers and people to pay closer attention to the text and to its delivery. The development of instrumental music, particularly the principles of thematic treatment, led composers to the inventing of new melodic and rhythmic figures that should serve as the basis of accompaniments of higher artistic quality than those founded on some variation of the Alberti bass figure. Piano technic had greatly improved, and so had the instrument. And it may also be said that the verse of this period was better suited for a dramatic musical setting than the formal, often stilted and artificial lyrics of earlier days, with their shepherds and shepherdesses and constant reference to pastoral and classical life.

=Italian, French and English Forms=.—A study of musical conditions in Italy, France, Germany and England shows a different style of the solo song in each country, each having some distinctive feature that maintains today, and one that may be said to characterize the song-idea of that people. The Italians were so taken with the opera and in the course of its development it so fully embodied the national love for sweet, graceful melody that a species of art-song apart from the opera had little or no chance to shape itself. The French _Chanson_ has never yielded place to the methods which distinguish the modern art-song. The French language has certain qualities which seem to call for a treatment that centres the attention in the voice part rather than on the song as a whole, according to the German idea. Yet French composers have produced and still make most beautiful and charming songs which unmistakably embody the national characteristics, clearness, polish and an effective singing melody. The old English Ballads are pieces of narrative verse; but the term has been used so freely and for almost every kind of verse that it is not possible to give it a precise definition. Thomas Morley, in a work on music, which he published in 1597, mentions "songs which, being sung to a dittie may likewise be danced"; in 1636, in a book called "The Principles of Musicke," the author, Butler, refers to "the infinite multitude of Ballads set to sundry pleasant and delightful tunes by cunning and witty composers, with country dances fitted to them." The principles of musical construction and the character of the text are such that we do not find in the English ballad the true germ of the art-song.

=The German "Lied"=, a poem intended for singing, as it came from the hands of the great poets, such as Goethe and Heine, seems to have afforded to composers the inspiration to the making of a style of song that should have the value of a musical setting in full consonance with the character of the text. As instrumental music developed, the _Volkslied_, the people's song, the natural medium for expression, gradually disappeared. Yet composers made use of it as a medium, such masters as Haydn, Mozart, Beethoven and Weber giving attention to it, although the demand for a simple, clear melody, due to the dominance of the Italian opera, and for an accompaniment that was always much subordinated, prevented the art-song (_Kunstlied_) from taking a high place. Since then the accompaniment has been given more and more prominence, less attention being paid to pure melody and more to the value of harmony and rhythm as the means for characteristic color and expression. Melody, which is made up of a succession of phrases, cannot furnish a sequence of sharp effects so readily as can well contrasted chords; hence the old idea of tune changed as harmony became better understood. The methods of song composers vary, and a classification is made by German writers: A song that has simple form and tune akin to that of the Folk-song is called "_Volksthümlich_"; one that has the same tune to the different stanzas is called strophic; one that is carefully worked out, the music illustrating every shade of meaning and emotion is called "_Durchcomponirt_"; a narrative song is called a "Ballad" or "Ballade." The great masters in song composition are Schubert, Schumann, Franz and Brahms.

=Schubert as a Song Writer=.—A consideration of Schubert's education and his general make-up shows clearly why he should seek outlet for self-expression in song rather than in the large instrumental forms. We find that he was not systematically educated

in musical science, like Mozart, Beethoven or Weber, and that he was by nature very spontaneous and amenable to external influences. Such a composer is particularly open to the effect of a poem and will turn to the small song form rather than to the elaborate instrumental forms. Many of Schubert's songs were written on the spur of the moment in response to an impulse from reading a chance bit of verse. The first reading of the poem usually gave the complete idea, both tune and accompaniment; whether it should have the simple folk-song character, a more declamatory style, strophic or the more elaborate form, depended upon the character of the text. It is fortunate for music that he was brought into contact with some of the finest lyrics in the field of poetry, such as called forth his highest powers in melody, harmony, rhythm, modulation, declamation and recitative, for he aimed to the very fullest extent possible to heighten the thought of the text by the emotional power of music. It is a phase of Schubert's genius that some of his finest songs were written before he had reached his majority.

=Schumann and His Songs=.—Schumann brought to song writing a different type of mind from that of Schubert, more poetic, more gloomy, more emotional, a fine literary training, a faculty for expression in word as well as in tone, a fund of new forms of expression in instrumental music, particularly the piano, so that we find in his songs certain elements that indicate development toward a more highly organized structure. Schumann was highly intellectual, hence we find in his songs a close union of voice and instrumental parts in working out the fundamental conception of the poet's meaning; and so deeply does he carry out this plan that the accompanist must enter most thoroughly into the singer's part, and _vice versa_, that the full effect be brought out; as compared with the songs of Schubert and Mendelssohn we can say that the latter are the "verses set to tunes, while Schumann's songs are poems in music." The piano part of a Schumann song contains the atmosphere of the poem, is an attempt to heighten the meaning by suggesting thoughts and feelings which the words, spoken or sung, cannot express; sometimes it is an entirely independent composition, and carries out to a final close the thought left unfinished by the voice, thus avoiding the conventional ending, by the singer, on the tonic chord. Schumann's effort was to express his own reading of the poet's lines by the musical means that seemed to him best suited to the purpose. To this end he refused to allow himself to be bound by conventional treatment, either of voice or instrument.

=Robert Franz= (1815-1892) combined in his songs the romanticism and general methods of Schumann, with a polyphonic treatment inspired by his deep study of Bach. He wrote to various styles of verse, hymns, love-songs, lyrics of the field, the forest, the hunter, the soldier, and though his songs lack the tender, passionate, melodious quality of Schubert's and the deep poetic feeling of Schumann's, they are nevertheless models of perfect, even elaborate workmanship in which the composer follows with great faithfulness the mood of the poet; Schumann, on the contrary, seems to project his own interpretation of the poem into his music, while Schubert seems to grasp the emotion at its highest moment and the song pours out as the spontaneous expression of the singer.

=Three Modern Writers=.—Of modern writers, those who contributed most to the development of the art-song are Wagner, Brahms and Richard Strauss, the first-named by his style and treatment of the voice and the instrumental part rather than by his songs, which are few in number. =Brahms= wrote nearly two hundred songs, varying in character and quality, and using a highly-developed accompaniment, often intricate in its construction, complicated in rhythm and restless in harmonic support, employing all the resources which his mastery of chromatic harmony placed at his disposal. He frequently wrote in the style of the Folk-song, making use of its simple melodic quality, enriching it, however, by his great skill in elaboration in the accompaniment. Brahms' songs are great favorites on concert programs. =Richard Strauss= (b. 1864) is the leading composer of today, and has used in his songs the principles that distinguish his large works. These songs are very difficult, both for voice and accompaniment, and are full of tonal coloring, for Strauss has adapted to the miniature form of the song the means of harmonic and rhythmic effects which he uses so powerfully in his orchestral scores. When well sung and well played, the hearer cannot but be absorbed by the wealth of musical effects of the highest emotional and picturesque quality displayed in Richard Strauss' songs. In a full study of songs and song writers, many more names would be mentioned; those selected for consideration in this lesson represent those who have contributed most significantly to the development of the modern art-song.

=Oratorio Composers after Mendelssohn=.—The later history of the Oratorio requires some consideration at this point. After Mendelssohn, many of the leading composers of Europe turned their attention to this form of composition, influenced, in many instances, by the splendid opportunities for production offered by the strong choral organizations and festival associations of Germany and England, as well as by the great advances made in orchestral playing, which gave to composers resources far beyond those at the hand of Mendelssohn and his predecessors. We may mention, among the Germans, =Schumann=, whose "Paradise and the Peri" was produced in 1843; =Liszt=, who was much attracted to sacred subjects, wrote two oratorios, "The Legend of St. Elizabeth" and "Christus"; =Rubinstein=, who used his great skill in tone painting with orchestral masses in "Paradise

Lost" and in his sacred opera "The Tower of Babel"; =Brahms=, whose "German Requiem" is a standard work to be done well only by thoroughly disciplined vocal and instrumental forces; and =Dvo■ák=, who has shown great power in his "Stabat Mater." Among the French writers most prominent in this form of composition are =Berlioz=, whose "Requiem" is a colossal work in which he drew upon all the resources of the orchestra to heighten the powerful, dramatic character of the text; =Gounod=, who wrote his remarkable works, "The Redemption" and "Mors et Vita" for English production; =Saint-Saëns=, whose "Noël," a Christmas work, is oratorio in style and construction, although small in dimensions; and =César Franck=, the most modern of all, whose "Beatitudes" has been made the subject of much discussion. English composers, following the lead of Handel and Mendelssohn, have given great attention to this form. =Bennett=, the friend of Mendelssohn, produced a beautiful work, "The Woman of Samaria"; =Costa=, an Italian by birth, spent a great part of his professional life in England; hence his oratorio, "Eli," may be classed with English works; =Sullivan= wrote two oratorios, "The Prodigal Son" and "The Light of the World"; =Macfarren's= "St. John the Baptist" and =Mackenzie's= "Rose of Sharon" can be classed among oratorios. The most eminent in this form at the present day is =Elgar=, "The Dream of Gerontius" and "The Apostles." Young Italy has lately shown interest in this form, the most noteworthy being the =Abbé Perosi=, who is under the patronage of the Pope. In the United States the leading representatives are =J. K. Paine=, of Harvard University, with the oratorio "St. Peter," =Dudley Buck=, "Golden Legend," and =H. W. Parker=, "Hora Novissima."

=The Cantata=.—More popular even than the Oratorio with choral societies is the Cantata, both sacred and secular, and the great increase in strong choral organizations, particularly in England, Germany, France and the United States, has resulted in the production of a number of splendid works which show dramatic power and the highest skill in handling voices and instruments. These works contain opportunities for the use of the finest quality of melody, variety of rhythm, solid harmonic or the more fluent polyphonic style, richness of harmonic coloring and every accessory in the way of tone painting by the orchestra, which such masters as Berlioz and Wagner pointed out. The important works are too many to be mentioned here; only the composers' names can be given. In Germany, Brahms, Bruch, Dvo■ák, Gade, Goetz, Hiller, Hofmann, Rheinberger; in France, Berlioz and Massenet; in England, Bennett, Corder, Cowen, Macfarren, Mackenzie, Smart, Sullivan, Coleridge-Taylor among the younger men; in the United States, Buck, Foote, Chadwick, Gilchrist, Paine, H. W. Parker, and Carl Busch.

QUESTIONS.

Compare the Aria and the Song.

Mention the characteristics of the Italian, French and English people's songs.

What are the characteristics of the German _Lied_?

Give a sketch of Schubert as a song writer.

Give a sketch of Schumann as a song writer.

Compare the two.

Give a sketch of Franz as a song writer.

Compare him with Schubert and Schumann.

Who are eminent among modern song writers?

Mention the special characteristics of each.

Name the leading composers of Oratorio after Mendelssohn, and their works.

What is the difference between an oratorio and a cantata?

What composers have done successful work in this line?

Songs of the leading composers, classic and modern, should be studied. The lessons on Schubert, Schumann, Liszt, etc., mention notable songs. Analyze an oratorio by one of the composers mentioned in this lesson, also one or more cantatas.

RICHARD STRAUSS. SIEGMUND HAUSEGGER.]

LESSON L.

THE SYMPHONIC POEM IN GERMANY.

=Wagner's Influence=.—The genius of Wagner produced and applied to Opera a far richer and more complicated orchestration than had existed before his day. Since then, in many periods and in many countries, composers have tried to adopt his style, and apply it to the symphonic as well as to the operatic stage. In the field of purely orchestral music, Liszt and Berlioz had already formulated a free style, and their symphonic poems, departing from the set form of the symphony, have also served as models for later composers. Almost the only recent exponent of the strict form was Johannes Brahms, for Anton Bruckner, working on similar lines, did not achieve great success with the public.

=Richard Strauss=.—For many years it was thought that Wagner's orchestration would remain unrivalled in the field of music. But Richard Strauss (born at Munich, Germany, 1864) has made a further advance in this respect, and handles the full modern orchestra with the utmost skill. Son of a court horn-player, his musical genius showed itself in his earliest years, and his studies with the court capellmeister, F. W. Meyer, resulted in the publication of several works. At first he followed Brahms and the stricter school, and his F-minor symphony is a worthy production in that form. A meeting with von Bülow led to his appointment as assistant-conductor at Meiningen. To show his ability, Strauss had to conduct, without rehearsal, his Serenade, Op. 7, for thirteen wind instruments; and the excellence of this work brought him the desired position. It was at this time that he met Alexander Ritter, a man of broad intellect and radical ideas. Under the new influence, Strauss renounced his classical style, and began to compose the tone-pictures and symphonic poems that have made his name so important. As he is the chief modern representative of the new school, his works merit detailed examination.

=His Early Symphonic Poems=.—After an Italian trip in 1886, Strauss gave his impressions of that country in the form of the symphonic fantasie "Aus Italien," his first work in the free style of subjective emotion-painting. It is in four movements, each a complete tone-picture. The first, "On the Campagna," gives a vivid impression of spacious solitude, with a hint of the pageants and battles once witnessed by this great Roman field. The second movement, "Amid Rome's Ruins," aims also to give "fantastic pictures of vanished splendor, feelings of sadness in the midst of the sunlit present." The third movement, "On the Shores of Sorrento," resembles the symphonic scherzo, while the finale gives an animated picture of "Neapolitan Folk-Life," introducing the air of "Funiculi" and other popular Italian tunes.

After four years of conducting at the Munich court theatre, Strauss settled in Weimar, where he produced three more important works. The first of these, "Macbeth," showed that he had abandoned the old form in favor of the symphonic poem, in which the different movements are fused into one large whole, free in form. The picture of Macbeth, ambitious and cruel in spite of his timidity, is ably developed, but the portrayal of Lady Macbeth brings a still stronger climax of magnificent orchestral power.

"Don Juan," the second of the three, is founded on Lenau's poem. The hero is not a ruffian adventurer, as in Da Ponte's libretto, but is depicted as an arch pessimist, hunting through the world for perfection in pleasure, but never finding it. There are restless and uncertain melodies at the opening, to illustrate the hero's unsatisfied longing. A knightly theme follows, typical of Don Juan himself. Then come various episodes, full of attractive enthusiasm, but always ending with the same vague unrest. A wild carnival, followed by sudden silence and the cutting theme of a trumpet, announce the hero's end.

"Tod und Verklärung" (Death and Transfiguration) is a work of great power and beauty. It depicts an exhausted sufferer, asleep in the quiet sick-room, dreaming of the beauty of his lost youth. Then follows a more discordant episode, which may well picture a fierce contest with the powers of disease, ending in defeated exhaustion. A third portion brings renewed memories of the morning of life; passages of joyous enthusiasm and noble aspiration suggest the high hope of youth and the glorious achievement of manhood; but again comes the struggle with the powers of Fate, ending in despair and death. The fourth part is an apotheosis,

representing the triumph of man's upward striving over death. This section contains some of the most impressive orchestral beauties in the range of Strauss' works.

=Program Music=.—In the older symphonic form, it was not necessary for the composer to suggest a title for his work. Many have done so—Beethoven in his "Pastoral Symphony," Mendelssohn in the "Scotch," for example; but the exquisite beauty of Schubert, or the romantic charm of Schumann will impress the hearer without the use of extraneous suggestions. In the modern school of program music, founded by Liszt, the composer gives the audience a more or less detailed account of the subject that inspired him, and tries to paint in tones the events or moods suggested by the title. Much, therefore, depends on the choice of the subject. If it is well-known, and gives definite suggestions of certain moods which can find expression in the orchestra, then it may receive legitimate treatment by being set to music. But if the subject is not one that lends itself to broad emotional treatment, or if the composer aims to picture definite events or objects, he is departing from the true function of his art. Music deals with expression of emotion, and should not attempt something that belongs rather to other arts, such as Literature or Painting. Many persons think that Strauss has gone too far in this direction, especially in his later works.

=His Later Symphonic Poems=.—In "Till Eulenspiegel," the hero is a mediæval rogue, whose adventures are found in an old German tale. He is a wandering mechanic, who does anything but tend to business. He is always indulging in madcap pranks, in which he manages to escape from his well-merited punishment. In the composition, Strauss has given free rein to his fancy, and portrayed, with rare orchestral skill, the fantastic jokes, the sly humor, and the rollicking disposition of the graceless rogue. The work is in rondo form, with definite themes to typify the hero. These themes form the basis of the music, and are varied and developed with infinite skill and remarkable orchestral irony.

"Also Sprach Zarathustra" (Thus Spake Zarathustra) is based on Nietzsche's mystic philosophy. Zarathustra, or Zoroaster, alms to teach the doctrine of the "Over-Man," by which man is to become a sort of demigod who rises above good and evil into realms of joy. A picture of the "Hinterweltlern," or dwellers in the Rear-World of common humanity, portrays their yearnings, their joys, and passions, while their sorrows find voice in a tender "Grave-Song." Science and its futility are represented by a fugue replete with chromatics. A passage entitled, "The Convalescent," shows the defeat of the spirit of sorrow and evil, and the triumph of joy. Then follows the wild, chaotic, but strangely-effective "Dance-Song," the exultation of the "Over-Man." Yet his triumph is not lasting, for at the close, after a sudden stroke of the bell, comes the weird "Song of the Night-Wanderer," and the piece ends mystically in two different keys, as if representing eternal doubt. Strange as this work may seem, its effect is one of vast sublimity, and Nietzsche's wild philosophy is translated into orchestral effects of remarkable grandeur.

With "Don Quixote" Strauss enters the more definite field of program music, and aims to picture events. It is cast in the variation form, but is much more free in style than that title would imply. There is a theme for the Don, clear at first, but becoming obscure and illogical, to show that he loses his sanity. He is represented by a solo 'cello, while his faithful squire Sancho, strange to say, appears mostly in viola passages. Each variation treats of one adventure. The windmills are attacked, with disastrous results. The flock of sheep are heard, bleating in full chorus until put to flight. The bands of pilgrims are dispersed as robbers. The blindfold ride through the air on the wooden horse is made realistic by the use of the theatrical wind-machine. Other adventures follow, and at the end the knightly theme recurs in a clarified form, to show Don Quixote's return to reason and death. It will readily be seen that this work is more experimental than the earlier ones.

"Ein Heldenleben" represents the fight of Strauss with his adverse critics. There are six well-marked sections. First comes the hero himself, portrayed by definite themes that are woven into a strong climax. Then his enemies are depicted, with remarkable irony, by a medley of crackling, snarling figures for woodwind. The hero's helpmate is represented by a solo violin, and in this section an instrumental love-duet is introduced. Then follows a picture of the hero's battlefield, ending in a song of victory. The hero's works of peace are then described, and the meaning of the composition is made clear by the introduction of themes from the earlier works of Strauss. The final section shows the hero's departure from an ungrateful world. This piece is grandly planned, but like other orchestral works of Strauss, its themes are not melodic and lack musical charm.

The "Sinfonia Domestica" pictures a day in the composer's family life. Here, again, the subject is one that the hearer cannot understand without an arbitrary explanation. Strauss has given no complete analysis, but has deigned to explain that the three themes in the early part represent father, mother and child, that the picture begins in the afternoon and lasts until the next morning, and that the final fugue represents the education of the child. The unmelodic style of Strauss is little suited to such a subject, and the effect is such as to make the work seem puzzling, at first, if not actually ridiculous.

=His Other Works=.—Of the two early operas by Strauss, “Guntram” and “Feuersnoth,” neither has had real success; nor does his third production, “Salome,” seem important. Guntram is a fighter for love, a member of a mystic fraternity. He rescues Freihild from the tyranny of Duke Robert, who loves her, and in the struggle he kills Robert. Freihild falls in love with him, but he must renounce her, as he knows that he killed Robert out of rivalry in love, an unworthy motive. “Feuersnoth,” lighter in style, is based on the old legend of a scornful maiden, whose pride meets punishment. All fire in the town goes out, and no light can be rekindled, save by a touch of her body; so that she finds herself exposed to the multitude. In this work, as in “Heldenleben,” Strauss has introduced veiled attacks on his critics. The music to both operas shows the usual richness of coloring and orchestral intricacy, but their themes lack the direct power of the guiding motives in Wagner’s works.

=The Songs of Strauss= are many in number, and include some with orchestral accompaniment. They show a modulatory style, combined with a rare melodic beauty that seems strange in a composer who indulges in so much orchestral ugliness. Some of these songs, such as “Traum durch die Dämmerung” or “Allerseelen,” are gems of purest water. The songs are often involved in style, but always possess unity and directness of effect. Their beauty shows that the discords in the composer’s orchestral works are intentional, and not due to lack of melodic invention. Yet it would seem as if his great mastery of instrumental coloring could have been employed as effectively in scoring beautiful themes, instead of the commonplace passages so often found in his larger works.

=Hausegger=.—Siegmund von Hausegger (Graz, Austria, 1872) is another master of the modern orchestra. His father was a musician of broad experience and sound learning, so that it is not strange that his son’s gifts developed quickly. After his regular studies at the gymnasium and the university, Siegmund took up music in earnest, under his father and Degener. His youthful works were now augmented by a piano quartet, a fantasia, the orchestral ballad “Odinsmeeresritt,” the one-act drama “Helfried,” and the opera “Zinnober,” based on a tale of Hofmann. These were followed by a number of songs and choruses, but Hausegger’s real greatness was first revealed by the “Dyonisiac Fantasie,” a symphonic poem for full orchestra. This was followed by a still greater work, “Barbarossa,” while in 1904, at the Frankfort festival, came “Wieland der Schmied.” “Barbarossa” is in three movements. The first shows the happiness of the people gradually fading into sorrow and pain, until the Barbarossa theme at last is heard; for tradition says that the great emperor is not dead, but sleeps in the mountain Kyffhäuser, waiting to arise when the need of his people is too great to be borne. The second movement is a weird, ghostly picture of the enchanted mountain and the sleeping emperor; while the last depicts his awakening, his coming forth at the head of his knights, their victory, and the rejoicing of the people. Wieland is the wonderful smith whose swords cut off a head so cleanly that it remains in place. The first movement shows his vision of the beautiful maid Schwanhilde, appearing from celestial regions; but when he would claim her, she retreats, terrified. A second part shows his sorrow and despair. In the third movement hope again triumphs, and he forges for himself a pair of wings. In the last movement the united lovers leave the dull world behind, and take their flight to regions of eternal sunlight.

=Other Orchestral Composers=.—=Gustav Mahler= (Kalisht, Bohemia, 1860) gained his musical experience as a director in some of the lesser theatres, and is largely self-taught. Besides two operas and a number of beautiful songs, he has composed five symphonies. He has tried to enlarge the symphonic form without departing from it. His symphonies all aim to express some definite thought, such as pessimism finding its cure in simple faith, love of nature leading to a high idea of Pantheism, or doubt clearing in the joys of immortality. The movements are arranged in contrasting groups, and voices are introduced, at first solo, and then often in a final chorus of triumph. Mahler’s works are planned on a grand scale, but his music is often unclear and restless in effect. =Paul Felix Weingartner= (Zara, Dalmatia, 1863) is another musician who served his apprenticeship in the smaller theatres, and became one of the world’s great conductors. He is known by his two symphonic poems, “King Lear” and “The Elysian Fields,” as well as by two symphonies in strict form, and by several chamber works. His opera “Genesius” and his classical trilogy “Orestes” are other successful works. =Jean Louis Nicodé= (Jerczik, Posen, 1853) is somewhat older than the modern tone-poets, and if less important is still noteworthy as an exponent of the program tendency. His two greatest works are the “Symphonic Variations,” Op. 27, and “Das Meer,” for male chorus, soloists, orchestra, and organ. The latter is not a cantata, but rather a great suite, in which vocal movements are balanced against orchestral numbers. Among younger men, =Hugo Kaun= is familiar to Americans because of his long sojourn in Milwaukee. His symphonic poems based on Longfellow’s “Hiawatha” show much fluency and taste. Switzerland now has its set of young composers, with =Hans Huber= as their leader in the orchestral field.

=The Present Situation=.—The rich harmonies and free modulations of Wagner, combined with the setting aside of symphonic form by Liszt, have caused the more recent composers of Germany to give up almost wholly the writing of symphonies. The free style of tone-picturing has been widely adopted, in consequence of the example of Strauss. He has gone so far that some of his works seem merely colossal experiments in this direction, and it is not improbable that a revulsion from such extreme musical

impressionism will take place some time in the future.

CECILIA OF THE PINK ROSES

CHAPTER I

WHERE IS GAWD?

The Madden flat was hot and the smell of frying potatoes filled it. Two or three flies buzzed tirelessly here and there, now and again landing with sticky clingingness on a small boy of four who screamed with their advent. When this happened a girl of seven stepped from the stove and shooed them away, saying: "Aw now, Johnny!" and Johnny would quiet.

The perspiration stood out on her upper lip and there were shadows, deeper than even Irish ones should be, beneath her eyes. The sun beat in cruelly at one window which was minus a shade. At another the shade was torn and run up crookedly.

In the hall there was the sound of a scuffle, then a smart slap, and a child's whimpering wail.

"What's--that?" came in a feeble voice from the bedroom off the kitchen.

"It's the new gent in the flat across whackin' his kid," answered the small girl.

"Oh," was the weak answer, and again there was quiet, broken by the sizzle of hot fat, the tireless buzz of the flies, and now and then the little boy's cry.

"Here, Johnny," commanded the small maiden, "come have your face washed off." Johnny objected. She picked him up with decision, and set him on the table with resounding emphasis, where he screamed loudly during the rite.

The door opened. A man in overalls came in. "Hello, Paw," said Cecilia Evangeline Agnes Madden. He answered her with a grunt and kicked off his heavy shoes.

"Gawd, it's hot!" he said with his first contribution to the conversation. "Two Dagos got sunstruck. One of 'em he just went like a goldfish outa water, keeled over, then flop,--flop. The Boss he up an'--"

"Supper, Paw," said Cecilia. She pushed a chair up to the oil-clothed table, and the man settled, beginning to eat loudly. He stopped and pointed with his knife to the bedroom door. "How's she?" he asked in a grating whisper.

"She ain't so good," answered the small girl. Her eyes filled with tears and she turned away her face.

"Maw--Maw--Maw!" cried Johnny.

"Aw now!" said his sister while she picked up his hot little person to comfort him.

"Maw--Maw!" he echoed.

Cecilia looked up. Her eyes were like those of a small dog that has been whipped. "I ain't the same," she said across his brick-dust curls. "He wants _her_, I ain't the same. I do my best, but I ain't her."

The man laid aside his knife. He set his teeth on his lower lip, and then he asked a question as if afraid to.

"Has the doctor been here?"

"Yes," answered Cecilia.

"Whatud he say?"

"He sez she wasn't so good. He sez she wouldn't be no better 'til the weather was cooler an'--"

"Celie!" came in the voice from the bedroom. Cecilia put down Johnny.

"Yes, Maw," she answered gently.

"Celie!" came again in almost a scream. Celie vanished. She reappeared in a few moments. She was whiter than before.

"She throwed up fierce," she said to her father; "something fierce, an' all black. Don't you want no coffee?" The man shook his head. He reached for his shoes.

"Where yuh goin'?" asked Cecilia.

"Doctor's," she was answered. He went into the bedroom. "Well, old woman," he said loudly, "how yuh feelin', better?" The thin creature on the bed nodded, and tried to smile. The smile was rather dreadful, for it pulled long lines instead of bringing dimples. Her blue lips stretched and the lower cracked. A drop of blood stood out on it.

"Gawd, it was hot to-day," said the man. He settled by her bed in a broken-backed chair. She stretched out a thin hand toward him.

"Mary--!" he said, then choked.

"Aw, Jerry!" said the woman. In her voice was little Cecilia's tone of patience, with the lilt removed by a too hard life.

"Do yuh feel _some_ better?" he entreated.

"Sure--I do. Gimme that glass of water--" She drank a mouthful and again vomited rackingly.

"Oh, Gawd!" said Jeremiah Madden. He laid a rough hand on her forehead and she pulled it down against her cheek.

"Jerry," she said between long gasps, "I been happy. I want you should always remember that I been happy. Awful happy, Jerry."

"Oh, Gawd, Mary!" said the man. "If I'd a knew how hard you'd a had to work, I wouldn't have brung yuh!"

"Don't!" she begged. "Don't say that!" She looked at him, time faded, and with it a hot and smelling flat. She stood on a wind-swept moor. Jerry, only eighteen, stood by her. His arm was around her with that reverent touch that comes in Irish love. "I'll send fer yuh," he'd said, "after I make me fortune in America."

She had cried and clung to him. With her touch, reason and a rolling moor had faded for him. "I can't leave you," he had said, "I can't! Mary, you come with me." And Mary had come. Those days had been beautiful.... But fortunes in America did not come as advertised. Sometimes Mary thought of green turf, and the gentle drip-drip of fog, like rain. That rain that came so often.... Now she thought of it more than ever. She hoped that the Virgin would allow her a little corner of Heaven that would look like an Irish moor.... The gold the priest talked of was "grand," but heresy or not, she wanted a bit of green, with the gentle drip of rain on it.

Jeremiah bent and kissed her. Then he rubbed the spot of blood of her lip from his. "It wasn't no mistake," he said. Her eyes grew moist.

"Jerry," she said, "Celie is a good kid. She kin do fer yuh. Ain't she, right along? She won't give yuh no trouble neither. But the kid--he ain't so easy. It's the kids growin' up in America better'n their folks, that go to the devil. Watch him, Jerry, watch him good. Won't yuh now?" The man nodded; she closed her eyes. After a few moments that throbbed with the heat of the flat, she spoke again.

"Jerry," she said.

"Darlin'?"

"It's this way, Jerry. I always wanted to be a lady--"

"Yuh are!" he interrupted hotly.

[Illustration: "NOW LAUGH! PAW'S COMING HOME AND HE NEEDS ALL OUR LAUGHS"]

"No," she stated quietly, "I ain't, an' I always thought I could be. The Irish learns fast. It's this way, Jerry; if ever the time comes when you get money, you send Celie to one of them schools that learns 'em French and drawin' and such, Jerry, will yuh?"

"Before Gawd, I will, Mary. If I ever kin."

She closed her eyes and slept quietly, clinging to his hand.

The next day was Sunday so Jeremiah went to Mass and heard it with especial intention. If his thoughts were more on the gentle Saint slowly dying in a hot flat than on the Gentle Mother, who can blame him.

Jeremiah went from the baroqued church vastly comforted, and painfully aware of his Sunday collar, which had rough edges. Cecilia had rubbed soap on it, but it still scratched. Outside Jeremiah went, not in the direction of his home, but in the other. He passed a beggar's entreating wail, and then retraced his steps to bestow a penny,--and even pennies were not easily spared. Jerry was still a little child at heart. He was courting divine favour. He needed God and all the Saints on his side.

After a brisk walk of many blocks he turned into a house with a doctor's sign on it. The office was crowded; he sat, outwardly submissive, to wait his turn. "Blessed Mother," he prayed, "make him mak'er well. Mother of the Saviour--" his thoughts were a chaos. "A gold heart!" he promised rashly, even while he remembered the unpaid grocer's bill. A woman with a pallid skin and hacking cough crept from the office. Across from him a boy exhibited a burn to an interested neighbour. "Blessed Mother,--" entreated Jeremiah, even while his eyes saw the burn and he wondered how it had happened.

A crisp young person in white, who gave an impression of great coolness, said, "Your turn next." Jerry jumped and got up. Two little girls, at the Sheraton period in legs, giggled loudly at his jump, but Jerry didn't notice. He stopped on the threshold of the inner office. He twirled his hat in his hands. "Mister," he said, "it's my wife I come about." The doctor had been up all night. Added to his fact was the fact that he was fitted, emotionally, to run a morgue.

"Name?" growled the doctor. Jeremiah Madden sank to a chair and told his name, of his wife, and how sick she was. He also interspersed a few facts about Irish moors, love and business in America. And he ended with: "An my doc he sez' no one can save her but Doctor Van Dorn. He's the cancer man of New York. The only one who can possibly save her! He sez that," repeated Jeremiah. "Oh fer Gawd's sake, Doc! I can't pay yuh now but--"

The doctor swung about in his swivel chair. "My time is entirely mortgaged," he stated curtly. "I can't keep up to my work. Your wife will probably die anyway; accept the inevitable. You couldn't pay me, and I haven't the time. All New York bothers me. Good morning."

He turned back to his desk. Jeremiah went toward the door. His step was a blind shuffle. Hand on the knob, he paused. "Doc," he said, "I love her so, an' the little kids, they need her. I feel like she'd live if you'd help her. I promise I'd pay. All my life I'd pay an' thank Gawd I could--" he stopped. The doctor moved his shoulders impatiently.

"The Virgin will reward yuh--" said Jeremiah. "Oh, Doc! Fer Gawd's sake!"

"Good morning," answered the doctor with another impatient move of his shoulders. Jeremiah left. A young person in crisp white said, "Your turn next, Madam." Madam went in. "Oh, Doctor, my heart--" she began. The doctor got up to move her chair so that the light would not trouble her.

Jeremiah spent the morning in going from office to office. First he told the unfavourable report of his doctor. He met sympathy in some quarters, curt refusals in others, and worst of all he sometimes met: "Cancer of the stomach? Not much chance--"

At half after one, sick from the sunlight of the cruelly hot streets, he turned into an office for his last try. He felt numb.... His tongue was thick. He looked with resentment on a well-dressed woman who waited opposite him. "Flowers on her bunnit," he thought, "while my Mary--" He thought of his hard labour and, with bitterness, of the "Boss." He had never felt this way before. If he'd had money, he reflected, how quickly that first doctor would have helped him.... The other refusals had come from truer reasons. His own doctor's report, although Jeremiah didn't realise this, had stopped all efforts. If the doctor had said no one but Van Dorn could help her, Lord, what chance had they? This was their line of reason.

Jeremiah sat in the outer waiting room. At last his turn came. The doctor looked tired; he was gruff in his questions. "I'll come with you and look at her," he said at last. Jeremiah felt a sob rise in his throat. The doctor rang a bell.

"Tell Miss Evelyn," he said to the maid who answered him, "that we'll have to give up our drive this afternoon. She's my little girl," he explained to Jeremiah. "Her mother's dead,--I don't see as much of her as I should. A doctor has no business with a family. I'm ready. Come on."

They went out by a back door, leaving an office full of patients. The sun was hot. Jeremiah prayed fervently even while he answered the doctor's questions and responded to his pleasantries. At last they came to the building which held Jeremiah's home. They mounted the long stairs. Two or three children, playing on them, stopped their squabbling and looked after the doctor with awe.

"He's got a baby in that case," said one, a fat little girl with aggressive pig-tails.

"There is too many now," said a boy. "They don't all get fed, and they're all beat up fierce. Our teacher in that there corner mission sez as how Gawd is love. Why don't he come down here an' love?"

There was an awed silence after this. Outright heresy as it was, the immediate descent of a thunderbolt was expected.

Upstairs Jeremiah opened the door of the flat. The kitchen was full of women. Several of them sobbed loudly.... Johnny Madden sat on the table, eating a piece of bread thickly spread with molasses. On seeing Jeremiah the women were suddenly silent. Jeremiah swayed and leaned against the door.

The small Cecilia heard him and came from the bedroom.

"Paw," she said, "I'll do all I kin fer yuh. I always will.... She was happy. She sez as how she seen green fields an' rain." Jeremiah took her in his arms. He hid his face against her thin little shoulder. His shook. Cecilia was very quiet. She had not cried. She looked over her father's head at the roomful of gaping women. Something flashed across her face. Her teeth set.

"She always wanted a bunnit with pink roses on it," said Cecilia. "I don't see why Gawd didn't give her jest _one_."

The man sobbed convulsively and Cecilia remembered him. "She was happy," Cecilia said in a less assured tone. "She sez as how she seen green fields with rain on 'em like Ireland."

CHAPTER II

THE VISION OF A PROMISED LAND

As Mrs. Madden had said, "The kids that grow up better than their folks go to the devil." Cecilia felt this at eleven, for she was all of Johnny's mother, and the role was a difficult one. She had learned to spat him and kiss him judiciously, and at the proper times. She had learned to understand his marble games and to coax him into attendance at Catechism.

Cecilia had begun to understand a great many things at eleven that some of us never understand. One thing made learning easy for her,--she loved so greatly that she was often submerged into the loved, and so saw their viewpoint.

"Paw," said Cecilia. She had turned about on the piano stool, and Jeremiah looked up from his paper. "Well?" he questioned.

"I been thinking," she said, "that it would be genteel to ask the priest to supper. It ain't as though we hadn't a hired girl to do fer us, an' it would be polite."

"That's so, that's so," said Jeremiah. He laid aside his paper. "You're like your maw," he added. Cecilia knew he was pleased. She smiled happily.

"An' have ice-cream?" suggested the interested Jeremiah.

"Yes," said Cecilia, "an' chicken, an' fried potatoes, an' waffles, an' of course pie, an' biscuits, an' suchlike. I'd like to entertain Father McGowan, he's been good to us."

"Yes," answered Jeremiah. They were both silent. The vision of an overcrowded and smelling flat had come to sober them. Also the memory that always went with it.... "Play me 'The Shepherd Boy,'" said Jeremiah. He closed his eyes while Cecilia banged it out in very uneven tempo, owing to difficulties in the bass.

Johnny came in. He sat down on a lounge covered with a green and red striped cloth. He looked at Jeremiah with a supercilious expression.

"The other fellahs' fathers wears their shoes in the house," he stated coldly. "The Shepherd Boy" stopped suddenly. Cecilia went toward the "parlor." "Johnny!" she called on reaching it. Johnny followed meekly. The parlor was the torture chamber. When he went in Cecilia put her hands on his shoulders.

"Johnny," she said in her gentle little way. "Um?" he answered, wriggling beneath her hands.

"Johnny," she repeated, "it ain't polite to call down your paw."

"But Celie," objected John, "he ain't like the other fellahs' fathers. They wears collars an' shoes, _all_ the time."

"I know, dear," said Cecilia. "I know, but it ain't polite to call down your paw, an' nothing can make it so."

"Aw right," answered John sullenly. Cecilia leaned over and kissed him. John didn't mind, "none of the fellahs being around." He went back to the living room. Jeremiah had put on his shoes. He looked at Johnny, awaiting his approval.

"An' Norah," said Cecilia, excited to the point of hysteria, "you see that I get the plate with the crack in it, an' the glass with the piece outa it."

"Sure, I will," answered Norah. "Now go 'long."

Cecilia went to the dining room. They were going to eat there, because they were going to have company. Norah was not going to sit down with them either. It was to be most formal and "elegant."

And now for the decorations. Cecilia put on two candlesticks, each at a corner of the table. They did not match, but why be particular? Then she took a bunch of peonies, and, removing all foliage, jammed them tightly in a vase that had the shape of a petrified fibroid growth, and had accumulated gilt, and a seascape for decoration.

"It looks bare," said Cecilia. She went to her room and brought out a new hair-ribbon, worn only twice. She unearthed this from below a hat trimmed with pink roses. The hat was gorgeous and beautiful, but she could not wear it.... Looking on "bunnits with pink roses on 'em" always made her a little sick. The hair-ribbon was tied around the vase in a huge bow. Cecilia stood off to admire.

"Norah!" she called.

Norah appeared. "Ain't that grand?" she commented. "Now ain't it?"

"Well," answered Cecilia, "I don't care if I do say it, I think it's pretty swell! Norah, you use the blue glass butter dish, won't you?"

"Sure," answered Norah, and then with mutters of waffle batter, she disappeared. Cecilia stood a moment longer looking at the table in all its beauty. The plates were upside down. Napkins (that all matched) stood upright in tumblers. The knives and forks were crossed in what was to Cecilia the most artistic angle.

"It's grand!" she said with a little catch in her breath. "Just _swell_!" Then with a backward glance, she vanished. "I hope paw'll like it," she muttered as she went upstairs.

Father McGowan was a charming guest. He looked at the decorations and then on the small Cecilia with softened eyes: "Now I'll bet you fixed this beautiful table!" he said. Cecilia nodded, speechless. She drew a long, shaky breath. Life was so beautiful.... Father McGowan put his hand on her curls. (She sat next to him at the table.) His touch was very gentle.

"Good little woman?" inquired the priest of Jeremiah.

"She's maw and all to all of us," answered Jeremiah. There was a silence while they ate.

"This chicken," said Father McGowan, "is fine!"

"It's too brown, I'm afraid," answered Cecilia with the deprecatory attitude proper while speaking of one's own food. Her father looked at her with pride. The priest's eyes twinkled.

"Paw," said Cecilia, leaning across the table and putting her hand on her father's, "tell Father McGowan how yuh hit the boss on the ear with the brick." Jeremiah sat back in his chair, first laying his knife and fork with the eating ends on the plate and the others on the cloth. He drew a long breath and told a long tale, at which the priest laughed heartily. He ended it thus: "An' I sez, 'I ain't _dee_pendent on no man. Yuh can do yer own brick layin' an' here's one to start with!'" With that Jerry had hit him on the ear. It was a dramatic tale, and one which made Cecilia swell with pride over a wonderful paw!

The priest leaned across the table. "Have you a patent protection on those bricks?" he asked.

"Why, no," answered Jeremiah. The priest talked long and fast. Cecilia could not understand all of what he said, but he mentioned unusual qualities of Jeremiah's product. His own knowledge of such things came through a brother in the same business. The necessity of a little risk and a big push. He talked loudly, and excitedly. He mentioned Cecilia and John as the incentive to gain.... He spoke of what he knew to be true of Jeremiah's product. Jeremiah sat very silent. If what the priest said were true! They went to the living room, where, over a pitcher of beer, there was more talk, incomprehensible to Cecilia.

Then the priest smiled, and said: "All right, Jerry. In five years you'll be a millionaire. Now, Cecilia, I want to hear a piece." Cecilia sat down to play "The Shepherd Boy." Her fingers trembled so that it wasn't as good as usual, but the priest was pleased. Then she left, and wiped the rest of the dishes for Norah. Norah said that the priest was a "swell talker" and that she hadn't minded the extra work.

Cecilia went up to bed very happy. She slipped out of her pink silk dress and hung it in the closet. As she reached up, a hat, all over bobbing roses, slid from the closet shelf to the floor. Cecilia's smile faded. She put it back, and shut the door.

CHAPTER III

THE FIRST STEP INTO CANAAN

Cecilia stood in her bedroom in the new house. The paper in her bedroom was pink and hung in panels. At the top of each panel was a hip-diseased, and goitered cupid, who threw roses around,--roses that looked like frozen cabbages, and stuck in the air as if they'd been glued there. Father Madden had picked out the paper as a surprise for Celie. When she had seen it she had gasped and then kissed him very hard. He had said, "There, Celie, I knew you'd like it."

After he had gone Cecilia had looked around and said, "Oh, dear--Oh, dear!" Roses always had made her sick, and even to Cecilia, the paper was "pretty bad." And Cecilia had kissed him hard and said she loved it.

Some one tapped on the door.

"Come," said Cecilia.

"Father McGowan's down," said Norah with a point of her finger over her left shoulder. "An' the man's down with doughnuts, too." Cecilia laughed. Norah's mode of announcement always made people sound diseased. Cecilia had a mental picture of a man in the throes of doughnuts--with them breaking out all over his person.

"You can take a dozen and a half," said Cecilia, referring to the doughnut-man, "because Johnny likes them so."

Norah didn't move, but stood in the doorway surveying the tumbled room. A trunk stood in the centre, lid thrown back. From it exuded frills and tails. The bed was piled high with more frilly garb. Norah sniffed loudly. Suddenly, there were sobs and then she dissolved into many tears. "I dunno how we can do without yuh!" she explained in gulps. "Me, and Johnny and your paw. Aw, _Celie_!" Cecilia put her arms around the troubled Norah. She looked very near tears herself.

"I would rather stay with you, but maw wanted me learned to be a lady," she said. Her chin set. "I gotta do it," she added. "Paw promised her." Norah sniffed and took the apron from her face. "I know yuh gotta, dearie," she answered. Celie put her arms around the damp Norah. "Norah," she said, "you will be very good to Johnny and paw? When Johnny wants paw to wear collars all the time, you take him out and give him doughnuts to divert him, will yuh?" Norah nodded. She was sniffing again.

"And, Norah," went on Celie, "don't let the new cook use the blue glass butter dish everyday."

"N-no, dearie," answered Norah. She still stood irresolute by the door. "Celie," she said, "when they learn yuh to be a lady, don't let 'em learn yuh not to love us."

"I'll _always_ love you all," answered Cecilia. Her eyes filled with tears, and she kissed Norah.

Downstairs Father McGowan sat looking at a gilt cabinet decorated with forget-me-nots, and a variety of chrysanthemums never seen on sea or land. On the top shelf of the cabinet was a brick, lying on a red velvet bed. Father McGowan smiled and then sobered. He remembered a night three years past when he had pointed out possibilities to Jeremiah Madden, possibilities in the manufacture of the humble brick. The possibilities had amounted to more than even he had anticipated. Sometimes he questioned what he had done.... His hope lay in Cecilia. The boy, he was afraid, would not be helped by money. Perhaps he'd turn out well. Father McGowan hoped so. He'd bet on Cecilia anyway. She'd use money in the right way in a few more years.

There was a rustle at the door. Cecilia, in a new gown bought to wear at the "swell school," came in.

"Father McGowan, dear!" she said.

"Cecilia Madden, dear!" he answered. They both laughed, and then settled.

"Have you come to tell me to be a good girl at the swell school?" she questioned. The father was silent. He was looking at Cecilia's dress. The dress was of purple silk with a green velvet vest. There were ribbons looped carelessly on its gorgeousness too.

"Little Celie," said Father McGowan, "I want to tell you things and I can't. Now if you had a mother! Sometimes women do come in handy."

Cecilia nodded.

"I want to tell you," said Father McGowan, looking hard at the brick, "not to be hurt if at first the girls are stand-offish like. That's their way."

"Oh, no," said Cecilia. "I won't be, but I think they'll be nice. Mrs. De Pui says they're all of the best families with wonderful home advantages."

"Hum--" grunted Father McGowan. He did not seem much impressed. He still gave the brick his undivided attention. "And," he went on, "if you should get lonely, remember that there's one Lady you can always tell your troubles to. She won't laugh, and she always listens."

"Oh, _yes_!" said Cecilia, and she crossed herself.

Father McGowan drew a long breath. "Now," he said, "remember that if your clothes are different from theirs that your father has plenty of money to buy new ones for you. Remember that. A penance is all right, but not at fourteen."

"Why, my clothes are beautiful!" said Cecilia. She looked bewildered. "They're all silk and lace and velvet, and I haven't a low heeled pair of shoes. _French_ heels, Father McGowan, dear!"

"Cecilia Madden, dear," said Father McGowan. His look was inscrutable. He laid a hand on her hair. His touch was very gentle. "Most of all," he said, "remember never to be ashamed of your people, and always to love them. Love those who love you. Reason the truth out in your heart, and don't accept the standards of little Miss Millionairess, because she is that. Understand?"

"Yes," replied Cecilia, "I understand, but Father McGowan, I would always love paw. Wearing shoes and collars in the house is just the trimmings," she stated bravely. "His heart is genteel."

"Saint Cecilia!" said Father McGowan in a low voice, and then he muttered a few words in Latin. Cecilia did not understand them, but she bowed her head and crossed herself, and felt strong.

After Father McGowan left she stood in front of a mirror admiring a purple silk dress with green velvet trimmings. "Holy Mary," she said with quickly closed eyes, "help me not to be too stuck on my clothes!" When she opened her eyes she looked into the mirror. "Oh, it's grand!" she whispered. "I am almost pretty in it!" She drew a long, shaking breath.

The room in which Cecilia waited, while not at all like her home, impressed her. Most of the furniture looked old, and some of it showed a cracking veneer. The clock especially needed repair. It was a grandfather one, and had inlaid figures of white wood on the dark. Cecilia wondered vaguely if it couldn't be repaired and shone up? Dilapidated as she thought the furnishing, yet it left an impress. Two girls entered the room, they looked at Cecilia and tried not to smile. Cecilia wondered uncomfortably if her hat were on crooked, or whether her red silk petticoat hung out.

They selected books from a low case with leisure, then left. Outside the door Cecilia heard them giggle. One of them said, "Some one's cook."

"Every one has trouble with cooks," thought Cecilia. Then she looked down and forgot cooks. Her shoes were so beautiful! Pointed toes and high of heels. And her suit now, all over braid and buttons, with a touch of red here and there!

Even those giggling girls must have been impressed. Their clothes had been so plain. Cecilia pitied them. She decided to give them a "tasty" hair-ribbon now and then.... The waiting was so long. She wished Mrs. De Pui would come. She thought of paw and Johnny and her eyes filled with hot tears.

"Oh," she thought miserably, "if Johnny just won't reform paw! People are so happy when they aren't reforming or being reformed!"

Again she saw the station at which she'd started for Boston, her father and Johnny both sniffing. She was so glad she hadn't cried. She had so wanted to! Her breath caught in her throat. "Please, Gawd," she made mental appeal, "make them learn me to be a lady quick!"

Weren't they _ever_ coming?

The shabby clock tick-tick-ticked. The sun lowered and made more slanting rays on the floor. A maid, very smart in uniform, came in. She gave Cecilia a guilty look, then said: "This way. Mrs. De Pui will see you upstairs."

"Yes, ma'am," answered Cecilia. She followed humbly. The maid decided that her forgetfulness hadn't made much difference. She didn't think that _that_ would report her.... Cecilia went upstairs after the slender black figure. Her heart beat sickeningly. There were voices from the door at which the maid paused. Cecilia saw some girls sitting around a table at which a white-haired woman was pouring tea.

"Oh," said Cecilia impulsively, "I'm interrupting yuh at yer supper."

"No," answered Mrs. De Pui, faintly smiling; "come in. You are Cecilia?"

Cecilia nodded. Somehow the sobs that had been kept in all day, were, at the first kind voice, very near the surface. The girls smiled at each other. Cecilia wondered about her hat, or perhaps her petticoat hung out below her skirt? Mrs. De Pui motioned her to a chair.

"Annette," she said, "give our new friend some tea."

"How do you take your tea?" questioned Annette crisply.

"Milk," answered Cecilia, "an' sugar if yuh have it." She reddened. Of course they would have it. She wished she hadn't said that! She stared in acute embarrassment at her feet. Some one gave her a cup of tea, some one else a sandwich. She dipped it in the tea, then she remembered that that was not proper and reddened again. At that move the young person called Annette had suddenly choked and held her handkerchief over her mouth. The other girls looked into their cups, with the corners of their lips twitching.

A fat and dumpy-looking girl seated a little out of the group looked at Cecilia with sympathy. Mrs. De Pui spoke of a recent exhibition of water colours, with her well-bred tones trickling over the inanities she uttered, and making them sound like a reflection of thought.... Even the sun looked cold to Cecilia.

"I wish I was back in the flat," she thought, and then: "I wonder if I can bear it!"

CHAPTER IV

LEARNING

A month had passed. Cecilia quite understood what Father McGowan had meant about clothes. Cecilia wore no more French heels. She had taken down her hair and discarded her beautiful rhinestone hair-pins. Father McGowan too, it seemed, had been responsible for her admittance to the school. Cecilia had found out from Mrs. De Pui that he had written a book! This astounding fact had been divulged after Mrs. De Pui, more than usually tried by Cecilia, had said: "Your entrance here has been rather difficult for me. You see, of course, that the other girls' advantages have not been yours?"

"Oh, yes, Mrs. De Pui," answered Cecilia, and swallowed hard.

"Realising that, my dear," continued Mrs. De Pui, "I hope that you will do your utmost to develop a womanly sympathy, and broaden your character."

Cecilia said somewhat breathlessly that she would try to, very, very hard! "And," went on Mrs. De Pui, then coughed, "desist from the use of such words as 'elegant,'--'refined' (which, when used at all, is re_fine_d, not 'r_ee_fined'), and 'grand.' Such words, my dear Cecilia, are not used in----" (Mrs. De Pui nearly said polite society, but swallowed it with a horrified gulp) "are not used by persons of cultivation," she finished weakly.

Cecilia vanished. She went to her lonely room. (There were no room-mates.) She settled on the bed. By the bed, on a chair, was a pink silk dress. It had been her star play, and after a month of boarding school she was going to give it to the maid. The maid was _so_ friendly!

There were two letters on the small dressing table. Cecilia got them and read:

"Celie girl, we miss you. It ain't like it was in the house. I hope they are learning you good and the board is good. I hope they treat you good. Father McGowan was here last night. He sez he will go to see you soon. Johnny is well. Norah sez your cat is lonely too. Your father with love,

"J. MADDEN."

The other was a line from John. A petulant line, full of querulous complaint of a collarless father, redeemed to Cecilia by a word or two at the end.

"You were so good to me, Celie. I know it now." She threw herself down on the bed. Her shoulders shook miserably. Tears wet a once loved pink silk dress, "all over beads and lace."

Upstairs in another room, a group of girls were laughing uncontrollably. "You know she actually invited Annie to _sit_ down!" said one. (Annie was the slender maid.)

"That is not r_ee_fined," answered Annette. There was more wild laughter.

"_Do_ ask her up to-night," suggested a tawny haired maiden with cat-green eyes. "_Do!_ It would be simply _screamingly_ funny!"

Annette, although one of the most unkind, objected. "It doesn't seem quite nice," she said. However, as the idea promised fun, the majority ruled.

Cecilia answered the tap on her door. "Come up to your room to-night?" she echoed after the invitation. "Oh, Miss Annette, I'd be that glad to come!" she smiled, and her smile was like sunshine after rain.

"I _do_ thank you!" she said. "I do!"

Annette turned away. Cecilia closed the door, then she covered her eyes. "Gawd, thank you ever so much!" she whispered, "thank you! I _have_ been so lonely! Make them love me. Please make them love me, Gawd." Then she lifted her head. Her face shone. "I wonder what I shall wear?" she said.

To meet the ideal of one's dreams while carrying a sick cat is humiliating. And that is what happened to Cecilia Evangeline Agnes Madden. Her shadowy dream-knight had materialised into human shape through a photograph. And she met him while chaperoning a sick cat.

Two weeks before she had gone to a party in Annette Twombly's room. She'd not enjoyed the party very much, in fact she'd been rather unhappy until she saw the photograph. After that she didn't care what happened. All the romance of the Celt had leaped.... Her shadowy dreams took form. The ideal lover developed a body.

"Oh, your _heavenly_ cousin, Annette!" said the green-eyed. "I _adore_ his hair!" She stood before a large photograph, framed elaborately.

"He _is_ a sweet boy," Annette had responded, "but so particular! I never knew any one quite so fastidious. It is _fearfully_ hard to please him!"

"Does he get crushes?" asked the green-eyed.

"My dear," said Annette, "it would be impossible. He's terribly intellectual and all that, and girls so easily offend him. He doesn't say so, but he simply stops paying them any attention."
